be high until 1948. The year 1949 was the peak year for the production of tweed, with over 4,000,000 yards stamped, of which 2,065,000 were stamped, and some 1,500,000 unstamped). In 1948 the proportion of unstamped tweed had risen to 500,000 yards but stamped tweed came to 4,580,000 yards. Finally, to the productive income earned on the Island there should be added that received by earnings sent to household home to dependants, together with pensions, unemployment relief and the like. I am grateful for the help of the appropriate officials for the figures cited for 1937-38 of the year immediately before the war, and for those for 1948 and 1951 (compilation for losses was short-lived. The outlook is disquieting.

(iii) Agriculture, Peat-making and House-building, 1938

(a) Agriculture.—The estimated agricultural output shows total value of £189,500, of which of this total the quantity fed to animal was valued at £40,000. "Peat-cutting" for Lewis groups of well over £250,000 and more, probably £275,000 for the period. Adding the total of the wages paid in Stornoway and also of carters, dockers, etc., it is thought safe to double the figure, with £550,000, for Lewis, rural and urban. Most of the weaving is in Lewis, Stornoway is the port and carters ports allows rural dwellers to come to Stornoway daily to earn and so have a regular income, and to spend money on spinning and other labour. For rural carters and mill employees, a little of £275,000 is taken here, making £250,000. As an estimate for the 'net earnings' in Lewis is available, the same ratio to wages is taken as in 1948, making £250,000.

(iv) Agriculture, Peat-making and House Building (1953)

(a) Agriculture.—First, the trend of crop and stock production can be indicated by selected figures for the Island for 1948, 1950, 1952 and 1953. The same both of oats and rotation grass increased, the three successive totals in acre being, 1,[illegible] oats; 4,460, 5,200, 5,440; and for rotation grass: 390, 1,[illegible]

197 Thus, towards the end of the nineteenth century, the proprietors were stripped, by
198 presence of population, skills, and of public opinion ~~without~~, to make some improvement
199 in their small estates. It may be relevant to point out that this was the time when agricultural prices and declining farm rents. Infact the time was not for all when some
200 farms would not find a tenant at any price.

TABLE 7

Farm:	c. 1875/80	c. 1880/90
Meaisten	£130	£40
Mangerton	£150	£65
Ardtoe & Corrach	£285	£240
Glengarry	£100	£80 (1)
Lochaber	£340	£270 (2)

Notes: (1) Small reduction for enlargement in Glebe.
(2) £12 reduction for Lainemadder and Grimerata Lodge.

The crofters of south Uig were in particular difficulty at this time for here fishing
201 was not a viable alternative. Lack of harbourage, the distance from markets (Stornoway in 1918
202 Tarbert and Kilbrae, had Glenelg families, James of Shaw sharing crofts with Gillies
203 tenants), and three of squatters, i.e. on the common pasture. Here fishing had almost
204 ceased and the people were almost entirely dependent on their crofts or on employment away
205 from home. In Valtos and Kneep there were 21 cottar families: they had 21 crofts and
206 21 cottars. Valtos was a village of 21 families, Kneep of 14 families, Kneep was a village
207 of fishermen and weaving was developed in both Sig earlier than in most parts of Lewis. As
208 early as 1900 Uig was classed with Harris, by the local committee of the Congested Dis-
209 tricts Board, as producing a superior quality of tweed. Of the 1000 people in Valtos and
210 Kneep, 500 were weavers, 200 were fishermen, 200 were crofters and 100 were men who
211 went to the U.S.A. also made grants for roads, footpaths and "marine works"
212 Enough for labor the year at Valtos (1897) was an attempt at a harbour, but it came too late.

The Congested Districts Board was the first government agency with funds at its
213 disposal to aid the crofting township. One of the largest grants went in aid of the Cultivation
214 Society (or Portland Road as it is now known). This scheme across ran of an abortive pro-
215 posal for a railway from Loch Carloway to Stornoway. It was thought that the lands
216 adjacent to the road would be ideal for crofting and that the crofters would be more in
217 clusters and so be the assigned which the fishing vessels returned in any with minimum
218 delay. The road, an excellently engineered one, is still not properly surfaced. A more
219 ambitious C.D.B. called scheme was the establishment of crofters on Sheegarrah Farm.
220 Here a village was built and the land was divided into crofts. Some of the people
221 thereon are buildings were formed here and the first harvest was taken by the new
222 tenants in 1911. The crofters' rent was fixed at £75 and the C.D.B. gave £1000 in grants
223 to purchase the sheep stock and improvements, and towards the cost of fencing. Almost
224 the whole township was fenced and the sheep were kept in a large fenced area. Sheegarrah
225 was a success and its example influenced all Uig. Since most crofters had small holdings
226 needing coordinated schemes were raised by the Crofters Commission where
227 experts regarded the scheme as essentials. Both here since been re-zoned by crofters.

235 Sanford and Harness. but most crofters had less farm-this is one hundred and twenty.
236 Matters are sold at least the place and when the nation is made a fact.

237. Farm of the common pasture - usually the machair, are set aside for wintering hogs
238 and sometimes cattle. Some of the common pasture is arable land. The most so a whole.
239 Not enough of the common pasture is arable to make it worthwhile. Some of the
240 Valtos in Lemreway and one share within a crofter to winter twenty-five hogs
241 and sometimes a few cattle. Some of the common pasture is used for the grazing of
242 the machair - in practice it is the best bigger that are sets. The minister at Timsgarry
243 has a share in the common pasture and winters twenty-five hogs and cattle. Not
244 crossing the Stornoway Stadhlaigh with Seaforths and hence seem to be very small.
245 the minister is more attentive to his sheep than are many of the crofters, but some local
246 men are interested in their crofts. The lighting percentage, so dependent
247 upon the winter and spring weather, was about 80% in 1959 and this was regarded as good.

248 Enquiries since that date crofts in township but not crofters, have been made
249 because where carry on stock the four townships are understocked according to the total
250 area of the common pasture. Thus in Valtos in Timsgarry approximately 1000 sheep
251 are kept. Crofters have of course by 1959 - the Valtos crofters have sold their sheep
252 some of the figures used for sheep stock were approximate or estimated. Nearly all crofts
253 keep some sheep and hogs are sold to the grazing men.

The rhythm of work on the croft during the year is shown on Figure 16, overleaf.

Part of the hill common west of Crowlista was cultivated until the beginning of the
254 twentieth century and the people were almost entirely dependent on their crofts or on employment away
255 from home. In Valtos and Kneep there were 21 cottar families: they had 21 crofts and
256 21 cottars. Valtos was a village of 21 families, Kneep of 14 families, Kneep was a village
257 of fishermen and weaving was developed in South Sig earlier than in most parts of Lewis. As
258 early as 1900 Uig was classed with Harris, by the local committee of the Congested Dis-
259 tricts Board, as producing a superior quality of tweed. Of the 1000 people in Valtos and
260 Kneep, 500 were weavers, 200 were fishermen, 200 were crofters and 100 were men who
261 went to the U.S.A. also made grants for roads, footpaths and "marine works"
262 Enough for labor the year at Valtos (1897) was an attempt at a harbour, but it came too late.

263 It is obvious that crofting no longer affords a livelihood to Ardtoe. the only two families
264 without ancillary occupations are those where all the members are aldefly. Of the others
265 some are employed in the weaving trade, some in the fishing industry, some in
266 construction capacity at the R.A.F. station and there are fifty regular weavers.

267 Aird and is in a well-contoured township, the land was fully cultivated and a certain
268 amount of cutting was carried on in spite of the difficulty of cleaning up the lands over the
269 rocky beach. Now it is prosperous, the very much dependent on the R.A.F. station, and
270 if this should ever close down, most of the younger people would have to leave in search of other employment.

CHAPTER SEVEN

VALTOS, KNEEP AND EERE

by

David G. Symon.

On the eastern side of the Aird peninsula, facing east to Loch Roag is a township
271 of three villages, Valtos, Kneep and Eere. Valtos is the largest of the three, with 21 families
272 living in 21 houses. Kneep, inclusive of Valtos, Meavaig, Valtos, Valtos, and several
273 smaller islands, comprises the territorial limits of the township of Valtos, Kneep and
274 Eere.

This secondary pastoralism is accidental to the extreme, with outcrops of bare rock and
275 thin soil. Nevertheless it is in this hill land that the Norsemen intense interest was
276 frequently of Uig Bay. The raised roring house and place at Crowlista, and the "port
277 of the Norsemen" at Eere near the site of the Clachan in Crowlista, point to the Norsemen
278 interest in this area.

At present the wearing of Harris tweed from yarn supplied by the Stornoway mills is
279 the main occupation of the people. There are two mills in Stornoway, one at Tarbert, another
280 three in Timsgarry and two (plus one other weaver) in Crowlista. All these towns were
281 in use and two tweeds were in a weak loving in a semi-crofted way for the supply of weaving is
282 irregular. The future security of these weavers depends on the prosperity of the Harris
283 tweed industry.

Machair's sand and gravel quarry at Carnish provides employment for from three to
284 five men. Some of the men are from Crowlista and are from Crowlista. Carnish is growing
285 in size. Some of the men are from Crowlista, one from Crowlista, one from Kneep, one from
286 Valtos. Some of the men are from Crowlista, one from Kneep, one from Valtos, one from
287 Valtos. Some of the men are from Crowlista, one from Kneep, one from Valtos, one from

pulled out of Lewis to go south to Harris, 159
offered—such was the character of the man—as thanks for 175*
'98 per cent support' he got from the people of Lewis, to each 423
vis crofter his own croft as a free gift, and the Lews Castle, 431
ether with all his property in Stornoway, to the people of the
n.

n 1919, Leverhulme became proprietor of Harris, and con- 159
trated his efforts in Obbe, now called Leverburgh, in South 175*
rris. The harbour at Obbe lacked the natural advantage which
rnoway had, so he spent large sums on making it navigable. [503]
cky obstacles were blasted away; numerous buoys and beacons [228]
e set up to guide vessels into harbour; new quays were built;
l kippering sheds, and other buildings necessary for packing
l curing herring were erected. Among his other undertakings [288]
Harris were the provision of a mill for making tweeds, and he [491]
e half the cost of the 5½ miles of road between Leverburgh
l Finsbay. In 1925, after a visit to the Congo, he died in Brus-
. His Harris schemes came to an abrupt end. And the remains
industrial history are still to be seen in the quietness of the
e township named after one of the most stormy of business
rels that Britain has ever seen.

urism

Tourism has always been a perfunctory and casual affair, until 484
introduction of the fast ferries which now link the mainland [501]
a Skye) with the Outer Isles. Some 10,000 cars cross each year [505]
m Skye to the Hebrides. In 1913, the Stornoway Tourist
ociation had a struggle to increase the number of visitors to
town, to establish it as a tourist resort. It is much the same
lay with the Western Isles Tourist Association, which is having
ficulty in integrating tourist facilities with crofting activities. In
wis, the Stornoway Trust has assisted in establishing pony-
kking, a venture which has the potential to mirror the success
a similar one in the Isle of Skye.

PRESENT INDUSTRY

most an echo of the kelp-burning industry is the alginate in- 824
stry. It provides employment for only small numbers, but is a 381

[Seforthhe-1] [Shielderniah] [Habost]

suppression of the original townships opposed to six today. As a result, many lazy-beds, now given over to natural grass, are being gradually encroached on by heather and juncus. Out of the present population of twenty, three, one is permanently away and two have migrated since 1939. There is a more healthy population structure, with a large number of males between 15 and 44, due to a large family having returned home and six children, five of school age.

In Seaforthhead and Shielderniah all settlement is below the road and house-sites are on slight elevations. At Seaforthhead is the reputed hunting lodge of the Seaforth's, 'Seaforth Castle', now ruined, but still showing signs of abnormal size and arrangement. When first settled, communication was by ferry (1820). Now a cart-track, deeply rutted, to Eisean Lodge gives access to the Tarbert-Stornoway road two-and-a-half miles away.

SHILDERNISH

Shielderniah, also consisting of three crofts, is better situated on the Park and South Lochs road. The three houses are situated on a well-drained northerly slope, half-way between the road and the shore, but the three crofts are on better land and greater accessibility has led to better management and new ideas.

Cultivation in isolated patches reaches up to nearly 100 feet and the lazy-beds have been put together to permit ploughing by horse or tractor. One croft grows neither oats nor potatoes, preferring to enclose two one-acre parks, re-seed them, cut the hay in June, and water the lambs on the aftermath. By next year, this crofter hopes to have enclosed and re-seeded a further acre and will then use the three in rotation. The other two crofts grow both oats and potatoes and one is also sowing down. The crofts average fourteen acres in size but although gentle slopes are extensive, the major part of the croft is in permanent pasture. The total stocking of the Shielderniah crofts is below the township average. Fishing is now only for domestic use though there is a small jetty on No. 1. Part-time weaving is performed on two of the six crofts.

The future pattern would appear to progress to more grazing and less cultivation. Two out of the six crofts - both at Seaforthhead - are worked from outside the township and this isolated township, being difficult of access and having little cultivable land, is better suited to grazing. Shielderniah appears more suitable for enclosing parks for fattening lambs, as soils are deeper and slopes gentler, making the use of a tractor feasible. More could be got out of the croft especially with fertilising and re-seeding for hay and pasture and growing fodder crops for wintering. It is hoped to fence the common securely, and then stock will be improved - a great necessity. Daily communication with Stornoway also means that fresh fish is better placed than Seaforthhead for a fishering settlement. The crofts are certainly of a workable size - provided part-time work, such as weaving, is maintained, along with the grants from the Crofter's Commission.

HABOST

Rachel A Hirst

Habost is scattered around a small bay on the south shore of Loch Erisort. Settlement stretches for over a mile eastwards on three small hills separated by wide, well-drained valleys which soon rise to the dominating Craigeal (225 feet). Slopes are varied but tend to flatten out at about 100 feet near the road and on the flats, most of the cultivation takes place. Nearer the shore, slopes are much steeper and on the hills there are bare rock faces and thin soils.

[Habost]

Drift is found near the shore and taps round the three hills nearly up to the road, predominantly heavy clay with small boulders; this is replaced above the road by peaty loam on rock. At one time, here was grawn on the heavy drift. There is peat accumulation on the flat land near the road to a depth of about six feet and there are one or two peat banks in former years when he had used the spade. The answer to this was given by one of the other pioneers, who thought that time saved could be devoted to some other profitable occupation, for example, weaving. Six of the crofters practise a five-year crop rotation, sowing potatoes first, followed by oats under-sown with clover which for the following three years is cut for hay.

An interesting experiment has been that of the improvement of two-acre of common grazing land by the road on the west side of the township, by sixty tons of lime and fertilisers, spread during the evenings. The work began early in Spring when 6 tons of lime, 10 cwts. of mineral phosphate and 5 cwts. of sulphate of ammonia fertilizer were spread at the owners' own cost. The grass seed was sown in July, the most favourable time for sowing since there is less danger of a drought than earlier in the year, and more convenient for the crofters who have to be born in March so that they are six months old in October for the Garyvard sales. The cows are served by an Aberdeen-Angus bull from Croibeg Farm. The township gaigs are opened in October and the cattle remain within the bounds until May. An interesting regulation enforced by the Grazings Committee is that each family can have only one dog, and that it cannot be taken on to the Common grazing without special permission, or on task days.

Shielings, situated on the common grazing between Calbost and Cromore, were used until the 1890's. Active land was not considered, and was gradually declined; in the 1920's, much of the moss was used at Balallan. Prices for calves are normally better in Spring than at the Autumn sale, nevertheless prices could be expected to be low. Even so, it is usually a profitable venture for a crofter to part with the animal rather than bear the cost of taking it back to the croft and wintering it there. Naturally there is some uneasiness in the community at the suggestion that the middlemen who buy these animals will sell them at much higher prices on the mainland at Dingwall. Sheep are normally sold in Stornoway to the butchers but also at the local sales.

Crofting is not in itself a lucrative form of employment and in most households there is at least one other source of income. A majority of the crofters have regular employment, two working in quarries or on the roads for the County Council, another is postman, three are weavers, another is both weaver and contractor, while yet another works in Aberdeen waters aboard a fishing factory ship for eight months of the year. Weaving is undoubtedly the most lucrative of the ancillary occupations, though the weavers are suffering at the moment from the slump in the Harris Tweed industry which is also affecting the prices for wool. Contracting is also a paying proposition for one or two persons only, since the amount of freight is obviously limited.

Most crofters own a small rowing boat and it is not uncommon to see half a dozen nets set in Loch Erisort on any fine evening during the Spring and Summer for the catching of sea trout, largely because of the scarcity of fish near the coasts, and partly because of the isolation of the area and the enhanced difficulty in marketing. The Fleetwood trawlers are regarded as pirates in the Minch, and one has to re-credit the destruction of two long lines - the sum total of the tackle belonging to a local boat. To have eighteen pounds worth of gear lost in one night is ruin to a crofter-fisherman. Lobster fishing has died out at Garyvard though it could be quite epsteinively practised.

The main road from South Lochs to Stornoway through the village has obviously had a profound effect on the township. The sites of the old 'black houses' have been abandoned when new houses have been built, in favour of sites conveniently near to the road. The Road Age has greatly lessened the distance and time taken to reach Stornoway. Cultivation has not been the majority of crofters in Garyvard use artificial fertilisers, whereas they are scarcely used at all in Caverata where the road ends about 50 yards from the nearest house.

[Garyvard]

Only a fraction of the total arable land is cultivated by tractor and this is divided among seven crofts. In spite of an emphatic statement by one of these cultivators to the effect that he will never use it again, the use of the tractor will increase as soon as the pioneers are able to prove to their neighbours its capabilities and as soon as the lazy-beds are joined together, an improvement which has already taken place in Habost. The main objection to the use of the tractor for the smaller crofts is that the inevitable one that the yields were always lower than in former years when he had used the spade. The answer to this was given by one of the other pioneers, who thought that time saved could be devoted to some other profitable occupation, for example, weaving. Six of the crofters practise a five-year crop rotation, sowing potatoes first, followed by oats under-sown with clover which for the following three years is cut for hay.

An interesting experiment has been that of the improvement of two-acre of common grazing land by the road on the west side of the township, by sixty tons of lime and fertilisers, spread during the evenings. Contracting is also a paying proposition for one or two persons only, since the amount of freight is obviously limited.

Most crofters own a small rowing boat and it is not uncommon to see half a dozen nets set in Loch Erisort on any fine evening during the Spring and Summer for the catching of sea trout, largely because of the scarcity of fish near the coasts, and partly because of the isolation of the area and the enhanced difficulty in marketing. The Fleetwood trawlers are regarded as pirates in the Minch, and one has to re-credit the destruction of two long lines - the sum total of the tackle belonging to a local boat. To have eighteen pounds worth of gear lost in one night is ruin to a crofter-fisherman. Lobster fishing has died out at Garyvard though it could be quite epsteinively practised.

The main road from South Lochs to Stornoway through the village has obviously had a profound effect on the township. The sites of the old 'black houses' have been abandoned when new houses have been built, in favour of sites conveniently near to the road. The Road Age has greatly lessened the distance and time taken to reach Stornoway. Cultivation has not been the majority of crofters in Garyvard use artificial fertilisers, whereas they are scarcely used at all in Caverata where the road ends about 50 yards from the nearest house.

[Cromore]

The crofters sowed

clover with their oats in 1957; the quality of most of the natural grass could be improved considerably by extending this practise. Several of the crofters have taken advantage of the facilities for obtaining lime and fertilisers, but seaweed and byre manure are widely used. Only seven crofts have cultivated since this year but that of No. 23, (partially enclosed by a dry-stone wall) has produced crops of lettuce, cabbage, turnips and carrots.

The scouring for Cromore is one cow, one heifer and eight sheep per £1 rental, but is not enforced. The crofters keep the sheep which they can manage to maintain through the winter and no one appeared to be dissatisfied with this arrangement. In fact the scouring is exceeded by only seven crofters and the total stock for the township is only 75 per cent of the scour. Lambing takes place in April and May and often a high proportion of ewes and lambs is lost. The sheep are clipped in July and each crofter usually clips his own sheep. He either sells the fleece or has it spun in Stornoway before weaving it himself. The lambs are taken from the ewes during the second week of August and then dipped; November is the tupping period and almost every crofter had his own ram. The cattle are left to graze on the hill all the year round. The crofters like the calves to be born in March so that they are six months old in October for the Garyvard sales. The cows are served by an Aberdeen-Angus bull from Croibeg Farm. The township gaigs are opened in October and the cattle remain within the bounds until May. An interesting regulation enforced by the Grazings Committee is that each family can have only one dog, and that it cannot be taken on to the Common grazing without special permission, or on task days.

MARIVIG

Pamela Gough, B.A.

Marivig is situated on the western and south-eastern sides of Loch Marivig, a small triangular inlet opening to the north-east and well sheltered from storms and swells by Torray Island, making the loch ideal anchorage and harbour.

The land rises steeply from the shore of the loch for twenty-five feet to fifty feet, then slopes more gradually and irregularly, with frequent precipitous rock outcrops, for two hundred to five hundred yards to the rise steeply to a line of low hills, two hundred and fifty feet to four hundred feet high, surrounding the loch. All crofts thus have an easterly or north-easterly aspect, not particularly favourable for cultivation, and only one has any appreciable area of land uninterrupted by rock outcrops. Soils, derived from glacial drift, are unevenly distributed, thin, and very stony, and cultivable areas are thus small and widely dispersed.

The surrounding hills, which form part of the eight hundred and sixty-three acres of common grazing, are mainly covered with heather, moor grass or sphagnum bog, while the lower areas within the township are grassy, but drainage is poor, and rushes are widespread. Bracken is not yet a problem, and only small areas exist, mainly on the lower slopes of the western side of the loch. A few swans and willowe survive here also, but otherwise the area is devoid of cover.

There are twenty-four registered crofts in Marivig, twenty-two being inhabited, one vacant and one occupied by a bachelor who has never lived on the croft. Holdings vary in size from one acre of two crofts, one of which is on the common, all the boundaries run from the township dyke, which closely follows the two hundred foot contour, to the sea in radial fashion (Fig. 4). The size of the crofts varies from 1.25 acres to 22.25 acres but only seven crofts and less than four or more than eight acres in size. No croft has more than three acres of land which has ever been cultivated, and few cultivate more than one acre. There are thirteen cottars and squatters, five houses being on the common, three of them cultivating small areas adjacent to their houses.

Cultivation is exclusively by spade on the 'lazy-bed' system. Owing to the rocky nature of the terrain, the 'lazy-beds' are narrow, often only one or two yards wide. Potatoes and oats are grown in rotation, and hay taken from lazy beds left fallow. Very few crofters now grass for hay or underwrite their crops. Dung and seaweed are used as fertilisers, with potash fertilizer as the most general 'artificial'. Small enclosed gardens, often somewhat neglected, produce lettuce, carrots, cabbage and soft fruits on about half the crofts, but no garden produce is marketed.

[Ur-vir] [Marivig]

beds are now covered by sphagnum moss and heather. Other lazy-beds are permanently immature and, only thirty per cent of the land classified as 'mid arable' is now in use and potatoes. If natural hay is added, one hundred and thirteen acres of crops are taken from an area greater than the so-called old arable; this suggests that the cultivated area was pushed beyond the limits of the old arable (ninety acres) after 1850-52. As in all the fishing townships the area of sown grass is infinitesimal for only the four of the fifty-eight operative units actually have a grass ley. The wintering capacity of the crofts could be greatly increased by the general adoption of the practice of under-sowing.

There are forty-three legal crofts in Gravir but nine are sub-let, in every case to relatives. All the crofts are taken up and there is evident pressure of population on the land. In addition to the crofts, there are a further ten cottars, and squatters and four landless families (legal). Glengravir crofts (ten operative units) share in the Gravir common and the population has been encroached on by several feus for Gravir is the functional centre of Park: the Free Church of Scotland and Manse, the Hospital, one of the two district nurses and two of the missionary (assistant ministers) are all located in Gravir.

Gravir and Glengravir then have fifty-eight legal crofts and fifty-six operative units. Less than half of the crofts with grazing rights are fully stocked; the quarter has stocked the quarter has stocked the other fifty per cent of the scour, including five without any stock. The common pasture of 6,652 acres is in general of poor grazing quality, dominated by the less nutritious species of grass and poorly drained. In 1957 a ten acre plot was fenced and re-seeded; only twelve of the operative units participated in this reclamation work, and the ages of the participants ranged between 27 and 64 years. Besides the fifteen legal Glengravir crofts (ten operative units) all share in the Gravir common.

Crofts can be extended only if adjacent to arable land, which can be easily or not such work. This scheme could be extended annually; if potential improvements to the crofts are limited, pasture amelioration is virtually impossible. Only a few crofts have arable land which could stable better stock to be kept rather than greater numbers; at present the sheep stock is over two hundred per cent of the sheep scour, and a few are taken out for sale at a little at £2 the to £3 10s. an indication of the consequence of overstocking. The cattle stock is below the scouring and this paucity of cattle is one of the notable changes in the agricultural culture since the 1930's for at that time as many as six cattle were kept on the larger crofts. The total stock kept in Gravir and Glengravir exceeds the scouring by thirty-five per cent.

The great majority of the crofts can certainly not be considered economic units. Crofts with the scouring of one cow and follower and eight sheep per pound sterling of rent in a township where sufficient arable land is available to be used for the production of feed for the supporting agricultural units. The produce of two cows and sixteen sheep, with potatoes, and in former days, barley or oats, locally milled by the three Gravir water mills, could scarcely ever have maintained a family. Fishing was the complementary economic activity, and in 1901 no fewer than nineteen boats and eighty-nine lobsters were registered at Gravir. Today, only one boat fishes commercially for inshore fishery.

If agriculture is singularly unrewarding, weaving occupies six of the males of insurable age on service occupations a further ten males and five females, but neither weaving nor service occupations are sufficiently available or attractive to keep the insurable population in the district. Twelve of the males between fifteen and sixty-four years take seasonal employment and forty-six are in permanent employment forty of them in Lewis, in all sixty per cent of the potential male reserve population.

The economic problem of Gravir, in common with the other 'fishing' townships, became acute after the fishing industry collapsed after 1914; in the bay-day of the fishing most of the men fished all the year round, locally and on the west and east coast of Scotland. Earnings fluctuated but a man might make as much as £90 in a good year or as little as £5 in a poor year. Apart from the of young cattle, and wool surplus to home spinning requirements, the fishing earnings constituted the bulk of the croft income. Today, on the basis of the scouring, the income of the largest croft including subsidies could only be approximately £150 excluding the amount to be set aside for home consumption of potatoes and milk.

[Zevric] [Dingravric] [Lamrovy]

The urgent need in Grantir is a reduction in the number of holdings. A pre-requisite of such a reduction would be the creation of a new centre with a sizeable population. Weaving and fishing are the more obvious occupations; the former is subject to world trade fluctuations but the latter is now in a more favourable position since the introduction of the having fishing guaranteed markets, although the raising of the initial capital for buying and equipping boats is a formidable problem. Of the present population there is a large number of young and non-existing. The outstanding feature of the present-day population is the absence of young people. The urgent need for this present trend is that the migrating section of the community comprises the younger and more enterprising people. Unless holdings of economic size can be found, and stable employment introduced, one can expect the younger men and women to remain in Grantir.

Until a major reorganisation of the croftin is carried out, a vigorous attempt to re-send large areas of the common pasture to the former arable condition, and the development of a viable tourist industry, are interim possibilities. It is not sufficiently realised in croafting districts that there is a demand from the city dweller for unspoiled countryside and good plain fare in a clean atmosphere, with the possibility of hill walking and fishing on fresh and salt water. Yet, until the proposed water-scheme becomes a reality, tourism on a moderate scale can hardly be contemplated.

One can only conclude that until reorganisation takes place and transformer Grantir into a township of viable agricultural holdings, and provision of the harvest outside is not of the question, a decline in the number of holdings is inevitable in the long run but a planned reduction over a number of years would bring about a more stable community than the disintegration which will occur without such planning. Until this is achieved, the young men and women have little incentive to remain in Grantir.

LEMERWAY

Beth Bioweyn, Brenda G. Turner and John E. Wearmouth

Lemreway, the southernmost township of Park, comprises 290 acres arable and moiron divided into thirty-three croafts and 3,325 acres of common pasture. The township is situated on the northeast side of Loch Shell round a bay in the shelter of Eilean Isward.

The township consists of three distinct areas. A flat, poorly drained area of about 100 feet, percommon pasture and part restricted to crofters, is bounded by a rocky knoll, the Dotard Corrie, to the first subdivision. The second area, further west, is of a hummocky nature. To the east, a steep rises to an altitude of 400 feet, less than half a mile inch distant. Tumbledown dykes and Two benches are to be seen at about 100 feet on the steeper slope and similar, though wider terraces occur at the same height to the north. It is suggested that the flat area is the bed of a shallow-drained lake, and that the hummocky sector is partly moraine and partly ice-eroded rock exposure. A channel eroded through this sector allowed the lake to drain southwards leaving a relatively deep; incised valley through which the present stream flows to the sea.

Soils may be divided into two types: a peaty loam over the lower and better drained gravelly loam which is found to the east and along the main stream; the latter is particularly suitable for potato cultivation.

Except on rocky outcrops, the very steep slopes and the drained areas, blanket bog predominate. Sphagnum here is rarely dominant but where the land is badly drained Deer's hair grass (Scirpus cespitosus) and cotton grass (Eriophorum vaginatum and Eriophorum angustifolium) are the dominants. On slightly drier land,purple moor grass (Molinia caerulea) and red grass (Agrostis stricta) are abundant. Local dominants are bog asphodel (Narthecium ossifragum) and cross-leaved heather (Erica tetralix) with other common species such as the sundews (Drosera rotundifolia and intermedia),butterwort (Pinguicula vulgaris), Junior sp., Carex sp. and Carex panicea occurring sporadically. Where the peat has been cut and drained, heather most usually develops and Calluna

[Lamrovy] [Grisaig]

The West Highland Grantir Township Croft Association (Grisaig) is predominantly a fishing township. The remains of an old camp site are visible today and wood 1747 dated metal detector survey, indicate Lamrovy to be the oldest of the Grantir townships. Lamrovy has been occupied for more than 200 years but was hard hit by the clearances of the nineteenth century. Today there is one fishing boat which lands its catch in Moreforer working with modern equipment, drift and ring nets, it provides a regular income for a crew of six.

An examination of the population statistics proves interesting, especially when compared with those for Grisaig. Lamrovy's resident population of just over 70 males and 70 females is large considering that there are six unoccupied croafts. Eleven of the croafts have gone than one house and the cofter population forms over a third of the total population. Of the total population 15 are under 15 years of age and 15 are over 65 years of age. Only 15 are between 15 and 65. With over forty resident under the working age group, Lamrovy provides a striking contrast to other croafting townships in Park.

Fourteen of these men are full-time croft workers, while nine others find work in ancillary occupations such as weaving and fishing. A further eight are retired men who, while not regarded employment - a postmaster and a postman, a bus driver, a lorry driver and several weavers. Just over thirty people work away from the township permanently, fourteen in the Merchant Navy and nine girls in domestic service, while a further nine engage in seasonal work.

Contrasts from the township of Grisaig are striking. Only one man is working away from the township. Nevertheless, Lamrovy has a larger proportionate resident population than most townships.

Only four thatched houses are occupied and housing conditions are generally good. Every house has electricity, but, with four exceptions, water has to be carried from springs and wells. Most of the present houses were constructed in the last twenty years. Lamrovy has no croft houses. Two croafts are occupied by men who are retired from the trades, and these were built either along the shore or up the slope to the shelter of the hills where the house was near the sheep, the peat and the springs. Today supplies of food, peat and even seaweed are brought by road.

Mention must be made of the possibilities of the tourist trade in Lamrowey with its most attractive situation and reasonable road communications. An approach has been made to the Scottish Youth Hostels Association and while hostellers could not greatly increase the income of the residents, the hostel would be a good centre for those who wished to explore the surrounding hills. Less than relative to the croafters, it should be noted that it is more than at least three houses could be used.

It is possible to be optimistic about the future of Lamrowey, as at the moment considerable enterprise is being shown. A Ferguson tractor, bought this year by a man returning from wining. I am example. It is to be hoped not and could be put to good use by some enterprising croafter. There is also interest. The attempt to improve the common pasture and the new extensions to newly planted house are all indicative of considerable enterprise in croafting. The old women, though not regarded as employment, are a valuable asset to croafting community, for they take care of the young children while their mothers are being employed in outdoor work and croafter-weaver, croafter-postman and croafter-bus driver are the contemporary employment combinations.

The pessimism and apathy noticed in many croafters is to be found in Lamrowey but above this is the impression of enterprise. If the croafters can continue to adapt itself to changing conditions, it may be able to combat the 'drift to Glasgow' and continue as a successful community.

ORINSAY

Beth Bioweyn, Brenda Turner and John Wearmouth

Orinsay is a small croafting township clustered, in the form of a horseshoe, around the head of a sheltered bay on the northern side of Loch Shell. Most of the houses are situated within fifty yards of the shore on a narrow strip of land, beyond which, the croft extend from the shore on to the moor

1. The Directors of the Croafting Survey are grateful to Dr. F. Fraser Darling for granting access to the individual Township Cards, which are a storehouse of information. For detailed contents of the cards, see West Highland Survey p. 247.

Recent trends also point to a decline in the numbers of sheep, although more are kept now than fifteen years ago. Some of the croafters have lost their sheep stock (243-345). A great deal of hard work and money have been a result of the own subsidy, but part at least may be connected with the sea and part may have been due to the fact that the sheep stock could not be expanded. Today there is one fishing boat which lands its catch in Moreforer working with modern equipment, drift and ring nets, it provides a regular income for a crew of six.

All the croafters keep some sheep although individual stocks vary from 15 to 150. For most of the year these sheep are grazed on the common pasture on the moor or on the sightseen area (island in the bay. In August, however, the lambs are gathered in for weaning and dipping. In November the gates are opened and all the sheep allowed to graze on the clearer pasture within the croft. Ewes are brought into the working age group. Lamrowey provides a striking contrast to other croafting townships in Park.

The total area of the common pasture, which is mainly heather, the most of it consists of hummocky, waterlogged and stony ground, supporting only poor quality coarse grasses and sedges. Over 700 sheep are grazed this area and the carrying capacity of the common pasture is certainly drastically over-stocked, with an improvement in drainage, one might be used in the two valleys.

It is not an easy to be optimistic about the future of Orinsay. The population resulting from the clearances of the nineteenth century has continued in the fishing industry could absorb most of the men. A great deal of hard work and money have been a result of the own subsidy, but part at least may be connected with the sea and part may have been due to the fact that the sheep stock could not be expanded. Today there is one fishing boat which lands its catch in Moreforer working with modern equipment, drift and ring nets, it provides a regular income for a crew of six.

It can be appreciated that crofts of this size and quality can neither provide the croafter and his family with sufficient income, nor fully occupy the croafter's time. The Highland Survey describes Orinsay as "primarily a fishing township". Today the fishing has ceased to be a major occupation, and only one croafter still does a little inshore fishing, sending his catch direct to Stillingsgate.

There are now 45 people resident in Orinsay but an examination of their ages reveals that less than half of them are between 15 and 64 years. Least there are only six resident males between these ages, and three of these spend at least part of their working away from the township in the Merchant Navy.

As there is neither a school, post office, shopsor garage in Orinsey, there is no available employment in the 'service trades'. Therefore, over half the population between the ages of 15 and 64 are at present in the electrical Board, employed in the Merchant Navy, or working for relatives, while another third are seasonally away with the whelkers. Only one man is employed in the Forestry Commission. These figures, of 1956 and 1957, indicate that they have already investigated many of the possibilities for development. Only one croafter is employed in croafting, but he could be employed for much more than croafting, in fact, he is employed in the Merchant Navy and consequently, the Crofting Area as a whole can be

The district of Park is one of the more isolated and difficult crafting environments. The ruggedness of the terrain, the poor communications, the lack of employment opportunities and the consequent absence of a nucleus of business communities prevention. In addition, many of the crofters have to be prepared to accept the existence of human communities. The population of the Crofting Area of Lamrowey, and the original small settlements grew rapidly as a result of changes in land use which was a natural trend - the conversion of the clearer areas in Park in the form of the creation of a large body of small farmers in favour of an extension of the grazing area. Thus the present conditions are a legacy of the relatively recent past, and of legislation, particularly in the Crofters' Act of 1886, which accepted, and partly agreed to the maintenance of a larger population than the land could reasonably carry[1]. Two World Wars and fluctuating economic factors have had repercussions in Park and resulted in a change in economic and social values, and depopulation has resulted: the 1951 population was 60 per cent of the 1911 total.

1. The Commissioners proposed that only holdings rented at £6 and over should have security of tenure, with a view to discouraging the perpetuation of grossly uneconomic holdings: in the Act, all holdings were given security of tenure.

[Orinsay]

The future existence of the common pasture and croafting is being seriously endangered by encroachment, by bracken and scrub, and by the sheep. The actual sheep stock exceeds the room by 300 per cent. Peat-cutting is gradually destroying valuable grazing areas; in the last three years there has even been some peat cutting on the better grazing land on the island. The dangers both of overstocking and of indiscriminate peat cutting cannot be overstressed.

No statistics are available to show the extent of the decline in the quality of the common pasture. The establishment of shelter belts would provide not only shelter but a means of stopping the peat from 'slumping' down slopes if they were carefully sited. Much of the common pasture could be improved by both drainage scheme and by re-seeding, after sanding and liming, a project well within the capacity of the resident labour force.

Good crops on a few of the croafts suggest that the land is not inherently sterile, however, and it would seem that if the holdings were reduced to a maximum of four, an economic existence might be feasible on these croafts. The steep nature of the soil limits the possibilities of tractor cultivation, but with an improvement in drainage, one might be used in the two valleys.

No pigs or horses are to be found in the township and each croafter keeps very few hens, normally only a few dozen. Egg production is not a major occupation. Any surplus eggs which do not lay are sold on the Co-operative van, but prices are so low that the keeping of more than a dozen hens is far from profitable.

It can be appreciated that crofts of this size and quality can neither provide the croafter and his family with sufficient income, nor fully occupy the croafter's time. The Highland Survey describes Orinsay as "primarily a fishing township". Today the fishing has ceased to be a major occupation, and only one croafter still does a little inshore fishing, sending his catch direct to Billingsgate.

SUMMARY AND CONCLUSIONS

The aim of the Glasgow University Department of Geography Croafting Survey is to record and interpret all material relevant to the croafting districts, and in so doing provide a clear and impartial statement of the problems of croafting. The Survey has been concerned with the Island of Park, the Parish Association hoped that a body of fact would be assembled and conclusions drawn which would assist the croafter in his struggle to maintain and develop the well-being of the crofts. These two Preliminary Reports, of 1956 and 1957, indicate that they have already investigated many of the possibilities for development. Only one croafter is employed in croafting, but he could be employed for much more than croafting, in fact, he is employed in the Merchant Navy and consequently, the Crofting Area as a whole can be

As far as the land is concerned, the survey leaves no doubt that improvements in husbandry and pastures are definitely possible. Yet, until viable agricultural units have been created, there is little incentive for large scale improvement in either sphere. It is an esoteric opinion that no croafter working on a croft in Park which would bring in £300 a year would have time to engage in ancillary work and at the same time fully work his holding in accordance with the rules of good husbandry. If this opinion is accepted, and it is also accepted that such crofts are desirable and the present crofters are the only agricultural township where there is a higher proportion of full-time crofters than elsewhere would bear the out, it follows that ancillary employment on such units would have to be found on

1. Park Association Annual Report, 1956.

finally scrapped for ammunition. Drying sheds have been erected at Staffin. Power machinery for extraction has been brought in; a processing plant has been built at Uig with German equipment; and experienced men have been employed.

The industry is admirably suited to the island. The great weight-losing properties of the raw material, the scarcity value of good deposits, and the large commercial demand combine to offset the high cost of transportation from which most export prices suffer. It is estimated by the directors of the company, an English concern, at least that fifty men will eventually be employed in the pit and at the plant. They will be given regular employment, five days a week in three shifts. In addition to building the access road the government, through the Department of Agriculture, has leased the site, and the Inverness County Council has erected subsidized housing at Uig to encourage the venture. When the Secretary of State Presided at the opening of the plant in May, 1954, he spoke of the promise the industry held for the island's future, especially the prospect of regular employment. Up to June, 1954, however, the employment was irregular and limited to sixteen men.

The Skye Tweed Industry. About twenty-five years ago a small weaving and basketry shop was established at Duntulm in Kilmuir. The factor for the Department of Agriculture acted as manager, and the local Church of Scotland minister was the foreman. Later it was taken over by the Highland Home Industries, a cooperative, non-profit corporation.

Highland Home Industries is the result of a union in 1914 of two similar movements begun fifty or sixty years ago by several beneficent women to help the croafters find a market for salable manufactures and reduce their need for dependance on the often exploitive barter system.[1] The Skye workshop has employed eight to ten men and women over the years, plus some who worked at home, but it has never been economic. In 1954 the director, a woman from Edinburgh, was unable to buy material and pay the wages of the four remaining weavers. The old market has disappeared. The shop was unsuccessfully offered for sale in February. Fortunately, a gift from an undisclosed source averted the necessity of closing down.

Only the very old people in Skye can remember when weaving was a household industry. Until the Harris people were settled on Skye at Portnanlong, it must have been a lost art. Today even the Harris folk have given up weaving. They say the purchase tax on luxury, mass woven woolens has destroyed their market. The hand shuttles on one or two looms which are used only move for special orders. The Portree woolen mill, originally established by the Highland Destitution Fund in 1891 and now owned by an east coast corporation, still operates on a limited production schedule. About a dozen village residents are employed regularly, and a few "tinker" girls, daughters of the wandering Highland tinsmiths, find work at the looms.

[1] Alexander Maclehose, The Scotland of Our Sons (London: Alexander Maclehose and Co., 1937), pp. 292-294.

233 Little close attention is paid to shepherding though several crofters profess to liking it. The great losses on the moor (often amounting to one third of the lambs each year) does not seem to cause much worry. The chief income from the sheep is the fleece which sells at up to 4/- per pound, an average fleece weighing from three to four pounds. This wool is not used for the tweed industry since it is too coarse being more suited to carpet manufacture. Appendix C (6) shows that the majority of flocks are small averaging from 10-20. The overgrazing is the result of a smaller number of owners keeping larger flocks. Thirteen of the working units have between 50 and 100 sheep. As to those without sheep, several crofters declared themselves to be too old to bother with them, a fact which serves as an illustration and introduction to the population problems.

Appendices D (1) shows the twofold nature of the difficulties which confront the community. Twenty-two per cent of the residents are over 65 years of age and no less than 56% are over 45 years old. With the sole exception of one man who works on the power development project at Gisla in South Uig, the main focus of employment is local. A small number of people are engaged in services to the community including shopkeeping, but the main source of income is weaving since crofting itself (by definition in this area at least) does not yield sufficient to maintain a family. Yet there are 31 full time crofters who are being supported in some other way, either by relations temporarily or permanently absent or by interest on capital accumulated during periods of employment away from the island.

There is an insufficiency of women of child-bearing age to offer hope of an increase in the population or even a sufficient number to guarantee a level of replacement. This fact toegther with the emphasis on one form of employment gives rise to anxiety among the crofters, who recollect what happened when the fishing finally collapsed during the First World War after a period of steady decline. In 1913 twenty boats sailed from Carloway and gave employment to 295 men. If the weaving fails (at present a weaver making three tweeds per week can earn up to £16 for them) there will be similar hardship and the net emigration from an area already none too attractive to young people will certainly become more marked than it is at present.

Table 36

Fishing in the Carloway District 1892-1956

	Numbers engaged		
	Boats	Men	Value of catch:
1892	65	300	?
1900	27	318	?
1913	20	295	£8,700
1920	14	266	£560
1930	10	83	£262
1938	10	40	£470
1948	14	40	£174
1956	15	18	nil

Note: Boats returned may not have been in regular use; many of the men were mainly engaged as hands on east coast boats.

that the movement of whole families is unusual, although a few have migrated to Stornoway, particularly from the south. In this respect Uig, except to some extent the south, differs from Park; only 15% of emigrants have gone to Stornoway, c.f. 32% from Park.

TABLE 51

The Destination of Emigrants, 1939 - 1959

Destination	Males (No.)	Females (No.)	(1)	Total (No.)	(%)	c.f. Park (%)

All destinations	236	291	(206)	527	(100)	(100)

Notes: (1) The figure in parenthesis under 'females' indicates those who became 'migrants' on marriage.

Male emigrants from Uig go mainly to Glasgow and other parts of the mainland (table 51). Since 1939 (in effect since 1945) only 12% have gone overseas; 16% have moved to Stornoway and a further 10% to other parts of Lewis. This is almost entirely a movement in search of work. Female emigrants from the parish are less widely dispersed: more went to other parts of Lewis and fewer overseas. There is a special factor in the case of female emigrants. Social intercourse between the different island districts is very active, despite the apparent lack of facilities; almost a third of the female emigrants from Uig became migrants on marriage into other Lewis parishes. Even if we discount such migration, more women than men migrated from Uig between 1939 and 1959. Weaving retains young men but not the young women.

Migration from a crofting district is a somewhat indeterminate process. Young people of both sexes go to Glasgow or elsewhere in search of work. For a while they maintain their island homes but, eventually, they set up homes of their own. Our criterion of 'migration', as against (working permanently away', was this setting up of a home. Thus the critical point is often marriage and it will be noted (table 51 and Appendices B(3) and D(3) that a very large proportion of female emigrants appear to have emigrated on marriage; in the case of migration outwith Lewis this usually means that for some time previous to their becoming 'emigrants' they had seasonal or permanent employment away from home. Indeed, our enquiries showed that the great majority of young women who took employment on the mainland eventually married and settled away from Lewis. Only a small minority returned, often giving up their employment in order to care for ageing relatives. An island man may occasionally return with a mainland wife but cases of island girls bringing mainland men to settle in the island are rare indeed.

TABLE 55

Proportion of resident males, aged 15-64, in Major categories of employment

See Appendices B(2) and D(2) for details.

	Croft-work only	Croft-work and weaving	Croft and other regular work	Croft and periodic work	No croft work	Total (100%)
Uig Parish	11	43	16	15	14	(635)
Districts						
South Uig	13	27	22	24	13	(188)
Bernera	8	36	25	19	12	(130)
East Loch Roag	9	50	11	11	19	(146)
Carloway	16	61	6	6	13	(171)

Table 55 and figure 47 summarise the main sources of employment. The small group engaged in 'croft-work only' may be briefly dismissed. A large proportion of these men are elderly or otherwise infirm; a few are pensioners (e.g. retired police or service men); very few indeed are fully occupied in the agricultural work of their crofts, thus 'full-time crofters' is a misnomer in this area.

The most important category, in all districts, is 'croft-work and weaving', but it is relatively far less important in the south where there is correspondingly greater reliance on other forms of regular employment or on periodic work, i.e. casual labour.* It is difficult to overestimate the significance of weaving in all districts. It is the only substantial source of income in the parish and it should be clear from the previous chapter that weaving is not an ancillary occupation to croft work except in a few cases in the south. The weavers are not 'crofter-weavers' so much as 'weaver-crofters'. A curious distinction between Carloway and the rest of the parish is that, whereas generally weaving is young mens' work, the great majority being under 45, in the Carloway area two-thirds of the weavers are over 45. The historical reason for this may be the earlier spread of weaving into Carloway than elsewhere for, although some weaving has always been done throughout the area, it only became a major source of employment south of Carloway in the last 20 years or so. Thus few of the older men in the south learned weaving when they were young. A corollary is greater dependance on the Merchant Navy as a source of employment for young men from Carloway than for those from the south.

Other sources of regular local employment are lobster fishing (Bernera only), gamekeeping and other estate work (Bernera shore and South Uig), and government establishments (South Uig). In addition there are the usual services - postmen, haulage contractors,

* For a detailed discussion of the significance of weaving see Moisley, H.A., Harris Tweed - a growing Highland industry. Economic Geography, 37, 1961, pages 353 - 370.

[TEXT CONTINUED ON PAGE 152]

464 shopkeepers and so on. But none vies with weaving as a source of regular income. Without the weavers most of the others would find little demand for their wares or services.

Periodic work is taken locally, usually in default of regular employment, and often by older men who formerly worked away from home. This is usually casual labour and is particularly important - for lack of other opportunities - in South Uig. Whilst our survey was in progress a number of men from South Uig were thus engaged at the Gisla hydro-electric scheme. In South Uig, also, weaving tends to be less regular than elsewhere. For this some weavers blamed the Stornoway producers, who, it was claimed are not inclined to send work as far out as this unless it cannot otherwise be done. There is some truth in this, particularly with respect to the 'small' (i.e. non-mill) producers, but our observations also showed that some men in South Uig regarded weaving as an 'extra' and were not prepared to do it when alternative employment, on the croft or for wages (as at Gisla), was offered. This may be a vicious spiral - the less weaving a man does the less good he becomes, he takes longer to complete a web and may suffer more deductions for faulty work. He becomes less inclined to weave and the producer becomes less inclined to send him work.

* including five working seasonally on whalers.

Those taking permanent employment away from home (table 56) tend to choose particular occupations. Amongst men, the Merchant Navy is most popular, especially from the Carloway and East Loch Roag districts; many of the others work at skilled or semi-skilled jobs, including the police forces; relatively few are un-skilled casual labourers. Amongst women, nursing is by far the most important occupation and is particularly popular amongst young women from South Uig and Bernera; most of ther others take 'domestic work' - in hotels and hospitals, rather than in private homes - and a few work in offices and shops. The category 'professions' in the table is almost synonymous with school-teaching.

Periodical, including seasonal, absence from home is less common than from some island districts; 14% of the 15-64 age-group is classified as "periodically away" (compare 27% from Park, 16% from Harris, 13% from Barra). Of these, half the men and a third of the women are students. Seasonal hotel work, for women, is the most important single category.

Population trends

162 The diagrams, figure 48, summarise much of this chapter. They have been constructed so that the area of each horizontal bar is proportionate to the number of persons in the

000 1) Further depopulation is inevitable but is not necessarily bad. The special privileges of crofting tenure have tended to delay the inevitable because the agricultural structure has been unable to adapt itself to changing circumstances. The land is in some ways less productive than it was 80 years ago. But, as population does decline, eventually more land ought to be available for each remaining family and, if properly used, should enable them to increase the proportion of their incomes derived from agriculture. Thus depopulation could have beneficial effects provided it were not haphazard nor complete. The rate and ultimate extent of depopulation could be controlled to some extent if a realistic assessment of the possibilities of each district were made, followed by a vigourous attempt to realise these possibilities. This must be done locally because the problems and possibilities of each district, sometimes of each township, are different. How can this be done?

288 2) It is not realistic to plan for any extensive development of industry nor for any substantial further development of forestry or fishing. Lewis is suitable for the development of industry - the phenomenal growth of the Harris Tweed industry, with an annual output worth £5 million, much of it for export, is proof enough of that. But when it is difficult to get industrialists to invest in lowland Scotland there is little point in living in perpetual hope in Lewis. To constantly cry, as some politicians do, that 'the government should send industry to Lewis', is not helpful, either, for no government has ever had sufficient power, nor is it desirable that it should have, to force a firm to invest against its will. If there is to be some industrial development it must come willingly; it would be unwise to depend on it. It follows, therefore, that agriculture must be made a more efficient basis, though not the sole basis, of most crofting communities. The present heavy dependence on casual or seasonal employment, and on permanent employment away from home, can never provide the bases for a truly viable community though it may provide a useful outlet for some younger folk. On its present scale it leads to the neglect of the only widespread natural resource, the land, as well as encouraging permanent emigration.

311 433 3) Crofting agriculture, as at present carried on, on most crofts, does not make the best use of the local resources. The land is marginal in many respects and the development of an economic form of agriculture requires:

(a) particular skill in farm management, including initiative and technical ability to take advantage of new materials and methods, and
(b) a marketing system on which the crofter believes he can depend. At present it is the uncertainty, as much as the poverty, of the reward that deters young men from taking up agriculture seriously.

427 4) The small size of holdings need not be a serious disadvantage. Since the time of our survey subletting is no longer necessarily contrary to the conditions of crofting tenure; since it represents a voluntary evolution towards larger holdings it, rather than wholesale reorganisation, should be further encouraged.

5) It should be recognised that if a croft is not properly stocked it cannot justifiably be the subject of any of the privileges of crofting tenure. Failure to maintain a properly balanced stock is damaging to the land and to the ultimate well-being of the community as a whole. At one time the factors, through their ground officers, maintained a degree of control over the stocking of township lands and this could, in some way, be resumed - if not by the proprietors then by the Crofters Commission, - though the best way would be voluntarily, through the township committees. This would depend on establishing soumings which fairly represented the grazing capacity of the township lands; and on restricting the unlimited substitution of sheep for cattle. At present many soumings depend on restatements of old ones the validity of which is very dubious; soumings are unlikely to be respected unless they are reasonable.

181 6) Few crofters possess sufficient technical knowledge and confidence to make the best use of their land. It is particularly difficult for men with such limited resources of land and ready cash to embark on new agricultural enterprises; they are naturally reluctant to take risks and therefore tend to be excessively conservative. This cannot be put right quickly nor so long as the majority of those working the crofts are middle aged or older men who have spent the greater part of their working lives in other occupations. Such men require special help but, above all, some of the younger men must be encouraged to

166 However, not all such
167 employment is available in Park: 47 percent of the insurable male population
464 leave the Hebrides to find employment; one third take seasonal employment, and two-thirds permanent employment furth of Park (See Table VIII).

Employment within Park

288 Table IX shows that opportunities for local employment are strictly limited. Weaving of
466 Harris tweed is the most important single source of employment. It is significant that those engaging in it are almost all crofters working in their abundant spare time. Weaving is an ideal adjunct to croft work as it is unaffected by weather or hours of daylight and thus can be performed during periods of agricultural inactivity. The vagaries of the Harris tweed market make the occupation precarious; Park is one of the more inaccessible areas of Lewis and the mills are apt to give their commissions to the weavers nearer at hand around Stornoway when
[178] work is scarce. Since 1952, the number of weavers in the fishing townships of Cromore, Marivig, Calbost and Gravir has grown from 11 to 22 and much of the credit for this is due to
[228] the activities of the Pairc Association. Fishing, on the other hand, has lost ground in the same period: the number of fishermen has declined in these townships from 20 to 14[1]. Apart from
463 weaving, service occupations form the only other employment available, shop-keeping, driving
464 and road maintenance being the chief occupations in the service group. There are very few craftsmen: with such a small population, and the long established tradition that the crofter builds his house and is his own tradesman, there is little opportunity for a trained builder, joiner or even shoemaker to make a livelihood. The professional class is small and entirely composed of the minister and missionaries, the doctor and several schoolmasters.

[462] There is little opportunity for women to find employment in Park, apart from nursing, shop-keeping and school teaching, and a few domestic service posts (See Table IX).

Employment furth of Park

166 The persons in the 15-44 age group form the main body of those working away from home.
167 The distinction made between 'seasonally away' and 'regularly away' is that the former group
462 spend part of the year elsewhere, the men on whalers in South Georgia or with the Tay Salmon
463 Fisheries at Perth, or labouring on the mainland. The women are in domestic service, mainly
464 in hotels. A majority of the men in the latter category are in the Merchant Navy; in some cases these men take leave to coincide with the spring work and the harvest. The majority of the women are in domestic service (See Tables IX and XI).

An interesting comparison in the 'regularly away' group exists between men and women in the professional classes (Tables IX and XI). The sample is small, but it is clear that more women than men attain professional status. The number of domestic servants, nurses, and merchant seamen is a reminder that the crofting districts provide a pool of labour for certain vital occupations, some none too popular in Britain as a whole. In people alone, one can say that Park makes a distinct contribution to the fabric of the national economy and this contribution is much more apparent outside Park than within the district. At the same time a majority of those who are temporarily or permanently away eventually marry and settle outside the district and thus a most valuable section of the community is constantly moving southwards. Only 35 per cent of the men in the 15-44 age group are wholly resident in Park, and 46 per cent of the women in the same age group, a reflection of the poor prospects and utter inadequacy of resources on the most of the crofts.

1 The 1952 figures are abstracted from the Lewis Survey Report on part of South Lochs.

178
• 291 The dress of the people has changed. The men commonly wear overalls instead of the fisherman's blue jersey. Till 1919 every woman and girl wore the black petticoat striped with colours, dark blouse, often with stays, and a knitted muffler round her neck and over her head. In summer the tartan shawl was more typical of Sundays than week days (Plate IX). In clothing, a change for the worse preceded a change for the better. The abandonment of homespun, rich in wet-resisting oil, for machine-made cloth was at first a loss; but oilskins, waterproofs, and rubber boots are a surer protection to all on land or sea. For much of the year the women went barefoot but for the *osanan*, worn except in warm weather; these are stockings leaving the sole bare and kept over the foot by a band passing under the middle toes. In a wet climate with much soft ground this was a sensible custom, for wet feet, easily washed, were warm and dry as soon as the women came indoors. They moved hardily, yet a little warily, for fear of stones and, when not fatigued, with a short, springing step which was a pleasure to watch. At the same time their feet were sorely tried by rough heather or stony ground, especially when they were carrying a laden creel. Now nearly all except elderly women wear shoes (or rubbers) and stockings. They have given up the dark, striped full skirt and petticoat worn till 1919 and adopted the skirt and blouse or jumper of the towns, or the short frock so much simplified since Edwardian times. In fine weather the head is bare, though often netted because of the wind.

[369] As dress changes, it is often said that the country copies the town; the reverse were truer, in essentials. By 1914 the townswoman had begun to copy her sister in the country, seeking for common sense and simplicity; and what is true of dress may be true of other things.

178 262 Most of the outward changes which have occurred in the island took place in the two decades just after the first world war. Food, for instance, now tends to be better balanced and contains more nutrients. Staple diets in the past were mostly confined to a few items, and based on the potato. Fish, particularly those with essential oils (eg cod) were, of course, available; but only if the fishermen were lucky in the catch. As for vegetables and fresh fruit, it was not until after the 1920s that these became generally available all the year round.

178 291 Another outward change has been in dress. Until the beginning of the twenties, the women wore a black petticoat striped with colours, a dark blouse, often with stays, and a knitted muffler round the neck and over the head. In summer, the tartan shawl was more typical of Sunday-wear than of weekdays. Men's clothes tended to be of the homespun type, rich in water-resisting oil. Later these were replaced, so far as the fishermen were concerned, with oilskins, waterproofs and rubber boots. Dress nowadays of course tends to conform to what is displayed in magazines, on the film screen and on television.

178 181 The changes in the mental characteristics of a people are not so obvious. Centuries of generations of long-dead forbears have contributed their accretions to the character of the island people today. It is a complex one. Impressions of the island people as such are few, mainly because observers looked for those economic aspects which gave the society its *raison d'être*. That islandfolk of 175 181 former times were fond of music and dancing was the observation of the Rev John Lane Buchanan, who was 'Missionary Minister to the Isles from the Church of Scotland' from 1782 to 1790. In a volume published in 1793, in which he describes his Hebridean experiences, he says that the British laws had been introduced to the Island of Lewis by the Seaforth of that period. [535] The Lewis people, he says, 'since their late happy change from servitude to freedom, by the present noble-minded proprietor, are animated with such life as to meet in companies, regularly each week, at stated places, where both old and young take their turn in this agreeable past-time [dancing], when they exercise themselves with amazing alertness and spirit.' Martin Martin mentions that in his time (*c* 1695) the Lewis people were 'very dextrous in the exercises of swimming, archery, vaulting, or leaping'.

175* 181 in the exercises of swimming, archery, vaulting, or leaping'. He also says that they were great lovers of music, and that when he was in the island he heard of eighteen men who could play the [533] [534] violin well without having been taught.

The Rev William MacRae, minister of Barvas, writing in the *New Statistical Account*, gives a description of his parishioners (in 1836) which can be applied to all the country districts in the island at that time. After stating that in their habits much clean- [515] liness can scarcely be expected, considering their poverty and the wretchedness of their habitations, he says:

> Their mode of living most closely approaches the pastoral: without arts, trade, manufacture, navigation, or literature, their whole round of duty consists in securing fuel, in sowing and reaping their scanty crops, and in rearing their flocks, and tending them at pasture. Yet in these limited circumstances, while supplied with food and clothing of the plainest description, and able to pay their rents, their simple cottages are abodes of happiness and contentment. Blue kelt [a thick cloth] is almost the only dress [291] worn by the men, and stuffs, variously striped, by the women, with under dresses of plaiding, all home-made. In many instances, however, cotton shirts and print gowns are beginning to supersede the use of some of these articles . . . Their ordinary food con- [262] sists of oat and barley meal, potatoes and milk variously prepared. Their domestic economy is frugal and moderate beyond conception. The produce of a foreign soil such as tea, coffee, and sugar, and the common conveniences of art, such as knives, forks, and etc., are to them altogether alien.

It is of interest that the change in dress-types (from woollen [164] homespuns to cotton fabrics) was followed by an increase in the incidence of rheumatism.

Today, the island folk are reputed to be gloomy with a black, 181 depressive attitude towards life. The editor of the *Stornoway Gazette* has pointed out: 'We cannot understand a people and why they act as they do unless we know the content of their memories. We cannot understand the paradox of the naturally gay in heart seeking religious consolation in a grim and gritty Calvinism. We cannot understand why Lewis, which clothes the world in colourful tweeds, clothes most of the women in noth-

286 Make smooth and even the warp of my loom
788 And grant thy blessing, God, on me,
On all who here find shelter and room
539 And dwelling . . .

Thine arm be round each woman here
Who waulks this web of mine,
O aid her in her hour of need . . .

Keep the flock that we may win
Sweet and nourishing milk to drink
And wool to give, to weans and kin,
For wear!

Even now in Harris or the Lews, a brief good wish may be uttered—a "Health and strength to the wearers!" as the perspiring women end the waulking; but in the past the web was finally consecrated. Each of the family who was to wear a portion of it was named by the weaver herself, who led the consecration (*Carmina*, No. 113).

May the well-loved wearer of my web
Never be wounded . . .
May the sanctuary shield of the Lord be his. . . .

286 The significance of this gift of hard-won cloth can now
532 be seen, first for the family but next for the neighbourly
614 team. We can understand how each 'set' or pattern of
[593] tartan stood for the spirit of the family and the group of
[621] kin and homeland, the clan. We conceive what it meant
to the Gael when the tartan, with "the Highland dress
. . . or any part of it whatsoever", was forbidden "to
• [291] any man or boy" in the Highlands. Women were still
allowed to wear it, it was true, but the dress ceased to be
a symbol of community when its wear was confined to
[714] one sex. As a single exception, the Highland dress was
[175] retained for soldiers, but the militarisation of the tartan—
though it seized upon one strand of clanship, that of

286
532 warfare—destroyed its intimate tie with the home, with
614 peace. The web the women had dyed, spun, woven and
714 waulked together ceased to be a sacrament when the tartan
[178] was proscribed to men except when worn as a uniform with
"England's cruel red".
[648] The framers of this law, which stood on the statute
book for over forty years, took full cognisance of what they
175 did. Appended to the Act of 1747 was an oath which
648 reversed every benediction said by the women at their
work: "I . . . do swear, as I shall answer to God at
286 the great day of judgment, I have not, nor shall have, any
• 291 gun, sword, pistol or arm whatever, and never use tartan,
782 plaid or any part of the Highland garb; and if I do,
641 may I be cursed in my undertaking, family and property—
may I never see my wife and children, father, mother,
relations—may I be killed in battle as a coward and be
without Christian burial in a strange land, far from the
graves of my forebears and kindred; may this come across
me if I break my oath". This Act, as law and symbol,
struck full at the sacramental life of family, neighbour-team
and clan community, in which labour and prayer had been
indissolubly bound.[1]

(c) WORSHIP, CONGREGATIONAL AND PERSONAL: THE BOOK AND THE WORD

178 Little remains of the tradition of worship in the tiny
771 oratories, chapels or 'temples' whose ruins stud the shores

[1] The collaboration of friends in Lewis may allow mention of the Gaelic
346 version of A. Geddes, *The Spirit of the Tartan, a Song Drama* (English
172 Version); *Souvenir Programme and Book of Songs* (Outlook Tower, Edin-
burgh, 1932). In this the spirit of this labour sequence embodied in its
[113] songs and runes is dramatised in its setting of custom and history. The Gaelic
version was prepared by the generous labours of James Thomson, M.A.,
Bayble, and the late Duncan Macdonald, M.A., Sandwick, Lewis.

796 given at Christmas; in Lewis, Christmas is identified
431 with Catholicism, and is an insignificant event in
184 comparison with New Year. To give two examples, a New
527 Year's dance is given, but not a Christmas dance; and
796 the mills continue working on Christmas if it occurs
184 on a week day, but close for at least two days at New Year's. In Shawbost, bannag is defined as a party associated with Hogmanay (New Year's eve).

527 In the recent past, until about ten years ago,
• 292 the boys dressed in women's clothes or wore masks. They
178 took turns wearing a cow's skin as they went from house to house. In each house, the boy wearing the skin was
[539] hit by the others as he chanted the rann na bannag (rhyme of the bannag):

Here I come again renewing Christmas.
(Or, in another version: This is the New Year's night.)
I'll take the bread without the butter,
And the butter without the bread,
And the cheese by itself.
Then we won't be empty-handed.
One thing I refuse is a mangy potato.
It gives a heavy feeling.
It's not healthy.
If you don't give me my bit of butter and my lump of cheese,
Everything you possess will be gotten by the crows on St. Patrick's Day.

527 As the balaich na bannagan left the house in which
431 they had received gifts, they blessed it. All food and
178 money was given to the woman who prepared the bannag.
[788] Today children tend to receive money more often than food, and use some of the money to buy sweets at the post

781 conversions that take place in other villages. "Five
571 persons converted recently in Lochs. Two used to drink a lot, they're saying." Sometimes mass conversions occu
[786] called "revivals," during which people shout, chant, speak in tongues, and sometimes collapse.

794 Although strict observance of religious practices
829 must be maintained by the converted while they are on th island, it is possible for them to relax this observance when they visit mainland cities. The converted see noth wrong with attending plays or movies in Glasgow, as long as no one observes them. A non-believer once commented wrly, "They believe in the 11th commandment: thou shall not be seen." Women who have spent many years in domest service on the mainland, where they generally live very different sorts of lives from those of island people, of return to the island to retire. They then take up the
• [292] color of their surroundings. The long black dress then becomes the appropriate garb for them on Sundays. As on person observed, "Women deposit their curam in the Left Luggage Department at Stornoway, and pick it up fifty ye later."

779 The beliefs of the Free Church include explanations for all events. "Everything of importance that happened in history is recorded in the Bible." Predestination li behind all unexpected events; a sense of fatalism dulls

PLATE VIB. AN OLD CROFTER OF EOROPIE, BUTT OF LEWIS

Racially, a broadhead

Hundreds
103 of place names are known to the villagers
which are not marked on any map. These place names
[193] constitute part of the oral tradition of a population
which has lived in a confined geographical area for
generations.

632 In most of Lewis, village and township coincide.
621 The village of Shawbost is composed of two townships,
● 311 South Shawbost in which the crofts splay outward like
423 a fan from roads which curve over an uneven landscape,
[363] and North Shawbost which is composed of linear streets
(see Map C), to which the crofts are perpendicular.
Each township has its own common grazing land, and its
own grazing committee. All of South Shawbost and part
of North Shawbost belong to one private estate (which
includes other townships to the southwest), and most
of North Shawbost belongs to an estate which extends to
Barvas. Beyond the fact that non-crofters in South
Shawbost have found it easier to acquire crofting status,
little difference between the two townships appears to
be due to their belonging to different estates. As
[427] elsewhere in crofting regions, the landlords of the
[529] two estates are concerned mainly with the sporting
potential of their land.

632 The two townships are themselves divided into named
neighborhoods (cf. Vallee 1955 for a discussion of
"natural neighborhoods" in crofting areas).

311 There are 144 crofts in the village (nine of
241 which, in South Shawbost, were added after the turn of
[175] the century by non-crofters encamped on common grazing
[427] land who applied to the landlord for crofter status).
Thirty-four (almost a quarter) of these crofts are
vacant; that is, the holders of the crofts live else-
[527] where. One of the vacant crofts is used by its absentee
[493] tenant for holidays, and one sports a trailer (called
[485] a "caravan" in Britain) which may be rented to tourists
during the summer. The rest are cultivated or used for
[428] grazing by crofters or non-crofters in the village who
[427] by inheritance or by formal or informal subletting have
gained use of the land.

241 A little over half of the crofts are worked as
individual units; 44% of the crofts are worked as
combined units of two and three. Twenty-four men have
the use of two crofts each, and five men the use of three
crofts each.

16 A feature of crofting townships usually emphasized
is their disproportionately large number of aged people
and small number of young people, who tend to migrate
to the cities. An age-sex "population pyramid" of the
Highlands is not a pyramid but a top-heavy hourglass
(see Table I).1 Most persons of child-bearing age have
migrated from the area and the number of children is
1. [See p.vii--Analyst]

And so, after every good wish for days, years and life, the Invocation closes: "Peter has come and Paul" . . . the Disciples and the Archangels. . . . Jesus the mild and the Spirit of guidance have come,

> And the King of kings has come on the helm,
> To bestow on thee their affection and their love,
> *A bhaireadh duit-se graidh us ruin.*

The ideal of choice maidenliness which this Invocation portrays, culminates in the thought of the loveliness that was Christ. It rises, too, to stirring virility: "the island at sea, the fortress on land", or "the step of the steed on the plain". Yet when all is said, it is a womanly image which prevails: after the fortress comes the well in the desert, and after the charger's step, the gracious calm of a floating swan. It is all the more significant that the Invocation was addressed both 'to boys and girls' in one isle, and 'to youths and maidens' in another. Not simply was boyhood taught to honour girlhood: ideal womanhood was invoked to raise manhood itself to fullness.

Upon marriage, the husband replaced the maiden's snood or *stiom* that bound her uncovered hair by the wifely kerchief, *am breid*. Folded diagonally, its three-cornered shape came to symbolise the Trinity, in benediction on the bride's head.[1] A poem to a bride, "now beginning her dual course", commences, "A thousand hails to thee

likeness. The short second stanza given stands out alone: the poem, having attained its climax by a rhythm sustaining the upward, sonorous movement, is hushed by its few simple words. In *From the Hebrides*, Mrs. Kennedy-Fraser rearranged one or two of these lovely stanzas, as one of her 'lyrics with refrain'. *Cf.* A. Geddes, *The Songs of Craig and Ben*, vol. ii, 1955.

[1] The kertch is spoken of in many songs, in which a lover hopes to place it on his young love's head, or a husband praises its whiteness as worn by his wife. When first I knew the Lews, the kertch was still commonly worn under the more recent Lowland mutch, and either framed a young face, or an old one, charmingly. The two have not quite vanished, though memories of what the kertch once symbolised are hard to find.

THE OTHER ISLANDS

even to the extent that the St Kildans used their observations of the flights of birds both as compass and as omen for good or evil. Martin speaks of the islands with amusement and admiration. He indicates that the community was backward in some ways: they were illiterate, and wondered naïvely at the newcomers and their manners. 'The inhabitants of St Kilda are much happier than the generality of mankind, as being the almost only people in the world who feel the sweetness of true liberty.'

In May 1877, when the local tourist trade had hardly started, HMS *Flirt* sailed from Greenock with food to relieve hardship among the St Kildans, and an officer of the Highland & Island Agricultural Society on board reported that 'Tobacco was what they invariably asked for'. The ordinary diet of the island consisted of, for breakfast, porridge and milk; for dinner, potatoes and the flesh of fulmar, or mutton and, occasionally, fish; for supper, porridge when meal was plentiful. Seabirds' eggs, from March onwards, also formed a staple food. Tea was taken once or twice a week and the islanders were reported to be 'rather fond of it'. There were eighteen inhabited houses, sixteen of which had zinc roofs, two being thatched huts. The sixteen new cottages had been erected about 1863, 'and are certainly much superior to the inhabitations of the same class of tenants anywhere in the Western Isles'. All were well furnished, peat was used for fuel and there were two watches and one clock on the island. There were some seventy-five islanders; most of the men were old, and only two of them were unmarried, with twelve spinsters still to choose from. All read the Gaelic Bible. The men were mostly tailors, shoemakers and weavers; every house had a loom. They made all their own clothing, the men also making the women's dresses, and a good deal of blanketing and tweed cloth was made and sold. Nearly every house had a spinning wheel and a large pot in which the yarn was dyed. The women were expert knitters. Each croft and house was rented at £2 annually, sheep being charged for at the rate of 9d per head; these charges were usually paid in kind.

Feathers of the sea fowl formed the principal export of the island. The factor paid 6s per stone of 24 lb for black feathers; and 5s per stone for grey. For these he received, in Edinburgh or

781 794 [302] meetings. If a woman converts when she is off the island, as occasionally happens during the first year or so at university or other school, the tell-tale sign is that she begins to let her hair grow, and wears it tied back in a bun.

The word curam means "conversion," but is also used in ordinary conversation to mean being careful, such as keeping one's clothes tidy. It also means to be circumspect. In a religious context, it means to be careful of one's behavior, as this behavior reflects on the state of one's soul. When a person "has the curam," he has demonstrated that he is "in a state of conviction," that he has undergone conversion. People say, "A change has come into my life." The "change" includes the cessation of drinking and going to dances and concerts. Woman stop smoking. "After you are converted, you don't watch TV on Sunday. You should do everything for Sunday on Saturday, like shine your shoes for church or cook the Sunday dinner."

781 794 795

781 273 A dramatic change in behavior is often found among men who have had a history of hard drinking. One man went into the bothan, raised a glass to his lips, but never drank. "He put it down and walked out. They put the glass of whiskey aside, expecting him to return. He was a hard-working man, one of the hardest workers in the village, but everything went to booze in the bothan. He slept in

175 632 241 In any case, the "town" or township was not the effective work unit, but rather was the larger neighborhood in which several joint farms existed. [233] The tenants of several joint farms grazed their stock on the surrounding moorland (i.e., on common grazing land).

D. From Run-rig to Crofting

175 233 241 311 Run-rig was an agricultural system suited to a pastoral people, who required the use of open, common pasture for grazing their livestock; the arable land was limited, and of varying quality (according to Day (1918: 12), 54% of the land in crofting counties was mountain and heath used for grazing, and only 5% was [423] arable land). Residents worked several strips of different quality, and the strips (in drained beds of earth a few feet wide and many feet long called lazy-beds or fiannagan) were usually re-allocated every few [625] years. A "constable" acting for the landlord ensured that proper husbandry was maintained.

175 241 178 427 The joint farm, and the stratification of tenants and subtenants within the farm, disappeared as "progressive" landlords began, in the second half of the 18th century, to substitute compact holdings for the "mingle-mangle of dispersed strips (Gray 1952: 46)" 000 which characterized run-rig. Hamlets or clachans

175 information via the technology of mass society to

671 For example, young people are able to leave the island
178 and work in British cities or abroad, sending money
[464] home to sustain their aged parents who by law cannot
[457] be removed from the croft.

E. Changing Land Use

311 Darling (1955) described the previous Highland way
175 of life as a well-adapted, ecologically balanced system
182 in which proper use of land was attempted by limiting the number of livestock, preserving a proper ratio between cattle and sheep, and regulating the flow of stock on the land throughout the year. Dikes (fences of turf or stone) and drains were communally repaired
178 and cleaned. Although continuity with the previous way
311 of life is evident today, the overall picture is one of
[182] partial use, and misuse, of natural resources. Various
[654] advisors from government organizations and colleges have been brought in to encourage effective husbandry and land use.

1. Specialization and Individuation: The change from an ecologically adapted, internally regulated community in which land was used intensively for subsi

178 purposes, to a community which, as an agricultural
311 entity, requires transfusions from the larger society, is accompanied by patterns of specialization and individuation. The following table (Table III)[1] of agricultural statistics for the parish of Barvas demonstrates the change, over the past 100 years, from intensive subsistence agriculture to specialized production. From a broad-based subsistence use of the croft (as revealed by the number of acres cultivated for barley, potatoes and oats; and by the number of cattle, especially milk cows), there emerges a tendency
[23] toward specialized production. The number of sheep,
[236] which require less attention than cattle, has increased
[241] since the late 1920's when the weaving of Harris Tweed
[246] commenced in earnest; and around this time there also occurs a differentiation in cultivation, between the production of barley and potatoes (used largely for human consumption) and the production of oats (used largely for
[231] feeding livestock). After 1931 agricultural returns began to distinguish between beef and dairy cattle. During the past ten years the number of beef cattle in the parish of Barvas has increased.

241 An important factor which crofters on Lewis now
654 take into account when making decisions about their

175
166 In the last half of the 19th century, many famil
were "cleared" from the district of Uig and resettled
173 Shawbost. According to a local version of village
625 history, the Constable evicted persons from North
166 Shawbost and resettled them in New Shawbost. "The
people from Uig were fishermen, so they needed to be
the sea. They wouldn't take a croft in New Shawbost
all." According to another version, the crofts once
extended all the way across from Carnan to the loch;
when the Uig people came, the crofts were chopped in
half, and the street called Baile Stigh was created.

175 Whatever effect the Constables had on land use a
625 animal husbandry, they are now referred to as "tyrant
who went mad or committed suicide after the Crofters
of 1886.

175 Cattle and horses were tethered or herded within
311 easy walking distance from the township; sheep could
233 be left on the moor without much surveillance. At a
much earlier time another dike existed out beyond the
[178] township dike. The dikes were used according to prin
[221] found in grazing schemes today: the sheep were kept
out on the moor, beyond the second dike, until midsum
when they were moved in closer to the village. At th
point they were still out of the arable land of the

/facing p. iii/

township, but on land which had been rested and which thus provided better grazing. During the winter the sheep were allowed past the township dike, to graze along with the other livestock on the stubble of corn and barley, and mineral-rich seaweed by the shore.

After World War II, the individual crofts began to be fenced, and the township dike was no longer repaired. The fact that sheep were still grazed communally on the moor meant that everyone had to go out together on a particular day rather than individually, but fencing of individual land facilitated variability in land use. Less use was made of crofts for raising crops, and they could be used for grazing sheep all year round.

b. Reseeding schemes and apportionments:

Another illustration of the individuation of land use is provided by comparing the number of apportionments granted by the Crofters Commission for Lewis in the last 10 years with the number of township reseeding schemes carried out during the same time (see Table IV).[1] A crofter may apply to the Commission for an area of land (apportionment) to be sliced out of the township's common grazing land and given to him for his own use; theoretically, his share in the township's common grazing land is reduced if his application is granted.

[See p.x--Analyst]

178 land is reduced if his application is granted. Also,
311 a group of men in a township may apply to the Crofters
232 Commission for permission to fence off a portion of
233 the common grazing land and improve it as grazing for their mutual use. Grants are available for both schemes. The township reseeding schemes, adopted widely after their introduction, have been superseded by the number of individual apportionments.

The first township reseeding schemes in Lewis were tried as an experiment in Ness, Harris, Barvas
[654] and Bragar. "The Department of Agriculture fellow watched us every step because it was an experiment. Oh, there were times we cursed him and wanted him away." In Shawbost, a few interested crofters went around the village to see if others were interested. "We got a bad name for it; no one could see anything to it. But those people got the benefit of it." According to one man, initial reluctance to participate in the schemes was overcome when the agricultural advisor pointed out that if they overstated their costs, they would not have to pay much money themselves.

Between 1959 and 1962, seven township reseeding schemes were developed in North and New Shawbost, and four in South Shawbost. They were intended to give

241 the edge over non-crofters. "Squatters can do what
178 they like, cut peats, put sheep and cattle on the common
423 grazing, but this is a privilege, not a right."
829

The clerk of a grazings committee says, "When it comes to an argument between a crofter and a squatter, the crofter always wins. A squatter has rights only with the grazing committee's permission. If one crofter disagrees, the squatter is out."

241 A squatter muses bitterly, "I wanted crofting status
423 because I wanted to get a Department of Agriculture
578 grant to build a house. I work on the peat road; I go to all the fanks. But at a township meeting, they didn't want me to get crofting status. They were afraid I would start grabbing peat banks or apportionments in the common grazing or something. There's your brotherly love for you."

311 4. Subsidies: In the section entitled "Changing
654 Land Use" I suggested that the availability of subsidies has encouraged a more specialized investment in agricultural activites.

654 The villagers are keenly aware of outside institutions
829 which give money. They speak to each other about forms
241 which they receive from the Department of Agriculture and the Crofters Commission, in much the same way as they are curious about the number of tweeds which another

105 The
241 fact that crofting townships are located on marginal
654 land is one reason that the larger society is not motivated
• [311] to exploit the land. The Crofters Holding Act of 1886
[671] and subsequent legislation ensured protection of and incentives for continued maintenance of crofting and the crofting township.

Protective government legislation, grants and loans for housing, subsidies for rearing livestock, relatively low taxes, and the economic protection provided by a socialistic government in times of crisis have helped to maintain a core of crofting families for many generations.

105 The predominance of older persons in the township is
152 striking, but many of the younger people who have left
632 the island to work on the mainland return frequently,
166 contribute part of their salary to the remaining family
434 members, and plan eventually to marry and settle down in
584 the village or to retire there. Long-term residence of
[621] kin-linked families in a small area has in itself contributed to the boundedness of the township network.

105 The policy of the government, through developmental
241 agencies such as the Highlands and Islands Development
654 Board, has been to support economic strategies that
632 complement rather than interfere with the functioning of the crofting township with its small holdings and communal
ooo practices. The Harris Tweed industry is lauded as an

Appendix C

Balance Sheet of a Croft

*159 "The Muillear" has one croft and a two-acre buaile.
241 In 1970 he planted one-eighth of an acre with three bags
244 of potatoes, two of which he bought for L14/16, and
433 harvested 22 hundredweights. This was sufficient for
[435] his family's needs and provided some feed for his livestock for all but two months of the year. A small plot is planted with cabbages, for domestic consumption.

• [311] Seven-eighths of an acre is planted with oats; one-
[246] and-a-half acres with grass and hay; and two acres
[233] are used for rough grazing.

*159 The Muillear is interested in new ideas and techniques.
232 He goes to meetings and discussion groups sponsored by the
233 North of Scotland College of Agriculture, and has bought prize rams from the mainland to improve his flock. He tries to raise a few sheep using techniques of good husbandry rather than a large flock which would be given less effective care. He is teased by other crofters for "overfeeding," and for keeping his sheep on the croft and the township reseeding rather than out on the moor. "His sheep get homesick when they get out of sight of the croft." He wins the prizes at the Carloway Cattle Show each year, in a

ISLAND REGIMENTS

For a number of years it had been the practice for a considerable proportion of the older schoolboys during their attendance at the Secondary School to put in their training with the local body of Territorials—the Ross Mountain Battery. At the School Prizegiving of 1914, these boys attended in their uniform to be ready to go off the same evening by steamer en route for the annual training camp. Before the School re-opened, the Territorial Force was mobilised, and for some of these lads there intervened four long years of toil, of fighting, and of sickness overseas, before they ever saw their homes again. 175* 702 704

Later (1938), the unit became the 203rd (Ross) Battery of the 51st (West Highland) Anti-tank Regiment. It was whilst fighting as an anti-tank battery that, with other units of the 51st Division, the men were taken prisoner at St Valery in 1940. Today, after more changes, the battery is the oldest in 540 LAA Regt RA, TA (the Lovat Scouts). In 1960 the Ross Battery received the Freedom of the Burgh of Stornoway in recognition of a century of voluntary service to the community and the nation.

LAND USE AND CROFTING

The history of land use and the crofting system in the Highlands and Islands (see Chapter 5) is full of difficulties. In the older days of the clan system, before the rot set in, though the clan members belonged to the chief, they also belonged to the land and the land to them. In such a climate, the agricultural system, for it was such then, was in a reasonably healthy state; the land was worked to the full. Good land was available for the support of the clan, and as often as not in good years there was ample produce, crops, and livestock, to send south to well-paying markets. That fertile lands abounded is indicated by the reports of visitors in various centuries. But times changed. The increase in population after the breakdown of the clan system by statutory legislation, and the policy of population placement carried out with a rigorous enthusiasm, planted seeds of discontent—in particular a hunger for land. The land was in any case becoming ever more inadequate to support those already on it. 241 614 82 311 • 175* (443) [161] (656)

The story of the agrarian troubles in the Highlands area is well

documented; and Harris and Lewis played out their part in the agitation for more land. Briefly, when the clan system was broken down, the clansman found himself freed of the obligation of service to the chief. The chief, on his side, found himself thrown to the economic dogs. Payments in kind were no currency; a house in London or in Edinburgh had to be paid for in cash, and a London hairdresser would hardly accept half a dozen eggs for his services. The effect of the Heritable Jurisdictions Act was like a butcher's chopper. With a stroke a social organisation was given notice to change overnight, with no period of transition allowed. The chiefs looked to the land for their money. In the old system, their prosperity had been largely measured in fighting men. Now the pressures of economics demanded increased rents from those who were being called tenants. Increased rents can, however, be paid only when the land's productivity rises. The agricultural changes percolating through the Lowlands of Scotland had not even begun to penetrate to the Highlands area. Many tenants found that, unable to pay the increased rent demands, they were ejected from the lands which, incidentally, they had held by traditional understanding—written deeds were rare. Emigration started, and the vacant lands went to sheep-farmers, well able to pay good money for the grazings.

Some chiefs did give their tenants time to change to new methods of land use, and were careful not to make a breach between agriculture and grazing. Their tenants in turn improved the land, changing in particular from the old run-rig system, whereby a man working a piece of ground one year had the same piece the following year only if the dice were thrown his way. But the class of farmers' tenants called crofters (who had no security of tenure) or cottars (a squatter type with no legal recognition) found themselves on the verge of starvation. The few acres of ground they had, or to which they had been removed, were quite unsuitable for intensive cultivation to produce even the basic necessities of life.

The picture of land use was that of a great black pot boiling furiously with a brew of which the final taste was quite uncertain. When the boiling was controlled, the land began to be parcelled out, a share to each family. This led to a rigid, almost monolithic,

[TEXT CONTINUED ON PAGE 55]

agrarian order. Crofting townships were created which contained holdings of a uniform size, often fit to provide only a bare subsistence living. This is still so today. There were and are no means of achieving ambition through some kind of agricultural promotion, no ladder to climb to prove one's ability to win the land over to one's side to increase its yield. And as each family increased, the progeny demanded land. The family acres were divided, subdivided and fragmented to a vicious mathematical system: more people, less land.

In the nineteenth century, many estates were sold. The newcomers, with no kinship ties with the small tenantry, saw that the only way to make their estates economic was to establish large farms, which meant the eviction, by force if necessary, of the small tenants. This is what happened. For those who did not emigrate, it was a life of huddling around a weak fire, whose flame itself could hardly stand, and thinking of the prospect of starvation and the 'old days'. Thoughts nourished on these old days became the root of action; and a fierce agitation for land reform started. The Minutes of Evidence of the Napier Commission (1882-4), of the Deer Forest Commission (1894-6) and the several official reports on the conditions of the crofters and cottars, give ample evidence of bitterness and despair as the result of poverty and lack of opportunity. About 1870, unrest in the congested areas of crofting townships became a political issue. The flames of ideals were burning high and bright. Ideals were transformed into action: take the land!

By 1880, the ripples from the stone flung into the agrarian pond were reaching the general public. Sides were taken: one stood either on the economic touchline, or on that dangerous thin red line of sentiment based on high feelings and a deep sense of wrongs being perpetrated on fellow humans. The landowners naturally insisted on the right to move into an era of land use in which management was not hampered by affairs of sentiment or philanthropy. Governed by the cold principles of business, they hardened themselves in the face of their attackers. And though they pointed to arrears in rent, and their inability to improve their land agriculturally while they had tenants not of their own choosing, they faced mounting antagonism.

5 AGRICULTURE AND FISHING

THE economic possibilities of the peat blanket of the island, particularly in Lewis, have attracted the attention of many would-be exploiters. Sir James Matheson's advisers formed the idea that the Lewis hags could be turned to a good profit, and Sir James's series of peat reclamation and improvement programmes are still echoed today. He first cast his eye to the west, north of Achmore, a township set up more than a century ago on deep peat. The peat reclaimer he employed was none other than Alexander Smith, one of the best-known 'speculative' agriculturalists in Scotland at the time. Smith had already transformed the Carse of Gowrie from bog to a fertile tract of land; could he not do the same in Lewis? The site chosen was seven miles from Stornoway and the little hamlet established there was called Little Deanston, in recognition of Deanston, Perthshire, to which Smith belonged. The soil consisted of bog-moss, varying in depth from 3 to 8 ft. Sixty acres were wedge-drained and laid out in fields of ten acres enclosed with ditches and turf fences. Ploughing and trenching began and fertilizing agents were applied, including clay marl, shell sand, guano and dissolved bones. Two of the fields were put through a course of arable cultivation, the others being laid down in grass. After the fields had been worked for a few years it was found that the driest ground gave the best results. In time the land was handed over to some crofters from nearby Lochganvich, but in 1850 it was abandoned because of the difficulty in getting seaweed for manuring; and besides it was not possible to keep the land in good heart and to do fishing as well. The tract of land concerned today still shows a better quality of pasture than the adjacent natural moorland.

Smith gave his impressions voice in 1844, just after his first visit to Lewis, to the august members of the Glasgow Philosophical Society. The cultivation of the soil was as primitive as the

islanders' manufacture of cloth. The inhabitants were at least a century behind the times, though they were, he found, in no way deficient by nature. They were social in their own style, and they had very good heads, 'that is, for people not accustomed to habits of thought'. So far as agriculture was concerned, nothing in the way of draining the land had ever been accomplished; nor had any effort been made to penetrate the hard sub-soil. He held that the great scarcity of timber had been a serious handicap when it came to agricultural implements—to their renewal, repair or possible improvement. Under direction, however, he was convinced that improvements in land use would result in considerable benefits to the island. He added that he hoped the period of this improvement would not be far off and that visitors would find 'a green, pastoral land instead of a dreary waste'.

Yet not until 1928 was peat reclamation and development again brought out for an airing. This time, the benefactor was the late Mr T. B. MacAulay, a Montreal magnate, a son of Lewis connections. He gave £10,000 to establish an experimental farm in Lewis, and a site on Arnish moor, not far from Stornoway, was chosen. It was typical of most of Lewis: black, water-holding peat, which when squeezed, instead of allowing water to escape from it like a sponge, oozes itself through the fingers. The aims of the farm were to provide additional arable land on which to grow winter fodder, and to improve, at as low a cost as possible, the grazing on the moorland. Fifty acres were certainly converted from moorland to arable, and this formed a basis for an experimental extension to another 100 acres. By 1936 the farm had a sales income from produce of about £1,400. The stock in that year included 40 head of thriving cattle, including 15 dairy cows, 20 poultry, 140 blackfaced sheep, and some fattening pigs. The sheep were a late addition, made with the dual aim of pasturing on moorland too deep and soft for cattle in wet weather, and of improving the sheep strain of the island.

By 1938, it had been shown that some lasting improvement on moorland of reasonably favourable slope could be effected at a materials cost of about £3 per acre, and without heavy labour costs. Thus, the common grazings held by the crofting townships could be improved, if a co-operative effort were organized. So

far as the reclamation of arable land from moorland was concerned, however, requiring as it did under-draining and cultivation, the labour costs were heavy, approaching the £20 per acre mark including the liming and fertilizing.

Though the farm was used for dairying with some reasonable results, the moorland acres put into good heart at Arnish were left to deteriorate. The run-down of the experiment followed the depression of 1933. Funds dried up, and in 1939 the farm was let to a tenant. But the lesson obtained from the MacAulay farm was a good one. By simply dressing with shell sand, of which large quantities are available on the shore-lands, applying some form of phosphate and seeding with cheap clover or ryegrass—involving no cultivation—large areas of moorland can be persuaded to do a good job. The work at present being undertaken by crofters to improve moorland grazing is worth mention. Areas of land have been given a surface application of approved compound fertilizers, phosphates, lime or shell sand, and selected grass-seed mixtures. The results are literally a sight for sore eyes, and bring Alexander Smith's 'green, pastoral land' close to realisation. Although individual crofters have taken advantage of the help given to regenerate rough grazings, the most spectacular results have been seen on the township common grazings; most of these have been fenced off and improved. Today, something like 14,000 acres of lush green pastures are steadily spreading over deep peat where formerly grew only sedges and brown heather.

To end this aspect of land use in Lewis on a historical note, the story of re-seeding had its beginnings during the time of the Napoleonic Wars. A minister who had some land at Barvas, on the west coast of the island, decided to attempt the reclamation of useless heather-bound and bracken-choked land. He sanded the area with shell sand, seeded it with a good strain of grass and used sheep to tamp in the seed. One can imagine what Lewis would be like today if the Barvas minister's work had been followed up by Alexander Smith and those who set up the farm at Arnish.

for mutton and for wool, the right type for translation into Harris Tweed; the predominant breed is the blackface, whose fleece is hard, wiry and long-lasting. The demand for raw wool has also encouraged larger flocks among crofters in such places as Barra, where virtually no weaving is done in the immediate locality. In general there has been since 1911 a 40 per cent increase in the livestock carried on the island's crofts, about twice as big a rise as found anywhere in the seven crofting counties of Scotland.

In an attempt to reduce Lewis's milk imports, in 1962 three crofters at Garrabost on the Eye Peninsula combined to set up a small dairy farm using the lands of their three crofts. A new dairy byre and dairy premises were built and equipped with the necessary electrical equipment. Grants were given by the Department of Agriculture & Fisheries for Scotland, the Crofters Commission, and the Highland Fund Limited. The first year of operation was closely supervised by the Lands staff of the Department at Stornoway and guidance given as necessary. The milk is retailed in Stornoway and district and amounts to about 5 per cent of Lewis's daily consumption. This little scheme has shown that the island could with some organised effort become independent of milk imports, which have been estimated at upwards of £100,000 worth per annum. Over £70,000 per annum is also spent on imported butter and cheese.

In 1947 the number of crofts in Harris and Lewis was 4,020. In 1971 the figure was 4,146 (3,592 being in Lewis), representing a slight increase in a quarter of a decade. Thus, crofting as a land use activity in the island provides a fairly stable element in the economy, although it is subsidised by the crofters' participation in the fishing and tweed industries. A crofter, it should be mentioned, is often a tenant of more than one croft, working them together as a unit. These units vary in size, the greatest bulk of them (about 60 per cent) having up to 5 acres of arable land. About 2 per cent contain over 30 acres of arable land. In recent years there have been proposals for the better use of the reclaimed moorland, particularly for cattle-raising, which would offer the crofter an increased cash yield from his interests. The annual reports of the Crofters Commission indicate, indeed, that the trend to the small croft obtained from the fragmentation

of larger and more economic working units of over 30 acres of arable land is also apparent in the southern Hebrides, the west mainland of Ross & Cromarty, Argyll (mainland and islands) and Caithness.

The acreage of common grazings held per holding varies from under 50 to some 200. The crofts, as already mentioned, are in townships, of which the island has 168, half being fenced and half consisting of individually fenced crofts. During the winter most of the crofts are laid open for winter grazing by sheep of general ownership. Manure resources are mainly dung, seaweed, shell sand and of course artificials where necessary.

A new aspect of crofting in Lewis is its extension into forestry. A recent survey by the Forestry Commission indicated that under 400 acres of the land not being used for crofting were suitable for afforestation, and that these acres were made up from twenty-three different plots. At Garynahine Estate can be seen the beginnings of a real afforestation unit of some 500 acres, a scheme of the utmost significance for the economic future of Lewis and for the relationship between crofter and landlord. Too often in the past this relationship has been biting, hard and inflexible; in particular the crofter was understandably unwilling to release good land for planting trees. But the crofters of Callernish agreed that the right of usage of 285 acres of the common grazings belonging to their township should revert to the landlord, this land being thrown in with 220 acres of the Garynahine Estate. Labour comes from the affected township and others in the area.

FISHING

Early beginnings

It is the humble herring that has contributed so much to the island's economy and its history. At a very early date in history, the Hebridean fishings were worked by Frenchmen and Spaniards who must have found them rich enough to repay the long journey and weeks away from home in the cold Minch waters. It was not, however, until the end of the sixteenth century that the wealth of the Minch was really discovered, this time by the fishermen on the mainland of Scotland who copied the tricks of their trade

HARRIS'S OFFSHORE ISLANDS

Scarp

Until 1972 Scarp was the most westerly inhabited island in Scotland, separated from the Harris mainland by a strait which is about half a mile across at its narrowest, coursed by strong tidal currents. The island is about three miles in diameter, rugged, especially in the north and west, with cliffs on all sides; the maximum altitude is nearly 1,000 ft. On the east side lies a tiny marginal belt of good land, machar and soil; on this green shelf, about one-third of a mile long, were all the crofts of the Scarp settlement. Many stand deserted, and abandoned lazy-beds in sites beyond the present settlement indicate a denser population at one time. The island's population-carrying capacity was severely limited by the minute amount of land available for tillage: of a total of about seven square miles only half a square mile can be used. Climatic conditions and soil type also restrict the range and quality of crops grown.

Scarp was originally settled about 1810 and was occupied by eight farming families who were reasonably comfortable. Not only did they have the island to themselves, but they had access to good pasturage on the Harris mainland opposite. About 1823 thirteen small townships between the head of Loch Resort, Harris, and Bunabhainneader were cleared, some of the displaced families coming to Scarp. Some emigration back to Harris took place in the 1840s, but when about 1868 the proprietor divided Scarp into sixteen crofts instead of the previous eight holdings, these were further divided by the people themselves, trying to accommodate their families and friends from elsewhere. In 1861 the population was 151; the peak was reached in 1881 with 213 persons. In 1951 it was 74. Communication with the Harris mainland is by boat, plying between two stone-built jetties.

The local economy was essentially a subsistence one, with self-sufficiency in such products as potatoes, turnips, cabbages, oats, milk and fish. After a break of some years lobster-fishing has recently been reinstated as an occupation. Oil lamps are the only lighting, though a few houses have piped water. The small shop

178
311
232
233

extra grazing for cattle, but by that time the cattle were already on the wane.

"The original idea was to provide an early bite for the cattle, because everyone had cattle then. Otherwise they would need to buy more baled hay to see them through the winter."

"Almost everyone in New Shawbost had a share in the 1959 schemes, about 26 altogether. Then it was mostly cattle. We took turns bringing them in at night, and I remember taking 33 home, with some left behind for the night. The cattle were grazed over the summer, and the [221] lambs were put on from August 10 to October 10. Many dropped out after the first four or five years, when they stopped keeping so many cattle. When the number dropped to 13 or 14, they started using the schemes for mixed grazing, and then some took up their shares again. When we only had the cattle and lambs, we didn't need a souming; but when the mixed grazing started, we had to keep down the number of sheep. Last year we had difficulty with disease."

A forty-acre scheme in North Shawbost started with about eighteen crofters and non-crofters participating; there were 37 cattle altogether. Now only four have cattle; the rest have sheep. The sheep-keepers say,

178 "The cattle give too much trouble." A smaller scheme
311 is grazed only by sheep. On the schemes where mixed
232 grazing is practiced, a number of conflicts arise between
233 those who have only sheep, and those who have cattle as
[578] well. To accommodate different demands, one township scheme was divided with a fence; cattle were put in for a month in one part, and then shifted to the second part. The sheep were then brought into the first half. All stock had to be removed from the scheme a month before the lambs were weaned, so that all worm eggs and other harmful elements in the dung of animals previously present would have time to die. What was once used for a single purpose by everyone now has to be divided.

"I paid one pound a head to put cattle on the
[435] reseeding," says a man named Iain. "Now I have to move
[578] them off already. Those sheep people want it for themselves. I won't use it if they're going to be like that. Next year I'll have the use of two crofts and my apportionment. And now that I have my own tractor I
[409] can put a load of sand at the bottom of the croft to
[242] make the grazing better."

According to another person, who also keeps cattle
311 on the reseeding, "Some people want to move their live-
233 stock on and off the schemes when it suits them, like Iain,
232
829

311 who wanted to keep his bullock on the reseeding for
233 another week because he wasn't ready to sell it; but
232 he should have known the rules. Some people want to
829 keep both cattle and sheep on at the same time, although the agricultural advisor says cattle should go on first, because sheep go for shorter grass. Other people want to put on twice as many sheep as those who have both cattle and sheep. When they stop keeping cattle, they think they're not getting a proper share of the reseedings.

"The Crofters Commission wanted communal township schemes. But people have different demands. It's better to go for an apportionment. You can do what you want with your own land."

178 The number of township members participating in
311 the communal schemes is diminishing to the point where
232 it is less expensive, and much less subject to conflict
423 arising over differences in stock-keeping, to invest in
476 individual holdings of land rather than try to sustain communal practices.

Shawbost

592 unmarried sibling. Eleven households consist only of siblings who have never married, men and women who in 1971 were 45 years old or older. Two widows live with [589] their unmarried siblings. Sixteen widows or widowers live alone, and sixteen unmarried persons live alone.

241 592 423 671 888 The large number of households occupied by single, elderly people reflects the use of the croft as a place of residence rather than as an agricultural unit, a view of the croft that was given legal expression in 1968 by the Miscellaneous Provisions Act. Before 1968, [428] the croft went automatically to the eldest son if a crofter died intestate. Since 1968, the rights of different claimants must be considered and tenancy by a new person must be confirmed. District and county councillors argued for this change, saying that a widow was often left on the croft and her security endangered because the eldest son was usually far away from the island, in Canada or some other country. In other words, rather than an agricultural unit which should naturally be taken over and worked by the male head of the household, the croft is seen as a place of residence for the infirm and for the aged, and especially for the aged female.

657 185 423 888 The Crofters Commission has suggested that elderly people be allowed to rent small plots of land on which

657 185 423 888 311 their houses are located, and that most of the land be freed for use by more active crofters, but the ideology associated with possession of the croft makes such a plan extremely difficult to implement. "The croft is your base, the only thing you have. You don't want it taken away, even if someone else is using it already anyway. Our county councillor suggested amalgamating the unused crofts at a recent meeting. No one said anything, but no one wants it."

592 241 311 Of the five households that have the use of three crofts each, one consists of a bachelor who uses the crofts for grazing a large number of sheep. A second household is composed of two brothers who had stayed at home to take care of their aged parents. One of these brothers recently married, after the last parent died. These men keep cattle and sheep, and both weave.

592 241 311 288 A third household is headed by a married man who has recently sold most of his livestock in order to "concentrate on the weaving." His father, who used to haul peat with a horse and cart in exchange for the use of grazing land so that his family never had to go to the sheilings, died a few years ago. "My father was a crofter only. The weaving didn't start until the 30's. He was wounded in the war. He got a pensio and sold a cow or a few sheep each year. But I didn't

592 24 31 288

like to leave the loom for the time it took to look after the sheep."

592 23 24 [233] [246] [288] [463]

A fourth household consists of three unmarried siblings in their 40's and 50's who recently sold their cattle and now keep only sheep for their own consumption. They cultivate a small amount of oats and hay to feed the sheep during the winter. The brother who was largely responsible for taking care of the livestock is now "concentrating on the loom," and his brother works in the mill. Their sister, who used to work in hotels on the mainland, now keeps house for them. Described as a "self-contained family," they have a tractor and a deep-freeze and take care of their peat and the harvesting of crops by themselves. One of their crofts has become too waterlogged even for grazing and was sold recently to the son of a local crofter, not for agriculture but as a prerequisite for applying to the Department of Agriculture for a housing grant. Only tenants of crofts can apply for such grants. As this particular croft is too wet to be cultivated or used as a house site, the only motive which the new tenant has to become a crofter is to gain access to governmental subsidy.

[407] [404]

654 423

592 233 31

The fifth household is composed of a retired couple and their son and his wife and family. They have no cattle, and use the crofts for grazing sheep.

184 share their characteristics. So to gain a sense of pro-
105 portion from the start, we must map the location of Scots
[128] countrymen, their numerical importance, and their types
102 of grouping. Let us begin with the first of these three
13 aspects, their regional location (Fig. 2).
• 311 The base map on which the data are plotted shows the
[102] boundaries dividing the hill masses of the Highlands and
102 Southern Uplands from true 'lowland'. This hill country
13 is mostly covered by rough pasture (left blank on the map)
• 311 within which lie strips of 'Isolated Arable' with other
184 improved land in the valleys and along the outlying coast-
226 lands (shown in black). This hill country includes the
241 Scottish Isles, with the exception of Orkney, which falls
361 rather into the category of 'lowland'. It is largely devoted
[241] to sheep farming and crofting, or left to grouse and deer.
[427] The lowland area from the Orkneys to the Tweed and Sol-
way is devoted to mixed and dairy farming with lowland
types of small-holding, except, of course, for 'Industrial
Regions', which include most of the urban area of Scotland.
[226] Within the 'three-mile' territorial limit from the coast
lie the inshore waters, in which local fishing was once
important, and might again become so; these are left
white on the map (Fig. 2). By contrast to their narrow
extent on the East Coast, their width is notable in the
Northern Isles and on the West Coast.
102 The problem set in making this map is to show two
13 different worlds, as it were: the Highland and the Lowland.
184 The two are rarely envisaged together, and much confusion
128 of thought and policy results. To master the map, the
182 reader may scrutinise first one part, the Highlands (cover-
ing the other with one hand), then the other part, the
Lowlands (in the same way): thus each will appear clearly
in turn. Both can then be envisaged together.

FIG. 2.—Map to show (i) the use of land and sea in and around Scotland, with special reference to the Crofting Townships Zone of the NW. Highlands and Isles, and (ii) the average size in each county of labour-teams of farms and small-holdings in the Lowlands

182 Let us begin with the economic and the social signi-
184 ficance of the Highlands and Isles with which we are
concerned. Economically the crofters' 'living space' is
• 311 the narrow interrupted belt of improved land (shown black)
[241] which is generally fronted by the sea and its inshore waters,
[427] and is backed by the Crofters' Grazings (enclosed by line
[361] C on the map). Some 700 crofting townships or com-
munities are found in Zetland, the North-west mainland
and the Western Isles, each with its Common Grazing;
the line C also encloses a small area devoted to other
grazings. Deer forests predominate on the eastern, main-
land, side of the line. On the remainder of the hill country
are to be found the hill-sheep farms, with other small farms
and small-holdings.
174 In the past the fishing crew at sea and the joint labour-
62 team on land formed the communal units contained within

Key to use of Land and Sea
(Highland, Island and Urban Areas)

1. The dotted line C . . . . . C encloses the Crofters' Grazings, mainly 'Commons'.
2. Black area: strips of 'Isolated Arable' within the rough pastures of the Highlands and Southern Uplands (left blank).
3. Horizontal ruling: open sea, outside the 'three-mile' belt of 'inshore fishing' (left blank).
4. Vertical ruling: urban and industrial regions.

Key to Size of Labour-Teams of Farms and Small-Holdings
(in the Lowlands)

The symbols show the average number of employees per team in each county.

(1 symbol = 100 teams)

(a) Per Mixed and Dairy Farm
- 2·2 to 3·8 (3·1)
- 4·1 to 5·6 (4·9)
- 6·4 to 8·2 (7·1)

(b) Per Full-time Small Holding
- 0·7 to 1·0 (0·85)

(The numbers in brackets are the averages for Scotland.)

174 the township; and to each were allotted the rights of the
226 common grazing and the fishing grounds. For more than
241 a century the croft has been held individually, though in
473 the townships the common grazing is still held in common.
621 Beyond these 'homely' limits lie wider horizons, in the
632 past those of seafaring and of droving or the chase, and
[198] today of fishing and gillieing at home, or of ocean journeys,
urban occupations or colonisation.
182 In the Lowland regions each symbol represents 100
184 holdings. For (A), 'mixed and dairy farming', the par-
241 ticular type of symbol shows the average number of workers
employed on a farm-holding in each county. On each
farm the employed workers form what may be called the
'Labour-Team'. A team may be 'small', 'medium' or
'large'. The Scottish averages of these three types (indi-
cated in the inset key to the map) are roughly three, five
and seven workers per team. Four 'casual' workers are
counted as equivalent to one 'permanent' worker, but
farmers' wives are excluded. Under (B), for the same
Lowland counties and areas, full-time small-holdings are
[593] shown separately. The Scottish average of less than one
full-time worker employed, most often a son or daughter
of the small-holder, is typical of all the counties.
241 As to the relative importance of the different classes of
[162] farms and small-holdings in Scotland, true agricultural
land-holders number 68,000, of which fully one-third hold
part-time holdings (like the Island crofters), one-third
'full-time farms', and rather fewer (one-fifth) hold 'full-
time small-holdings'. The remainder accounts for other
types of less importance. The farms predominate in terms
of improved land, full-time employment, and of course of
• [311] production. As to area, farms cover 80 per cent of agri-
[464] cultural land. The farmers employ nearly 90,000 workers,
[162] [refer to map p. 16 ·· analyst]

241 Scotland had begun to lag since her pioneering effort from
134 1750 to 1880.
198 Fortunately, Scotland is now recognising that in peat
[654] reclamation, on the one hand, and the improvement of
rough grazing, or at least its maintenance, on the other,
[185] there lies a problem of national importance. More than
half the land surface of the country consists of mountain
• 311 and heath land used for grazing, not including 'deer
forests' from which sheep had been altogether excluded.
The arable land of Scotland is less than one-sixth of the
whole, with about one-twelfth in addition under permanent
grass. Moreover, since most of the enclosed land is distant
from the area of rough grazing, the latter is partly wasted.
The difficulties of soil and sea and of the whole economic
situation are great, and must be understood.

(a) THE ISLAND LANDSCAPE, LAND-FORMS AND GEOLOGY

1. Aspects of the Isle

131 Lewis-and-Harris, the most northerly isle of the
Outer Hebrides, and the largest, is roughly lozenge-shaped.
Although only thirty miles in width, it is over sixty miles
in length. Attached to Harris parish is the little isle of
[103] Berneray, half a dozen miles farther south. It puzzles
the stranger that, while the archipelago of the Outer
[873] Hebrides is best known to the inhabitants as "The Long
Island", Lewis (or the Lews) and Harris, which actually
form one island, are spoken of as separate islands.[1] Yet
nothing could be more natural. Before the making of

[113] [1] "The Long Island", Gaelic *An Eilean Fada*, as a name for the Outer Hebrides has the sanction of traditional usage, as Alexander Carmichael noted in his Introduction to *Carmina Gadelica* (vol. i, 1900; and 1928).

PLATE II. AIR VIEW OVER STORNOWAY BAY, LOOKING NORTH

The Point, with the Inner harbour behind, is the nucleus of the burgh; nineteenth-century extension filled up the ground inland. Lews Castle is on the left

/facing p. 27/

(Fig. 6). The anemograph at the Butt of Lewis records one of the highest of British averages for gales and frequent breeze: for 1930–35 the mean frequency of gales (winds over 38 miles per hour) was 62. The mean speed for December and January is 25 m.p.h., which can best be realised by imagining winter travel in an open car with no wind-screen. This mean maximum is a reminder of the difficulty of tree-growth, as gales loosen or quite uproot the trees. It also helps to explain the proverb: "A long sleep in a big wind" (*cadal fada ri gaoith mhoir*). This is as true for the byre as the bed-closet, for what could cattle-beast or man be doing out of doors in a winter gale? Although the mean speed drops from 18 m.p.h. in April to 13 or 14 m.p.h. in July and August, it rises in September to 18 m.p.h., with ill effects on the harvesting of late crops. Winter winds blow in full force from the end of September to mid-February at an average of 22 m.p.h. or more. The gales make winter fishing dangerous, and their force smashes breakwaters on the west coast.

Yet winds at the exposed cliff-height of the Butt are only slightly greater than those of similarly placed spots on the mainland coast, or islets like the Bell Rock (Firth of Tay), and the east of the Island is comparatively sheltered. For example, the mean annual speed of wind at the Butt was 19·2 m.p.h., and for the same period at the Bell Rock it was 18·2, at Aberdeen 9, and at Kew 7·6. When the anemograph at the Butt was moved even to a 'well-exposed' spot near Stornoway, the average number of gales for 1937–40 dropped to two-thirds of the preceding triennium. With shelter, the difference from the Butt and the approach to normal conditions on the mainland would become greater still. The planting of shelter-belts would foster crops, comfort and activity on the Island.

(B) VEGETATION

1. *The Vegetation-types and Pastures of the Highlands and Isles*

In order to see the Island problem in true proportion, the types of vegetation and rough pasture in the Highlands and Isles should be outlined. Dr. Hardy's reconnaissance botanical survey of the Highlands, with its coloured map, has been utilised in the compilation of *A Reconnaissance Map of Vegetation of Scotland*.[1] The latter has been boldly simplified in Fig. 7.

The Highland pastures are of two main regional types, eastern and western, with the addition of a few great stretches of peat moor. East of a line from Stirling to Inverness, heather is dominant, as it is on the heights around the Dornoch Firth, from north of the Cromarty Firth and Ben Wyvis to the border of Caithness. To the west of this, heather, though still found, is mixed with grass and sedges. The grazings of the North-west Coast have been the adopted home of Cheviot sheep for over a century, for Cheviots are grass-feeders which cannot thrive on heather-tips. True, acid 'Dry Grass Moors' lie inland from the Beauly Firth and Dingwall. On the rest of the West Coast from Gairloch and Loch Torridon south to Kintyre, 'Marshy Grass Moors' with but little pure heather clothe the lower slopes. These give way on higher slopes to 'Mountain Pastures', reaching up to about 2500

[1] M. E. Hardy, *Esquisse de la végétation des Highlands d'Écosse*, Paris, 1905; also *Scot. Geog. Mag.*, 1906, June number with map, and May number with text. A. Geddes and L. D. Stamp, *A Reconnaissance Map of the Vegetation of Scotland* (Ordnance Survey, 1/625,000: 10 miles to inch), 1953; explanatory pamphlet in the press. A résumé by L. D. Stamp has appeared in his *Land of Britain: Its Use and Misuse*, 1948, based on Tansley, *The Vegetation of the British Isles*, 1946.

feet. These marshy grass moors, with their mountain pastures above, are the adopted home of the hardy Black-

FIG. 7.—Map of vegetation-types and pastures of the Highlands and Hebrides

face sheep. Wherever in the west the slopes drop fairly steeply, good pasture grass with some heather may grow, or rather did grow until bracken overwhelmed them.

Inset into the Highlands are three desolate tracts of boggy 'Peat Moor', in Sutherland, Rannoch Moor far to the south, and on the plateaus of Lorne and Mid-Argyll; while marginal to the Highlands are (1) the drier and more dissected plateau peat moors between Lochnagar and Stonehaven, and (2) the intermittent stretches of Lowland peat moss.

Finally, intermixed with these are strips of surviving or planted woodland. Below the heather moors of the western Highlands stretch the great pine woods of Atholl, Deeside, and Speyside and the Moray Firth. As the heather thins out, towards the West Coast, pine gives place to oak. Near both are found the graceful silver stems of the birch, with its small resistant leaves. These woodlands invite the modern forester, who brings in pine, larch and firs in the east and, in the west, notably the Sitka spruce, brought here from the rainy western highlands of British Columbia.

The uses to which the pastures are or have long been put, are three: as crofters' grazings—mostly 'commons' (and so indicated on the map), as sheep farms, or as deer forests. (1) On the 'commons' there is close grazing for both cattle and sheep by crofters near the townships or the holdings, and much peat-cutting. (2) On the hill sheep farms there is more or less regulated burning and some hill draining but almost no cattle pasturing; and as a result of both facts, bracken has invaded the grassier moors. (3) On the deer forests almost no care is given and the heather, scrub and bracken are coarse and strong. An indication of the margin of the commons, according to whether it 'marches' with farms or with deer forests (given in Fig. 2 by line C), is also shown in Fig. 7 because of its marked effect on vegetation.

2. *Plant Life in Lewis-and-Harris*

Lewis has been dismissed by many as a floating peat bog, and its name has even been derived from *leodus*, a bog! For good or ill, peat influences the Island, its history, the distribution of its people and the economic and social features of their life. In Lewis, peat once covered everything except the narrow fringes of sandy machar, the surface of the inland waters, jutting rocks and steeper hills where drainage is rapid. Man's encroachment on that carpet has so far been mere nibbling. Except for the machar lands, every acre of ground occupied or cultivated by man has been reclaimed from peat.

The Map of Vegetation and its Key portray the distribution of the main plant communities (Fig. 8).[1] All plants are of low habit with small leaves, well protected from excessive transpiration. They are mostly perennials or biennials; annuals are comparatively few. There is no burst of flowering save where the heather blooms on better-drained slopes, or where shell sand has blown, enabling clovers, vetches and meadow-sweet to give colour and scent. Moss, sedge and dwarfed heather prevail widely in tussocks.

Constant cropping by sheep and cattle, and also deer, tends to keep vegetation low, but on the wide, boggy moors this is a minor factor. Nor is there much systematic heather-burning. Even upon the islets of inland lochs, untouched by grazing animals, and in spite of better drainage due to the undercutting of the waves, growth is not really luxuriant. Bracken, however, is found on the islets, and a little on some former sheep farms, but not on the heavily grazed common pastures, for cattle keep down bracken.

[1] [see p. 50 -- analyst]

3. *Plant Communities of the Island: Hill Moor, Peat Moss and Machar*

The types of pasture in the Island should be compared with those elsewhere. The peat moors of Lewis resemble those of northern Sutherland. The machar lands of the Uists, and of Tiree and smaller isles, surpass those of Lewis, while on the mainland and Inner Isles raised beaches provide workable, well drained soils. The 'rocky hill pastures' of our Island correspond to the rockier 'mountain pastures' and 'plateau summits' of the Highlands, and the 'fair' and 'hill pastures' of Lewis rather to their widespread 'wetter moors'. Grazing conditions are of course, similar in crofting areas alone. The edging of heather above the sea-cliffs of the Island and on the western mainland forms a picturesque element of the landscape, seen from a passing vessel, but only a narrow strip of the pastures. The plant communities shown on the Map of Vegetation (Fig. 8) must now be outlined.[1]

(1) On the *Rocky Pastures* the scattered patches of soil are covered by a low and close sward, almost exclusively of perennials and grasses, such as bent (*agrostis*), common and brown, sheep's-fescue grass and wavy-hair grass (*festuca* and *Aira*); small sedges and mosses, with club moss and lichens towards the summits; heather, and fine-leaved bell-heather (*Erica cinerea*); and flowering plants like thyme, bird's-foot trefoil, tormentil and smooth heath bedstraw (*Galium*). Those rocky pastures prevail in the Forest of Harris (Plate XI).

(2) *Fair and Hill Pastures.*—Below the bare rock domes

[1] An authoritative flora of the Island is in preparation by Miss M. S. Campbell, F.L.S., British Museum (Natural History). Her "Flora of Uig" (Lewis) has appeared (Arbroath, 1945). For Dr. Hardy's tentative list of plant names see A. Geddes, *Scot. Geog. Mag.*, vol. 52, 4, 1936.

361 The chief advantage of moving uphill to the road has been
178 ease of communication and access to grocers' vans and mill-
311 spinners' lorries; but the disadvantage proves to be the
491 laying on of running water. A much-needed scheme for
water supply is now being applied by the Department of
[654] Health for Scotland. Scrutiny of a 'quarter-inch' map will indicate the chief facts and tendencies and the conditions they involve.

4. *Distribution of Population*

162 The distribution of rural population can be closely
311 estimated by inspection of a 'quarter-inch' map, where both the area of cultivation and the house dots are noted. Comparison with parish populations shows that on an average one dot represents seven or eight houses or families and thirty to thirty-five persons. Since there are now no large farms, cultivation indicates crofting, and, therefore, a typical density of one person to a little over half an acre, or 1000–1200 per square mile. Rural numbers over the whole Island show a density of about twenty-five persons per square mile. If the fishing grounds, with a sail here and there on the wide sea, were added, the density would be lower still! A single dot found with cultivation indicates crofts, which are hardly ever found singly. Where no cultivation is shown around a single dot, this generally indicates an isolated stalker's house, a shooting lodge by a road, or a shieling (*àirigh*) out on the moor.

(B) STORNOWAY

1. *Site, Plan and Development*

361 The plan of Stornoway and its harbour shows three stages in the growth of the town, the first two picked out

[TEXT CONTINUED ON PAGE 89]

175 natural zone, could not be extended. In any case, the re-
433 clamation of clay land tended to slacken as efforts turned
434 to fishing and kelp-making. The introduction or increased growing of potatoes added to the human, but hardly to the
[182] animal, food supply. Finally, while the beginnings of
311 medical knowledge and vaccination had aided the growth of population after 1750, veterinary science had made no
[232] progress, nor did it advance in the Island for many years to come. We may conclude that an average stock per Island
[422] family about 1720 was rather more than that of 1790, and the acreage relatively larger, while both were greater than the average of today, particularly in the Lews.

175 What, then, could a family have to eat, from such crops
262 and stock? While in winter even now there is almost no
244 milk to be had on a croft, and there would be little then, there was salt meat, dried or salted cod (or herring) and fish oil; oat and barley meal and some rye meal; cabbages; and, increasingly in the eighteenth century, potatoes. Martin included potatoes among the crops grown even on far St. Kilda in 1697. A century later it was written that the people of Uig, for instance, had, though 'unwilling', been induced to grow and eat them 'forty years before'; and the years tend to be under-estimated where changes are slow and memories long! But it was written of Harris that by June the meal and potatoes had mostly been consumed, "and such as cannot afford to purchase imported meal subsist chiefly on the milk of their cows and sheep, with what fish they may chance to catch, till their wants are relieved by the first fruits of their potato crops early in Harvest".

175 We conclude that with even less money but a little
511 more grain the population in the Island had fluctuated
162 about a mean for some centuries before, as it had in so
171

593 On the mainland, both Lowland and Highland, an
outlying reclaimable patch of arable, lying near distant, little-
423 used pasture, frequently gave a single family the chance
[241] of a living. Such a site meant solitary toil for the man and his family; but there might be advantages such as
311 an occasional deer from the forest, or a post as hunting
[184] 'forester' such as was held by many a Gaelic hunter-bard. In the Eastern Highlands such a high-lying croft was
[224] known as *Ruigh* (anglicised to Ry-). Traditions of poverty
[823] with individuality in isolation were handed down, for example, from one of my forebears who held such a *ruigh*,
175 Rycorrach, one of several strung out along the 1250-feet
361 contour in a small, high valley off Strath Spey; the last
[511] of them was abandoned only recently. Such a *ruigh* may have originally been a summer shieling, only occupied when shortage of corn-land below, coupled with new possibilities of a little profit from sheep-shearing, led to settlement there.

178 At the fringe of the Island's deer 'forests' of North
361 Harris and Park, stalkers are still found in lonely lodges
224 and dwellings, individuals often of character and worth, as they need to be; and a few isolated shepherds, such as
233 one finds on mainland sheep farms, dwell on small islets.

But in the Isles, isolated, high-lying spots for single crofts
361 are rare. And the clearest distinction must be drawn
621 between the true solitude of a single, isolated cottage or croft and the sociability of a group of four or five, or even
184 two or three, crofts, such as those of lobster fishers; for even a few families form the germ of a community, in work and in leisure.

175 The potentialities of co-operative practice were over-
178 looked by agricultural reformers, excusably enough. For when new methods were required, run-rig kept back the
654 pace to that of the slowest, virtually arresting reform. Soon
476
241
423

134 that no initial reclamation had been needed on the scatt.
241 In each year of cultivation, it is true, manures of a sort, principally seaweed and sooty sods from the roof, are applied; but they form a temporary improvement only for the crop to be taken, and do not constitute reclamation. After manuring, the grasses and clovers are simply turned over and the land, 'rested' and manured by cattle, straightway gives its best crop.

175 It is otherwise with what is won from the moorland.
311 As Dean Monro wrote of the reclaiming Lewisman in 1549: "In this country all is peat moss-land at the sea coast" (the long machars of the west of Uist give place to rocky coasts round much of Lewis), "and the place where he wins his peats this year, there he sows his corn the next year; after that he guids it weill with sea-ware". Even where the slopes are fairly smooth, the peat land has not the uniformity of the machar and the continuity of its arable strips. In addition to sea-ware, sand may be brought by creel or by pony pannier to reclaim peat, forming a heavy burden. Moreover, the first crop is always a poor one, and may be almost lost. Although in his brief notes Monro used the singular 'he', we know that the peat was usually cut co-operatively by teams. Hence most of the hard labour of reclamation may, indeed must, have been done co-operatively too, but by small teams, not by the members of a whole township together.

233 The sharing of common pastures is the last, but im-
423 portant, feature of land holding in common. The two kinds of pasture required were, firstly, those close at hand, animals being tethered or herded in the crop-growing season, and secondly, the more distant summer pastures.
[632] The people of certain townships, which were without a large outrun close at hand, had to go some distance to

175 which heartened them for resistance in common against
829 landlord and State, both in the agitation for reform of the Land Laws during the next ten years and in their demands for 'the return' of sheep farms to crofting, which continued until all these were divided soon after 1919 and the ex-Servicemen's return.

175 Expenditure of capital in Lewis during more than a
423 generation, from the purchase of the estate in 1844 down to the death of Sir James in 1878, helped to maintain the
646 people and provide relief in bad seasons. It left Lewis greatly improved in roads and paths, in sea communica-
175 tions and in buildings of various sorts. Two real efforts had been made to utilise Lewis peat, industrially for paraffin
646 oil, and agriculturally by reclamation. Given the resources
•311 and knowledge of a century ago, these attempts did their
[161] initiator credit. Yet failure left the Islanders to continue crofting without either an additional occupation or the extension of croft land, even at the high population density (per acre of arable) which Matheson had found on his purchase in 1844.

175 Subdivision of crofts was the first result. A father
423 would simply divide his croft between himself and a son, who might not even be entered on the rent-roll of the estate, and the two would inevitably need more stock than before upon the common. The second result was simply 'squatting': the building of a house, perhaps with a tiny kailyard, on a piece of the 'skinned' land. As building went on overcrowding old sites, filth accumulated and springs were contaminated, crofting was hindered and cows became fewer per family, in spite of overstocking. By 1886 about two-thirds the number of the cottars and squatters found in 1914 were already in occupation. In 1914 there were over 3000 statutory crofts in Lewis, their

121 1794, for instance, their crews not only fishing but also
175 buying from local fishers. Islanders occasionally earned
228 a pittance as pilots, for until the charting of these rocky coasts navigation was most dangerous.

175 The herring industry was in the hands of 'adventurers'
228 (who 'ventured' their capital), and the Islanders benefited little. The British export was aided by a bounty which
[472] helped to capture the Continental market; but, as Adam
[439] Smith pointed out, no bounty was given to the small, open boats suitable for the north-west lochs. Thus the operation
175 of the Salt Duty after 1707 and of the bounty system from
228 before 1745 until 1786, illustrates two of the recurrent
656 blights upon "Public Administration" in the Isles. As Day wrote, their interests have had to suffer "either deliberately, for the benefit of other parts, or other classes in the kingdom, or inadvertently from ignorance".[1] Although the bounty system was widened to include small boats after 1786, the Salt Tax remained until 1817.

To overcome difficulties, the British Fisheries Society was founded with Government support in 1786. Although Stornoway then seemed too far afield, the Society's concentration upon larger settlements foreshadowed Lever-
• [311] hulme's principles after 1918. At Ullapool, Tobermory and Lochbay (Skye), and at Wick, quays and stores were constructed and dwelling-houses built, with croft land and grass for a cow, to be reclaimed. Although concentration at Wick led to the sale of the three western properties about 1842, the Society had done some good work in the West. The chief difficulty of the West Coast north of the Clyde area and south of Stornoway District remained: the lack of a well-marked seasonal migration of herring.

[1] J. P. Day, *Public Administration in the Highlands and Islands of Scotland*, 1918.

175 for a firmer hold upon the land and for a return to aban-
178 doned sites. The communal possession of joint farms, held
433 directly or under tacksmen, gave place to individual possession of crofts. Yet the legal recognition of perpetual
(731) tenure in 1886 gave not only the crofter's home but the
[166] crofting neighbourhood a security unequalled in Britain.
[167] The use of moor and machar in common was retained; but its control for improvement or reclamation by the
175 estate or the township was weakened, rather than strength-
178 ened, by the Crofters' Acts. Confusion grew—both upon the arable land, subdivided, unenlarged and unimproved,
423 and also upon the common grazing, sorely overstocked in
427 spite of ever diminishing 'soumings' (or family shares) of cattle. Rating difficulties and anomalies appeared. Communal discipline, maintained at sea by fishing, was weakened on land after the abolition of the joint farm-group, and almost nullified in the townships by subdivision and squatting.

175 A year before the potato famine of 1845, a new landlord
178 had brought good-will, capital and pioneering effort to
433 Lewis. These had been directed to experiments in the reclamation and the industrial utilisation of deep peat.
[427] Helped by employment on these and other works, the
• [311] population of Lewis continued to increase, when increase in Harris was arrested for a generation. Yet while neither
[161] experiment with peat met with success, little aid had been given to develop fisheries. In both parts of the Island a growing population was supported from the 'seventies onwards by help of earnings derived from the seasonal herring fishing on the East Coast and from inshore line fishing at home. Women added to the Island income by seasonal 'gutting' and, in Harris, by their spinning and
[167] weaving. Money was earned by work on the mainland,

114 reports of early speeches by Leverhulme, Professor Patrick
185 Geddes had quickly come to feel that his old acquaintance,
473 Leverhulme the industrialist, might have overlooked such
433 agricultural potentialities as existed, and that he had quite overlooked the social significance of land. Hence, in May or June 1919, Geddes proposed that a survey be made by one who knew the Highlands botanically, who was experienced in agriculture, and who had some knowledge of Highlanders at home and of sociological factors. Geddes
[123] suggested Dr. M. E. Hardy for the task. Leverhulme forthwith accepted the suggestion and commissioned Hardy, whom the present writer assisted on the Island.

• 311 Examination of the farms, so hotly debated, showed that they possessed little or no initial superiority over neighbouring crofting settlements. That the farms were placed in the best coastal tracts for agriculture is true, but their shores are at the same time the poorest in harbours and fishing facilities. As a result, the crofters dwelling near the farms along parts of the same machars and smooth slopes were 'crofters' who sometimes fished, rather than fishermen with a house-site and a potato patch. As Hardy wrote (in his MS. Report): "The chief superiority of the farms resulted from levelling, drainage and enclosure" by landlord and farmer, sixty or seventy years before. The improved land both of farms and adjacent crofts was reclaimed from peat and machar, or from an admixture of both. "How then", asked Hardy, "did so much value
[423] come to be attached to the farms? The traditional grievance (of eviction) led neighbouring crofters to turn their eyes towards the green patches of the abandoned villages and endowed the old land with special virtues. After the Crofters' agitation of the 'eighties, successive Boards came with their eyes already focused on the farms, by the

3: Geddes K-4, 3 (1919-1952) 1955 ES10 Highland Scots
Lewis and Harris

137 there is frequently found the most thriving of the vege-
311] tation types of Lewis and the best grazing ground. It
233] includes grasses such as those already named, together with purple *Molinea*, meadow soft grass (*Holcus*), and mat grass (*Nardus*); sedges (*Scirpus* and *Carex* spp.); with the field wood rush (*Luzula*) and a fair number of flowering plants. Heather is common in this and the following community (3).

With true 'hill' pastures, found especially to the east of the Forest of Harris and between Loch Seaforth and Loch Shell, are included fair pastures with good grasses on the rocky hillocks near the villages around Loch Roag and also on the low, steep hills northward to Shawbost.
34] The 'skinned land' lies in strips too narrow to be shown on the map, but may form a ring of desolation round the village. The hard moor-pan resists natural seeding of plants unless broken by the pick, but broadcasting of a cheap seed-mixture with a little fertiliser can work marked improvement.

(3) *Marshy Grass Moors.*—Where the slopes are gentle, and the acid humus has accumulated to form peat, is found coarse, tussocky, damp pasture, of sedges and grasses, grading from the 'fair' and 'hill pastures' to the beginnings of hummocky peat hags and smooth sedge moss. It covers the slopes of hills such as Ben Barvas and Muirnag and the hillocks that emerge from the great central trough of brown peat moor. It also characterises the low but broken areas in southern Lewis. This type forms a belt below the 'hill' and 'rocky' pastures of Harris. At its best its prevailing hue is olive-green turning to a silvery shade and then to russet later on. Annuals are few and the grasses are coarse.

33] (4) *Peat Moors, Mosses and Peat Hags.*—The most

137 widespread plant community in Lewis is undoubtedly the
[133] *sedge and cotton grass moors* (or ' mosses ' as they would be called in the Lowlands), which overlie deep peat generally at low levels, on flat or slightly rolling grounds. The peaty floor is waterlogged and boggy, and the carpet rises into tufts, dense cushions or mops, out of which bristle innumerable stalks, thread-shaped, sheathed, fibrous and elastic. There are few flowers apart from the bog asphodel, while heather does not thrive but is stunted. On the slopes, sedges (*Scirpus* and *Carex* spp.) and cotton grass (*Eriophorum angustifolium*) dominate, and in the hollows, sphagnum moss. Owing to slope and consequent erosion, the surface may break into hags (or ' bruachs '), separated by deep and more or less broad channels of bare peat with puddles.

[311] For reclamation by tractor and peat plough, smoothness is essential, combined with some slope for drainage. From observation of the fragments of poor pasture topping the hags in channelled eroded peat, it can be noted that drainage alone is not enough to create good pasture, though it
[241] is the first step. In order to complement the work of drainage, fertilisers must be applied to encourage plants which absorb water in quantity and transpire it freely in the course of rapid growth. For it may be said that plants like heather—adapted to withstand drought, physical or ' physiological '—do not transpire water in any great quantity. Thus they fail to ' drain the ground from above ', as juicier grasses or fodder plants do by the vigorous ascent, transpiration and renewed absorption of water.

[134] (5) *Heather Moor.*—The common heather (*Calluna*) dominates on many steep slopes and rocky bluffs, sometimes on acid humus, or again on decomposed rock and screes, generally at low levels. Among the chief plants

by reclamation, notably at the Macaulay Demonstration Farm on the 'peat moss' of Arnish Moor (south of Stornoway), then too small to be shown, and in South-west Harris where new crofts were laid out in the thirties.

The six main types of vegetation in the Island may be grouped as three. First are the Hill Pastures and Moors: (1) 'Rocky' among the bare hill-tops of Harris and Uig, and (2) 'Fair' on favourable slopes, which merge into (3) 'Marshy Grass Moors' of coarse grass and sedges, heath and rushes. Secondly come (4) the vast brown 'Peat Mosses and Moors', either smooth and wet, with sedge and cotton grass, or channelled and cut up into hags; near the broken edges of the island cliffs this expanse is often fringed by (5) the 'Heather Moor'. Thirdly, by the sandy bays, are (6) the 'Machar lands', *i.e.* the 'Sandy Pastures', rich with clover; though narrow, this coastal plain is all important to stock-rearing and potato-growing, and so to settlement. In traditional terms, these three groups form hill moor, peat moss and sandy shores: *monadh*, *mòine* and *machair*.

(c) CROFTING AND THE CROFTERS' YEAR

1. *Place of Settlement and Choice of Work—Past and Present*

Lewis and 'Harrey', as they were called four centuries ago, were well described by Dean Monro,[1] and his description is fundamental to the present scene. "Harrey is very fertile and fruitful for corne, store and fishing, twice mair of delving is in or of teilling", which appears to mean

[1] Dean Monro, *The Western Islands of Scotland . . . in 1549*, reprinted by A. Mackay, Stirling, 1934.

that the spade and foot-plough (*cas chrom*) were used for double the area ploughed. From Monro and from the precise Statistical Accounts of the eighteenth century, it is clear that pony-drawn ploughs were usual in the smoother parts of Lewis. In North Harris are 'abundance of Deir'. We must not forget here that 'faire' and fertile are comparative terms for the West. "Lewis is faire and weill inhabit at the coste, ane fertile and fruitful countrey, for the maist part beire [barley], with 4 Paroche Kirkes." There is "ane castell callit Stornoway . . . with 3 salt loches, very fine for take of herrings . . . [and] infinite fresh water loches. In the Lewis there are 8 waters with take of salmont. . . ." There were also "Whales . . ." In "a cove 2 fadoms deep at the ebb sea, uses Whytuns (whitings) to be slain with huiks", there were "very many haddocks and Men with their wandes sitting [as today] upon the Craiges of that cove, and Lades [boys] and Women also. . . . In this Ile there are many Sheip for it is very guid for the same. For they lay furth ever one mures and glens and never enters in a house and their wool is bot anes in the zeire pluckit off them in some fauldes." In Zetland wool is still plucked, not sheared.

The description of reclamation is specially worthy of note: "In this countrey all is peit mossland at the Sea cost, and the plaice where he wins his peitts this zeire [year] . . . there he sawes his corne the nixt zeire, after that he guidds it weill with Sea ware" [*i.e.*, improves or manures it with seaweed]. On "Ellan Colm Cill [an islet apparently on the east coast south of Stornoway at the mouth of Loch Erisort] Macloyd of the Lewis has ane faire Orchard, and he that is Gardener has that Ile [rent] free. . . ."

Around the coast of Lewis no absolute limit is set to

ich Dean Monro has described as he saw it. economic return must be balanced against nature. Although natural conditions are nay not form a complete explanation of the of reclamation in the nineteenth century; tion from the agricultural advances of the arriers of mountain and sea caused the re- rogressive methods until the wave of agri- vement had spent itself by the middle of To this cause must be added other influences ose leading to peasant advance in the rest of pe: the political history of the Gaeldom revolution in land tenure and in the social per classes, the commercial, industrial and opment of Great Britain. All these factors the contrast offered to the Lews by western western Norway, lands in which the soil re comparable to those of the Island. Yet proceeding, as on skinned land at Ness, f ground have been steadily broken in by ade or plough.

and agricultural land are placed around h their fishing grounds. In spite of what —that the Lewisman is and has always been isherman—fishing alone is not enough to is distribution, for the agricultural conditions are also best along the coasts, or were so for As Stevens remarked, the light sandy ds are there, and the fringe of partially im- lose by; drainage is, on the whole, better, nd and sea-ware are to be had for manure. also serves still as fodder, while one or two etimes cooked for human food; carragheen

241 thirds of an area nominally under crops actually grows them. It need hardly be said that such crofts do not support a family.

The means of cultivation have been either pony-drawn ploughs in the smoother north, or else the foot-plough [407] (*cas chrom*), and the straight spade in the hilly south. I saw the almost obsolete foot-plough used on hilly ground near Rodel, Harris, in 1919. In the smoother lands from Stornoway and Barvas northward, however, the crofts then were already laid out in parallel strips, no more than twelve to fifteen feet wide, divided by open drains. Open drains have increasingly been converted into underground drains over which pony and plough can pass. The cattle feed on the rough pasture or on the grass about the crofts, supplemented by hay cut with a sickle from the grassy edges of the 'lazy-beds'. Quite recently, rotation grass has been [178] sown on the arable strips, and mown for hay by the scythe. [407] Tractors were introduced in war-time, in 1942.

In many of the villages, cattle are still taken to the 233 summer pastures out on the moors some miles from the 221 crofts. Those who herd the cattle live in huts or shiel- • 311 ings, annually re-roofed. In the congested 'Point district' (the Eye Peninsula), the cattle must go to the moor on the main island or be taken on to their owners' crofts from late May or early June to about the 10th of August, in order to clear the common grazing and allow the grass to recover. This migration takes place, of course, because 233 of the restricted area of common pasture. On the other 311 hand, pasture is plentiful in the parish of Lochs, lying all round some of the villages, and here the use of the shieling has been practically abandoned. In almost all villages, with the exception of those of the Eye Peninsula, there is less summer pasturing than formerly; fewer cattle are sent

233 away, and for a shorter period. The sheep wander over • 311 the moors all the year round, though they hang about the crofts when the winter is severe.

221 A comparison with mountainous Norway or the Alps 132 and their high summer pastures suggests itself; but in 171 Lewis altitude is almost negligible, and the shielings may lie only two to five hundred feet above that of the crofts [133] beside the shore. The difference between winter and [311] summer is in any case less, snow being rare and the conditions being such that even in summer the shieling pasture remains poor. Hence it is that while modern Norse and Alpine economy still maintain the summer pasture, the shielings have died out in the Highlands and are slowly decaying in Lewis. Seasonally, stock are transported over longer distances, from Highland to Lowland pastures.

181 Reasons for the continuance of these and other crofting [178] ways, or for their abandonment, are not of an economic [461] order alone: not only the remuneration received for labour, but the feeling for the work counts enormously. Visiting a couple of distant shielings in the summer of 1919, I found that two lads newly home from the Navy had come up from their village 'for a holiday', bringing rods for trout-fishing and high spirits for play. By day they fished or flirted. By night they slept in one of the two shielings, while the two laughing lasses they had come to visit shared the none too wide couch of the other shieling with the two older women there. One of these was a matron with a motherly twinkle in her eye, the other was a spinster in whose eyes there shone a memorably vivid light; she was the sister (as I found later) of a noted minister on the mainland. The bare simplicity of shieling life is traditionally softened by fellowship and a gaiety that is not beyond [538] control. A Lowland poet once coined a famous phrase,

137
134

blows away, no doubt because the humus rots and quite fails to bind the sand. These two types together form the true machar.

(*c*) From the machar rise the slopes of drift-covered rock which bear a top dressing of blown shell fragments, more or less mixed with the soil by treading and cultivation, and imperceptibly giving place to the undiluted 'black soils' of moor and croft with their corresponding vegetation or crops. The shell-sand is often blown onto the rough pastures high above a bay.

Where a portion of the true machar has been cultivated it is allowed to seed itself. A sprinkling of weeds is followed by the re-establishment of a mixed flora. In both the sand and the consolidated sand-covered drift grow wild white clover and vetches; and among the grasses are rye grass (*Lolium*), Yorkshire fog (*Holcus*), cat's-tail (*Phleum*) and meadow grass (*Poa*). Other plants include familiar weeds and wild-flowers like yarrow, cow-parsnip, golden rod (*Solidago*), silverweed, wild carrot, thyme, plantain, sorrel, yellow rattle, harebell, eyebright, pansy and many more. Arrival from the bare brown moorland to the sand-blown slopes or dells is made a pleasure by stream-side flowers like meadow-sweet.

137
311

Woods and Cultivation.—In addition to the woods indicated on the map, in Stornoway Castle policies, shelter-belts or plantations occur at certain lodges. Cultivation, as will be explained in the section on crofting, is rarely continuous; and the map shows areas as cultivated which are far from being either continuous crop land or
[185] even permanent grass of the first quality. Yet since this map was drawn the improved area has been extended somewhat

i [see map on p.50--analyst]

"the lone shieling of the misty island". Traditional Gaelic songs tell rather of shielings grouped within hail, with their sweethearting and good cheer!

3. *Crops and Stock*, circa *1938*

As the thirties mark a transition between early conditions prevailing until 1919 and those of 1947–53 (Appendix I), the present tense is used.

Of the Island's 528,000 acres, including deer forests on the Harris border partly grazed, there are 24,000 acres of arable and grass land. Barvas parish leads with 6500 acres, then come Stornoway, Uig and Lochs, Harris being last with 3300 acres. Roughly one-third of the Island's arable and grass land, or 32 per cent, is permanent grass, chiefly machar, with a maximum of 39 per cent in Uig, but a minimum of 9 per cent in rocky Lochs, most of this on one small farm. About 10 per cent of the arable and grass land area is given to hay production; of this, rather less than one-third is rotation hay grown on the plough rigs or parks, and rather more than two-thirds is hay from permanent grass. Lochs, lacking machar, has 20 per cent hay, while Barvas, better off for machar, has only 4 per cent. Even this proportion of rotation hay shows an increase on the crofts since 1919. Stornoway parish, it will be noted, occupies an intermediate place, but if the facts for Point (Eye) district were contrasted with those for the villages along the machar, the differences between them would emerge clearly. As it is, they can be guessed from the vegetation map showing the machar. Oats is the chief crop, and occupies 33 per cent or just one-third of the arable and grass of the Island; excluding the permanent grass, it constitutes half the crop.

In Lochs it occupies only one-quarter of arable and grass. Barley, mostly four-row, or bere, is less important as a food today than formerly, and now occupies only 6 per cent, and, though it reaches 13 per cent in Barvas, with its machar, hardly any is grown in Lochs. Rye (*seagal*), still found in the machars of the Uists, is little grown in the Lews. Potatoes grow well everywhere, occupying about 15 per cent of the area, though townships with plentiful machar land grow most. Turnips are being gradually introduced, and though their liability to disease has somewhat discouraged the crofters, the proportion is now about 2·3 per cent. Cabbages occupy a small area (1 per cent), latterly along with lettuces, carrots and the like.

Rotation hay and turnips being almost unused up to 1919, oats was grown repeatedly before rotation with barley or potatoes, and with no bare fallow. While heavy manuring maintained the fertility, the crop by July was ablaze with corn marigold (and other weeds) through which the thin oats struggled to rear its head. Thickly sown, the return was exceedingly small. Except for the machar (if any) there was no 'out-field' as elsewhere in old Scotland.

The smallness of the crofts and the poorness of the crops explain the very small total return. Hence little oats is now ground for meal and the potatoes do not last through the year, though few are sold. The low out-turn also explains why even fodder is scarce, though much more of the crop is secured for wintering than formerly. Summing up, a croft of 6 acres—though a little too large to be quite typical—includes a couple of acres of grass and hay, almost as much of oats, and the remainder bears potatoes and barley, with turnips, cabbages and garden produce.

In the past, the cropped land was unfenced and unwalled. At present, the rule is to encourage the con-

311 indication of their worth. As above, the period is *c.* 1937–
511 1938. The Island's increased sheep stock is shown in Appendix II (ii) (a) to 1953.

[233] The Lewis and Harris pastures carry on an average about one ewe to 9 or 10 acres, that is, one ewe or lamb to 4 acres in June (the month of the agricultural returns). A good mainland grazing like Glen Shiel carries one ewe to 6 acres, while poorer grazings like Kintail and Farr carry one ewe to 10 or 14 acres respectively. Nowhere, however, can the rough grazing support the newly weaned ewe lambs (or hoggs) throughout the winter, which have either to be brought to the enclosed 'low ground' (of which there is never enough to supply both grass and winter feed) or sent to the Lowlands in autumn and brought back in spring, at a total cost of about 10s. each before 1939. In Lewis, for lack of grass, there is considerable loss in winter among the crofters' sheep. Constructive measures for the future must be based on an increased supply of winter feed.

137 The game consist of red deer, grouse and hares, while
511 salmon and trout are fished in stream and loch. The deer range over Harris, Park and the Uig hills, but are seldom seen north of Achmore. They are of ordinary quality and size, and before 1939 the average number of heads for the year totalled about 190 stags and 80 hinds. It is not known
[529] when they were introduced. In the south there may be a certain amount of 'deer stealing', as in most deer forests surrounded by crofts, in spite of a score of keepers and deer-stalkers, and other employees at shooting lodges. Grouse are relatively scarce compared with those on drier
[825] mainland moors. Mountain hares have multiplied since their introduction in 1853, when, it is said, the first hare, seen near a village towards evening with its white winter coat, was thought to be supernatural.

361 luck in land, but a disadvantage where control of a single
[423] area is desired by one man. Regularisation of roads,
[182] houses and holdings is relatively modern, for crofts and dwellings were once grouped in hamlets usually close to
[172] the seashore. The early hamlets can still be made out from their ruins among the rocks, sometimes sketched in the 'six inch to mile' Ordnance Survey plans. They were without formal order or arrangement, each homestead within its boundary wall. Where ploughing was and is too difficult, the soil is heaped up in ridges, 'lazy-beds', and dug.

361 Shawbost, on a rocky part of the west coast (six miles
491 south of Barvas) consists of three main sections: a scatter of houses and ruins by the enclosed loch, two main streets linking the loch to the main coastal road, and inland another short street. The three can be made out on a 'quarter-
[175] inch' map. The two main streets were laid out by the
[311] Estate Officers following removals in the mid-nineteenth century from another part of the island, Uig, and the third running inland was laid out still later, when population was growing and land was needed. When the third street was laid out, the landlord, Matheson, lent good plough-horses for preliminary reclamation. The irregularly placed black houses near the sea are tending to be rebuilt close to the main road.

361 In addition to this type of movement, farms 'broken
178 up' once more into crofts have been laid out on a regular
311 grid plan, each house placed on a corner of its five, ten, or twenty-acre plot (*e.g.* Galson, Dalebeg, etc.). 'Skinned'
[654] land may also be reclaimed for crofts by squatters tolerated by the community, or on a regular grid by agreement of the assembled crofters, guided by the Department of Agri-
[491] culture. Thus two distinct tendencies are seen: the grid plan in new settlements, road alinement in existing ones.

present writer) came to the Island in August 1919, and still more by November 1919 when Hardy's Report had been completed. Leverhulme had begun to fight for his plan, rather than use it in a supple way. Yet there was still a chance to put things right had the concept of a balanced community been clearly visualised by Government and people, by working fishers and crofters and the educated. Had an active 'Lewis Association' existed at that time, it might have turned the scales.[1]

Lastly, during the war and after it, Leverhulme had said, again and again, that it was his admiration of the people which had called him to the Lews. By means of this 'all-round' plan, the very root of Island character could have been renewed, namely, communal life. It was with their communal life in mind that Hardy—in spite of his horror of bad husbandry and of the physical dirt of the byre and black house—wrote, first, that "rural re-

[1] Quotations from the MS. Report having been published (apparently without permission, and with somewhat misleading criticisms), reference should be made to these to illustrate the need for survey and collaboration with Leverhulme in the first three years of his proprietorship, and the importance of survey for action today. In 1919 Mr. W. C. Mackenzie (to whose historical researches lovers of Lewis owe so much) had published his belief that "Under the new proprietorship . . . the results [of development] will be at once fruitful and far-reaching", without his making any constructive comment. By 1932 he wrote very differently, criticising Leverhulme's policy and also Hardy's (qualified) approval. At that later time, Mr. Mackenzie would have it that 'the Lewisman' was a crofter and fisherman in one, and that for him to become 'mainly a fisherman' or 'mainly a crofter' (in Hardy's words) would be false to his character and tradition. Now, historically, the element of regional specialisation is ancient in the Island; the crofter-*fishers* of Lochs, Uig or 'the Bays' of Harris have long been rather different from the fisher-*crofters* of Barvas, or of Coll and Gress. Specialisation was strongly marked by 1914–19; it still is. Further, Hardy (and the present writer) had not pled for complete divorce of the two vocations of sea and land. We urged that crofting be given its chance as well as fishing; and that the two callings should be complementary. Allowance being made for a quarter of a century of changes, the facts and the need remain. Cf. W. C. Mackenzie, 1919 (p. 187) and 1932, for the quotations given.

construction of the Island must rest upon the improvement of the land": and secondly, that by this means "it was imperative to revive the traditional community spirit, the essential feature of Hebridean civilisation". Those words still hold good. Yet the land itself is too barren and the soil too poor to provide a living for many by export of fresh agricultural produce to the mainland. Only a local market could pay a fair price for most of the products of intensive small-holding. Judging from the free, untrammelled trade before 1914, Leverhulme held that fishing could be set upon a commercial basis in the Isles; and there could be few better judges of commercial possibilities than this keen industrial thinker and organiser. If he was right, as surely he was, to begin with, then the local market to be created, or rather enlarged by growth of population and prosperity at Stornoway, could have purchased the fresh milk and eggs, the fresh greens and fruit, raised on enlarged small-holdings and marketed co-operatively.

A final comment remains to be made. The community spirit of Scots fishers from Berwickshire to Barra has gone far to make co-operation among the men of the crews a living thing. 'Work for Wages' offered little outlet for this, indeed it virtually suppressed it; and 'co-partnership' on the Port Sunlight model was a very different matter from the co-partnership of a crew. Even if at that time it had been proved impossible to organise free co-operation in fishing, co-operation in small-holding townships might have kept the communal spirit alive, for later renewal at sea.

It is not easy to assess the after-effects of Leverhulme's activity. Leverhulme certainly helped hundreds of families by the provision of wages for the building or rebuilding of roads and other works, of which some were completed

623 The Trustees of the Stornoway Trust have not found
423 it easy to meet the cost of keeping up the valuable property
427 of the Castle and Park, nor to carry the burden of its rates,
178 no adequate income being available for the purpose.
874 Today, however, Leverhulme's gift is being put to good use as a Technical College, opened in September 1952.

• 311 Division of the available farms, after providing about 200 small crofts (of ten acres or so), still left the problem
427 of finding legal homes on legal tenure for the remaining
362 cottars and squatters.[1] The Department of Agriculture
656 arranged to feu plots of 'skinned land' on the outrun of certain townships, including one in the extreme north and others in Lochs. About 200 of these little holdings with potato ground were provided. On the holders' behalf the Department feued land from the owner, after obtaining the consent of the Common Grazings Committee of the township and permission from the Land Court for 'resumption', *i.e.* for enclosure of a portion of the common. The legal and administrative procedure involved may seem disproportionate to the economic value of the holdings. Yet difficulties of law and custom had been allowed to go from bad to worse during the past eighty years; and these difficulties were overcome.

362 To encourage better housing in the crofting counties,
652 loans are made to 'crofters and fishermen feuars' person-
[342] ally. Local stone, or latterly concrete, is used, and much of the building is done by the 'man of the house' himself, and his friends. From 1920 to 1940, nearly 1200 loans were made in Lewis and Harris for the erection (or improvement) of houses, and in a few cases for the erection

[162] [1] Estimated at 1200 to 1500 shortly before, the open question was whether subdivision during the previous eighty years was to be recognised and accepted.

362 of new steadings. The average amount of loans (totalling
652 £166,000) was under £150; repayment has been satisfactory, and the arrangements made by the Department of Agriculture won general praise among the people. Yet 1200 houses were very far from replacing all the 'black houses', and many more are needed.

433 In terms of cash profit, ten crofters today run their
427 crofts less remuneratively than the farmer they dispos-
241 sessed; even together they may show little more total production than the farmer. Nevertheless, these ten crofts each allow a part, at least, of the basis for a country home.
[423] Hence the weight of public opinion supported, nay, insisted
654 on 'giving back' the land to the descendants of those who had worked it sixty or a hundred years before. The State
423 bought the farm stock at a high valuation, and till lately without adequate reform of crofting use and wont. The farms having now been divided, a great emotional issue, which had smouldered for half a century, has been brought to an end. Although the practical results are small, the crofters feel that justice has been done, and that fact may
• 311 be a great gain. Now that there is no more green reclaimed land to be had, the reclamation of the peat moor, or the grey 'skinned' boulder clay has to be faced.

By financing the renewal of Leverhulme's brief attempt to reclaim deep peat on Arnish Moor, south of Stornoway, the Canadian, T. B. Macaulay, made a resolute attempt to
[241] solve the island's main agricultural problem. Good crops were grown, potatoes and silage produced, and a dairy farm established. But the difficulties called for continuity of effort and research. From the practical point of view of 'demonstration' it had been a mistake to tackle deep and almost level peat, black in colour and viscous in consistency.
[487] There was not the light machinery required for cultivation.

3: Geddes K-4,5 (1919-1952) 1955 ES10 Highland Scots

311 cottars' claims." Thus a few of the settlements reclaimed
123 out of the common peat by some scores of people, hundreds of years ago, long worked by joint tenants, then by sub-tenants, " and later turned into modern farms, came to be regarded as the only available land open to crofters in the Island ".

311 Hence, Hardy concluded, it was important to tackle
433 some reclamation of peat or of land partially covered by peat, along with the development of the main commercial industry, fishing. The specialisation of commercial fishing was " a wise, indeed an indispensable preliminary step " in a constructive policy framed to deal with the Island as a whole. One saw that the formula " All Lewismen are fishermen " was an exaggeration, and that some of those whose forebears had dwelt by the machars of Broad Bay for centuries were landsmen first and seamen
185 second. Yet the specialisation planned by Leverhulme
311 would not only have given a chance to the seamen of Ness, Eye Peninsula, Lochs and 'the Bays' of South Harris;
133 it would also have begun to relieve congestion, giving a croft and outrun to some of those who wished to make small-holding their principal means of livelihood and life, and providing a market for fresh produce on the Island itself.

Looking back, it seems clear that Hardy was right to report to Leverhulme (in 1919) that, while the great fishery scheme was indispensable, it should be complemented by a scheme for occupation on the land for those who wished it. The major problem of land being the amelioration of peat, continued Hardy, it should be tackled with twentieth-century knowledge and equipment. Slopes were to be found, favourable to reclamation, where peat had been thinned by cutting, where it was shallow from good drain-
33 age, or lighter in texture from admixture with sand. Had

311 womenfolk might wish to keep poultry, and even a cow.
[114] More than this . . . might tend to make the old amphibious life begin over again." Where Hardy went further was to see the need for a complementary policy; the development of crofting into skilled small-holding. "Similarly," he went on, "the development of small-holding, by one who chose the land for a career, should not prevent his spending a leisure hour fishing from the shore, or in a neighbour's boat, for haddock, saithe, or flounders for the morrow's dinner. Yet the wish and need for a higher standard of living involved new emphasis on one chosen vocation, and a greater division of labour than heretofore,"
311 whether on land or sea. Some division of callings already existed, be it remembered. Manifestly, in the virtual absence of arable land for them, about 1500 cottar and squatter families had perforce to depend mainly on other occupations than the land. These families included the keenest, most successful, and potentially prosperous fishermen, like those of 'congested' Scalpay (off Tarbert, Harris). The useful "Remarks" formerly published along with the "Creek Statistics" of the Fishery Board, repeatedly contrasted the townships and creeks mainly concerned in crofting with those mainly occupied in fishing. The contrast is to be found from the Shetlands round to
[159] Barra or Kintyre. Leverhulme, seeing a future in the
[433] fisheries, tried to give the almost landless seamen their chance at sea. Had he accepted the complementary policy of giving a number of the now boatless crofters a better croft and means to improve the outrun, his schemes would have been complete.

114 It is a misfortune that Leverhulme's one-sided policy
159 had already hardened in his mind when Hardy (and the

And when laid down in permanent grass for the dairy herd, the land became water-logged in wet weather. The war called a halt to progress; and though much was learned, the farm was not a demonstration of success. Smaller experiments were made, with some success, in improving 'skinned' land. For both types of land, the cost of fertilisers, even more than of labour, was the chief economic difficulty.[1]

A difficulty which aggravates 'congestion' in crofting townships is that even a small croft may consist of several plots. This was only too well illustrated, as late as 1935, by the dilemma in which a crofter found himself, in a township north of Stornoway. This crofter's land was in at least five separate strips, mixed up with the land of four neighbours. The township and the plan of the holding are known to me. As the crofter complained, he could not walk round his present cottage, nor bring building materials for a new house to the site, without trespassing. He could not even put up scaffolding because the stays at each end would project on to the holdings of his neighbours, who objected. The Land Court has power to re-allocate the land in self-contained holdings. This crofter had twice asked for this to be done, but on each occasion neighbours opposed the application, and it was not granted. As he could not replace his present house by a modern one, he applied to the Stornoway Estate Trustees for another croft in a neighbouring township. When the Trustees saw a plan of the holding they described it as a jig-saw puzzle; but having no holding to offer him elsewhere, they could only ask the Factor to try to make an amicable arrangement with the man's neighbours. This case is extreme; yet it

[1] W. G. Ogg and Angus Macleod, *Scottish Journal of Agriculture*, 1930–36.

311 241 illustrates the narrow margin of habitability on these fragmented holdings.

423 Now, in Lewis periodic pooling and exchange, or the practice of *movable* run-rig on the small joint-tenants' 241 farms, was abolished early in the nineteenth century, except 423 upon the machar, where it still continues. Apparently the 476 strips were simply fixed where they had last been apportioned by lot. Subdivision of the little crofts among sons 178 and grandsons followed, owing to inheritance without re- [175] clamation. Fairness gave 'the patchwork quilt' described; but it was fairness pushed to the point of folly, for differences in soil from one adjacent strip to another were slight! It is otherwise with the long, narrow plough-strips which run from the houses on the pure boulder clay down to the sandy shore: run-rig, movable or fixed, is understandable and necessary there. The case just cited shows how a sensible communal tradition, such as that of '*movable* run-rig' with periodic pooling, may degenerate into absurdity by fixation. Happily the machar still shows the sane maintenance of a tradition, the pooling of resources:[1]

182 In 1924–25, widespread distress in the Isles, the failure 161 of the Leverhulme endeavour, the crofters' refusal to own their own crofts, and the emigration which followed, caused many outsiders to forecast rapid depopulation. It was all 182 the more interesting to note the confidence in the Island's 161 future shown by buyers of the great estate, all of whom 471 knew what they were about, for they were men with experience of the Island, of its rates and rentals and of its people. To a wealthy man who repurchased a sporting

[113] [1] Apportionment of lands held in run-rig in the Carloway estate is described, and the principle discussed, in *Scottish Land Court Reports*. (See *Scottish Law Rev.* vol. 28, 7; July 1940, pp. 51-54.) At the same time 'mechanisation', or the co-operative utilisation of tractors had led to pleas for 'collective farming'. (*Stornoway Gazette*, February 1944.)

458 problem remains that Island seamen may thus continue 746 indefinitely to be crofters receiving partial relief, seamen only in name. Without doubt, part-time work on a croft is socially a lesser evil than prolonged unemployment in a slum or semi-slum. The crofter's family, too, is relatively better reared than that of many a poor seaman in Glasgow, Liverpool or Cardiff. Yet if this were all, it would be no adequate life for a man, while continuing to be an expense [461] to the State. The more satisfactory side of such relief is [311] that the Islanders, when unemployed, turn to building new 'white houses', and either to making small improvements on their crofts, or as in Ness (a progressive village with a high proportion of seamen), to the reclamation of new holdings on 'skinned land'. In all such cases a means test provides against full payment to those who could do without.

458 To women normally employed in 'gutting', unem- 746 ployment relief is given only at such time as there is no work during the season when it might be expected, *i.e.* 462 from May or June to December. Gutters from the Island [228] are busiest for the months from June to August on the West and East Coast of Scotland, and again for two months, from October to November, in East Anglia. The number of Lewis women normally employed was over 1500 in a typical season (1930), the earnings averaging £19 each for the summer fishing in Stornoway, and as much again for the gutting in East Anglia. But the demand fell, and by 1932, for instance, some 250 women were obtaining relief, through Stornoway, in early August, the number doubling during the slack months from mid-August.

181 The tragedy and the danger of any means test are that 458 in effect it asks, not "How prosperous can you become 746 if given help?" but "How poor can you become to qualify

458 How then can the situation be assesse 178 the outbreak of war and since then? By had been partly lost; for the after-war ye hulme boom' were followed by dis poverty. CHAPTER XI

CONCLUSION

ISLAND, REGION AND NATION. REGIONAL SURVEY FOR COMMUNAL SERVICE IN 'THE NORTH AND WEST'

121 THE aim of this study has been the survey of a region for the service of its society. Survey is fundamental. As treatment should follow diagnosis, so should decision for action be based on balanced knowledge. Until now this has too seldom been the case. In Scotland particularly our land and resources are as yet imperfectly surveyed; our activities are still too haphazard and chaotic. There is work to be done and there are hands to do it, but they have been kept unemployed; the workless slackened in body and mind, and their spirits failed; and our communities are still without clear aims in common. The first five years of peace have seen an increased awakening to integrated planning. Planning must be preceded by survey and be linked to international order; it must be aimed towards better living and finer purpose. This study is part of a world-wide movement of survey and planning directed, not first to private gain but to common ends. In Western Europe until the war, in the United States and (in a different way) in the war-ravaged Soviet Union, men and women of good-will have striven to prepare for a ' New Deal ', region by region.

APPENDIX I

434 369 The significant figure here is the average total payment per head in the rural or ' landward ' area, a sum of ten pounds sterling, the complexity of urban conditions, even in a small town, making the total for the Burgh less significant. To put it differently, an average rural household of 4·5 persons thus received a sum of £45 a year from these sources.

All these figures—pointers to the complete facts, unascertained as yet—show that even with the help of these sources the average income of the rural Islanders was small. Comparisons of such figures with those for the rest of Britain would, of course, be misleading. To those who spend their working lives outside their native isle, Lewis is no more than a home; and for them it should therefore be compared to some urban suburb or ' dormitory ', rather than to an urban centre of production or a typical agricultural district in the Lowlands.

434 171 178 It may help to compare the conditions of 1938 with those of 1951 if, say, average weekly wage earnings for all British workers in employment are taken for October of both years. Thus, taking the 1938 earnings of 53s. 3d. as 100, those of 1951 were 141s. 1d. or 265 per cent of the first, a figure to be related to the cost of living index which had only risen from 100 to 202 per cent. The total wage-bill gave a still higher increase for Britain, from 100 in 1938 to 287 per cent in 1951. As food forms a heavy part of the doubled cost of living to people in poverty or near it, the crofters' own food does not greatly relieve them. The loss of employment following the close of the mills left little for them but to seek employment beyond the Island.

434 311 Summing up the facts of this Appendix, it may be said that the Island furnishes (1) means for partial subsistence for most; (2) means of earning a livelihood, for some; and (3) a home from which many go forth to earn a living for themselves (and their families) elsewhere—meantime contributing to national and local income there. Of these, many return later, either to found a home, to pay visits on holiday or during periods of ill-health or unemployment, or to retire upon the Island.

APPENDIX III

623 for planning preceded by adequate survey became publicly
633 recognised, this crisis seems to have caused a change to con-
433 structive policy on the part of the Trust. It led to the election
361 of a new member of the Trust on a planning platform, and to a general searching of heart and mind in the community.

(184) Meantime the movement for town planning which had spread from the bombed cities to the rest of the country, led to a closer co-ordination of planning aims between the Trust and the Town Council, and there is real hope of progress in collaboration with the County Council as the statutory planning authority.

In brief, the opportunity arose for the Trust to frame a comprehensive policy, one binding together the objects separately listed in the Deed, " to promote the material and social welfare of the community ". The ' material ' provisions of the Deed allow for the promotion of industry—including fishing, of course—of agriculture and afforestation, and of communications by land, sea and air. Medical service is not forgotten. The encouragement of social life and education is foreseen, and bursaries may be provided to enable deserving scholars to proceed to secondary schools and universities.

185 It is felt by far-sighted citizens that these aims should be properly co-ordinated. Development of resources and social life, they feel, could be combined with education and training deliberately designed to equip young people to return to the Island and use their capacities to serve their own community.
(311) Thus among the development schemes which have been mooted are the reclamation of peat, the reclamation of the sandy inlet just north of Stornoway, and local afforestation.
(871) All these technical jobs require training, at the levels of engineer and skilled foreman or working hand. Bursaries might take
(168) the form of education for such rural tasks. The ' export ' of talent may be necessary when no outlet is possible at home, but in the end it can drain away the community's youth. Hence a policy for the return of talent is required. For fishing, for industry and particularly for the weaving arts, training is required in preparation for possible careers at home. Lastly

195 427 [233] 311 [391] 491 [226] The new proprietor was no better placed than Seaforth to change the fundamental causes of recurrent poverty and distress. But at least he had funds to ameliorate his tenants' lot and to allow experiments in land reclamation and industrial development. Existing sheep farms were extended and others formed. Land reclamation went forward hand in hand with industrial experiments such as distillation of paraffin from peat and brick and tile-making. A programme of road building was begun (the first roads beyond Stornoway were begun in 1791, but there were only 45 miles of road by 1836). In Uig the results were very obvious. Further clearances took place particularly from Timsgarry, Carnish (21 tenants), Reef (22 tenants), Garynahine, Dun Carloway. The small tenants of Valtos and Kneep were only saved from eviction by the intervention of the Fisheries Board, [162] for they were important places for white fishing. By the 1850's, although the population of Uig was more than double that in 1755, and 60% greater than in 1800, it was crowded [162] into little more than half the area. Emigration enforced by clearances reduced the population of Bernera and South Uig by nearly 500 between 1851 and 1861.

195 427 311 233 [161] [162] No other part of Lewis saw so many farms; nowhere else did the small tenants suffer so much from eviction. That was not all. Those who remained undisturbed were deprived of some of their traditional grazings and access to the rest was sometimes restricted. Moreover they had to make room for many of the evicted families in their own townships, thereby further increasing the problem of congestion caused by the rapid natural increase of population. Thus, for example, about 1825 there had been 22 families in Valtos and Kneep. By about 1880 there were almost 100. But, during the same period these townships were deprived of their island grazings - Pabay, Vaccay, Floday and Wiay - formerly used for wintering cattle - and of part of their hill grazings (the traditional shielings). Use of the hill-grazings was restricted, too. Thus, for example, only one day was allowed to pull heather for ropes; if men were away fishing or for other reasons, could not attend on that day, they risked punishment by going on any other. Such stories could be multiplied many times.

[103] In the Bernera district, by the 1850's, only Tobson, Bosta and Breaclete (on the island) and Earshader and Crulivig (on the mainland) were left for the crofter families. Moreover their traditional summer grazings, which lay south east of the Deer Forest which was formed out of the Scaliscro sheep farm about 1850. Apparently their use of the old shielings was tolerated until 1878, after which date they were directed to the area north of the present road and which they have continued to use until the present day. Thus the shieling huts shown in fig.5 all post-date 1878; the area in which they lie may have been part of the West Earshader tacksman's holding. The date of discontinuance of that tack is not known but the house, now empty, was for long occupied by squatters and the old lazy beds around it still form part of a large squatter holding.

It is noteworthy that almost all the clearances were in the Bernera and South Uig districts and this is reflected in population changes between 1841 and 1851, shown in table 4.

The cleared areas included extensive hill and mountain grazings and some of the best wintering ground, including all the machairs except Valtos and Kneep. The East Loch Roag and Carloway districts were less attractive to the new farmers; as is so commonly the case in Lewis, their rough grazings lay on gently sloping low plateaux and were consequently ill-drained and of poor quality. About 1852 Dun Carloway was let as a tack but was never successfully farmed and was soon returned to crofter-occupation; it may never have been wholly cleared of crofters. Garynahine, at the southern end of East Loch Roag, next to Linshader, was also turned into a farm about 1852. Here the hill grazing was more extensive and, though seriously reduced by a crofter settlement scheme c. 1936, it remains

195 427 311 a well cultivated small farm, a striking example of what can be done with this unpromising terrain. It is probably true that one of the objects of forming farms was to introduce improved methods and so set an example to the small tenants. The contrast, today, between Garynahine Farm and the nearby crofts, suggests that more than example is required.

TABLE 4

161 POPULATION CHANGES 1841-1851

162 175

District	1841	1851	Change	(%)
Carloway	554	659	+105	(+19)
E. L. Roag	581	717	+136	(+23)
Bernera	670	676	+6(1)	(+1)
L. L. Roag	217	259	+42	(+19)
Valtos etc.	711	484	-227(2)	(-32)
Uig Bay	520	426	-94(3)	(-18)
South	384	348	-36	(-9)

Notes: (1) Viuamore - 46 (-100%). Kirkibost, Linshader, etc. had already been cleared.
(2) Reef -180 (-96%).
(3) Carnish - 60 (-36%) - but completely cleared before 1861.
(Township figures are not available before 1841).

The birth of the crofting landscape.

195 427 311 632 A further mid-nineteenth century attempt to improve the productivity of the small-tenants' holdings was the lotting of runrig lands to form individual crofts. In a report to Seaforth c. 1800, the Rev. Headwick had recommended the abolition of runrig* and some lotting of crofts took place about 1811** - about which time runrig was being abolished in North and South Uist - but many townships in Uig, as elsewhere in Lewis, escaped this lotting. In Bernera, Kirkibost was probably lotted at this time and the crofts fenced; in 1852, despite clearance, the first Ordnance surveyors were able to record the old fences (which were used as the croft divisions when Kirkibost was re-settled in 1878). The now much divided crofts of Kneep (see also fig.22) are probably of the same date. Reef appears, also, to have been lotted early, for the remnants of fences recorded by the Ordnance Surveyors in 1850-1852, (Reef was cleared in 1850), show crofts of the same [621] general form as those of Kirkibost, and quite unlike those of the 1850 lotting. Consequently, in many townships until this date, the houses remained huddled together in tight little groups, often inter-communicating one with another. The groups, or clachans, were usually set in the midst of the arable land. The runrig system had certain disadvantages, but, as a basic agricultural structure for small holders, it had two considerable advantages which may be relevant to modern conditions. Firstly, it was flexible: within it the individual's holdings varied in size and rent and it was possible, at the periodic re-allocation, to adjust the size according to family needs. An elderly person did not need to be burdened with a holding larger than he required, or was able, to cultivate; a young man with a

[113] ** Report.... on the Condition of the Cottar Population of the Lewis. (C.5265), 1888, p.37

* The essence of runrig was that any individual's arable land was in many pieces, scattered promiscuously amongst those of his neighbours. Periodic re-allocation of pieces was usual, but the period varied and in some cases was infrequent.

Figure 6.

Figure 7.

Figures 6 and 7

THE LOTTING OF BREASCLETE

Figure 6 shows the irregular clusters of old houses and patches of arable land (hatched) within the infield dyke. On the right the first of the new houses, standing in a row each on its own 'lot' (or 'croft'), are shown.

Figure 7, from the contemporary Factor's notebook, shows the new crofts as lotted in 1850. Note that these were not fenced.

/p. 14/

175 growing family could increase the size of his holding. Secondly, in the absence of fences
427 a certain discipline of agricultural management had to be maintained; moreover the
proprietor, through the factor, grounds officers and township constables, saw to it that
311 it was. This "good husbandry", albeit at a rather low level, was maintained in the
632 interests of tenants and land-owner alike. After the arable land was lotted permanently to individuals, there was less flixibility and less need for communal management. But the absence of fences between the new lots, or crofts, meant that they were still common land during the winter months. In some cases the proprietors paid the tenants to erect fences round the newly lotted inbye land of the whole township but, even when a ring fence existed, stock was allowed to graze indiscriminately within it from November until April.

It is fortunate that the first Ordnance surveyors were at work in Lewis just as the lotting was coming into effect. The new lots were not divided by fences, therefore they were not marked by the surveyors, but in several townships they arrived in time to plot the clachans and in some - Breasclete, for example (fig. 6) - the first edition six-inch maps show some of the new houses, neatly spaced out on the new lots. The arrangement of the latter is recorded in the Factor's sketch books, of which fig. 7 is an example.

175 Thus whilst we have little evidence of the appearance of the former rural landscape,
632 we have an excellent record of the birth of the new. The characteristic units of the new
178 lotting were townships divided into long narrow strips, arranged parallel and fan-wise more or less in the direction of steepest slope. Such an arrangement was simple to lay out; it tended to give everyone a fair share of the land of each kind - ill-drained and well-drained, high and low. And, if a road or track passed through the township it was usually possible to give each lot or croft direct access to it without the necessity for side-roads.
[367] Consequently the houses, when re-built, were usually put on the crofts. A dispersed pattern of settlement replaced the little huddles of the clachans. The extent to which it was dispersed depended on the width of the lots; the greater the number of tenants to be accommodated in a given area, the narrower were the lots. In extreme cases they might be as little as 20-30 yards in width and then the houses, aligned along the road or access track might form a virtually continuous terrace or street.

CHAPTER THREE

THE CROFTING STRUCTURE

427 In the parish of Uig about 90% of the families are crofters. That is to say, they owe their presence in Uig to their hereditary tenancy of a small-holding of croft status. To these holdings they have a deep attachment; many of them have been inherited through
[428] several generations. Others were obtained more recently during the process of re-settlement of farm land which followed the Napier Commission report and 1886 Act. Many older crofters regard the resettled townships as the fruits of a hard-won victory. Nevertheless, we have seen, very few of the holdings are in fact more than 110 years
[166] old. And, whilst some families can certainly trace their ancestors in the district for several centuries, there has always been a good deal of movement between townships. Thus the claim that they occupy holdings which were carved out of the barren moor by the toil and sweat of their ancestors is, in most cases, metaphor rather than strict truth.

Congestion and Sub-division.

175 The crofting population of Uig started the second half of the nineteenth century w
311 far less land than had been occupied by their forebears fifty years before, and, alth
161 famine, clearance and emigration had slightly reduced the population between 1841
162 1861, (from 3,828 to 3,630) thereafter it again increased, reaching about 4,600 in 1
Rising agricultural prices after 1850 favoured farmers and crofters alike but, whil
427 farmers prospered the crofters merely multiplied, thus in effect reducing the land available to each family. In 14 townships recorded in the 1850 sketch book the 273 ings at that date had become 402 by about 1890, to which should be added a consider number of cottars and squatters, many of them keeping stock and some sharing the
427 of the crofts on which they had built their cottages. Detailed comparison of the re
175 for the two dates shows that the increase had come about in two ways: firstly, it ap
161 that, from time to time, where a new rent ledger was being made up, the factor wo record separately cottars who actually shared the rent of the croft and, secondly, h
162 would recognise and enter some of the squatters who had obtained rent-free (and ill holdings by enclosing and reclaiming from the common. The latter were added to souming of the townships according to the rent put upon them. Table 5 (page 16), illustrates the process. The recognition of squatters, usually at £1-£2 per annum, to the small increases in total rental. For the rest, the increasing numbers were caused by subdivision. Only in a few cases does the proprietor seem to have activ encouraged land reclamation by crofters. On April 17, 1850, four of the families had been cleared out of Reef were allowed to settle on the Callanish common near t Breasclete boundary (hence the settlement became known as 'Breasclete Park'. T rent was fixed at 15/- per acre for five years, thereafter increasing 1/- per annum it reached 29/- per acre; they shared, according to their rent, in the Callanish co pasture. But forty years later one of these crofts had been divided into three, an into two, and two new ones had been carved out of the common; the total rental ha to £13:19/-. Again, when Breanish was lotted in the spring of 1850, ten new lots marked out and the rental is annotated "there are ten young men starting ... these as soon as the season commences". This appears to have been too optimistic; fe any, of the new lots were ever broken in.

The farms, by contrast, prospered and the proprietor was able to share that prosperity by increasing rents as shown in the table:

TABLE 6

195 427 Farm:	Rental in the period: 1840's	1850's	1860's
Mealasta	£90	£105	£105

427 Tables 16 and 18 support the definition of a croft as a small livestock-economy unit,
311 primarily concerned with the provision of milk for the family and young cattle and wool for
231 sale. There are no cash sales of crops - the whole of the land-use is directed towards
[241] the subsistence of the crofter and his stock. The cereals (almost entirely oats) and the
[246] hay (occupying a very small proportion of land for a livestock farming region) are grown for winter fodder for the cattle and sheep. The larger part of the croft is given over to grazing - usually of poor to medium quality - which receives very little attention from the crofter. Less than one third of the holdings have sown grassland (and in these few cases it is normally less than half an acre) - a fact which suggests a passive rather than active attitude of the crofter towards his land.

[244] In addition, every croft has its own small potato plot - rarely more than half an acre to provide for family needs, and most crofts (58%) possess a vegetable garden - again for house use.

[435] Nearly all the crofts carry one or two cows - the second cow ensures a milk supply all the year round. Young stock are sold at one year to eighteen months old, rather than as calves - a result of the incentive offered by the calf-rearing subsidy. The milking stock is replaced very infrequently.

427 Where one croft differs from the next is in the numbers of sheep stock. Table 17
233 shows an even distribution of crofts with more than fifty and less than fifty sheep; but, in
[437] fact, over one third of all crofts have less than twenty-five sheep. Sheep are the only source of money income on the croft, except for the annual sale of the calf, and subsidies, and there is a considerable difference in the size of sheep stock between the truly subsistence and "retirement" crofts on the one hand and the "commercial" crofts on the other. Hence the souming figures, and here note the contrast between Valtos with the sheep stock equal to 111% of the soum and Kneep - 353%!

An attempt has been made in Figs 19 and 20 to relate the size of the stock carried on

Figure 22

An attempt has been made in Figs 19 and 20 to relate the size of the stock carried on the individual croft to the size of holding and to the availability and age of the labour for In both diagrams there is a significant division between the subsistence holding (0 - 7 ur and the commercial holding (11+ units), but there is no definite relationship between sto and size of holding or labour availability. The inclusion of the points of equilibrium fo certain lines in Figure 20 reveals a somewhat unexpected state of affairs: in the case o crofters with regular work and full time crofters, those over the age of forty-five carry larger stock from those under forty-five. It is frequently argued that the solution to th economic problem of crofting lies in the amalgamation of holdings in order to create a more viable economic unit, but the indication from these diagrams is that an increase i the size of holding will not, of itself, lead to an increase in stock. It is the absence of accessible markets that deter the crofter from increasing his agricultural production.

In their present state the crofts in the Valtos area are unable to provide a livelihoo for the crofter and his family. Of the crofters under sixty-five almost 90% supplement croft income by other employment. Of these casual labour (at present mainly at the Gisla hydro-electric scheme) accounts for 57% regular work - particularly weaving - 4 The combination of crofting and weaving provides probably the best return for the labou one crofter with a croft of 3.3 acres, carrying two cows, two followers and ninety shee (sixty ewes) made the following estimates for 1958:

FROM THE CROFT:

Sale of two year-old calves	£80
Cow and calf subsidies	£40
Sale of wool at 4s. 3d. per lb.	£75
	£ 195 (1)

FROM WEAVING -

at two tweeds per week (32 hrs. p.w.)	£550
GROSS INCOME	£745

Weaving about 30 hours a week apparently leaves him sufficient time to run the cro efficiently; at present a crofter supplementing his income by a labourer's wage at Gisl hydro electric scheme would have to put in nearly sixty hours per week to achieve the same financial reward.

The economy of the Valtos peninsula has been changing, and contracting, for sever years. The number of unoccupied crofts is increasing; commercial fishing ended at t time of the first World War; the shielings have been abandoned as summer cattle pastu The Valtos shielings near Loch Scanadale were abandoned during the 1939 - 45 war, du mainly to the lack of manpower in the township, though some was used intermittently u 1953. The shielings of Kneep and Reef were abandoned in the late 1930's, at which tin Kneep had some fifty milk cows as compared with fourteen in 1959.

1 Against this figure, must be set the costs of production (i.e. fertilisers, new seed, winter fodder supplements, sheep dips etc.)

195 After the first World War re-settlement schemes went ahead with renewed vigour.
311 Men serving in the Forces expected land to be available for them on their return and they
427 were impatient to get it. By this time the Lewis estate belonged to the Lewis and Harris
657 Development Co. - in other words to Lord Leverhulme. The farms of Mealasta, Reef,
[471] Carnish and Ardroil were all without tenants; Leverhulme agreed to break them into crofts, the Board of Agriculture surveyors were speedily put to work, and the new settlers were able to commence cultivation on March 1, 1921. Timsgarry farm, with which was the Uig shooting lodge, was in the hands of a tenant; but the Board obtained possission, reserving a small area around the lodge for amenity. Croir farm, Bernera, was also broken up. More than 50 new holdings received enlargements to their common pastures; details are given in Figure 10 and table 8, (pages 22 and 23). The schemes were done in haste, the Secretary for Scotland pushed them forward in the face of some opposition from Leverhulme. Here, as elsewhere, the ex-servicemen were restive; land raids and violence, with inevitable political repercussion, were feared.

In 1924, Linshader farm was threatened by land raiders. As a result this, too, was broken up and 10 new holdings were occupied as from Whitsuntide, 1925. This was part of the Grimersta sporting estate and the proprietors required that all the ghillies be given crofts. Linshader was not particularly suited to crofter-management: it consisted of 49 acres of old arable land and more than 8.000 acres of rough pasture, the furthest part of which was five miles distant and without road access. When the Land Court fixed the souming the following remark was recorded:

"Under a club stock" (i.e. a single flock) the moor "might have been exploited to a very different extent, but in view of the fact that individual stocks are to be kept" (i.e. each crofter his own shepherd) "which is not conducive to hefting, ... 30 sheep per share will be ample. If the whole outside ground were being fully made use of by the sheep stock the grazing of ten cows should do no harm .... but the wintering afforded on the holdings does not justify a larger souming" (than one cow). It had, in fact, been the practise at Linshader farm to buy in young cattle for summer grazing, and to send away the lambs to the Dingwall area for their first winter.

Finally, in the thirties, two long established cottar families at Aird Bheag an isolated spot on the Uig shootings, applied for and obtained recognition as crofters. Their holdings have since been abandoned and now form part of the sheep farm operated by a syndicate of four Breanish and Islivig crofters. Finally, in the 1935 a further 12 new holdings were formed by a partial break-up of Garynahine farm. Thus in all, 140 new crofts and 45,000 acres
[161] have been added to the crofter holdings of Uig since 1878. During that period the popula-
[162] tion of the parish has declined from 4,500 to 2,700. Neither the formation of new crofts, nor the enlargement the old, has prevented depopulation. Little, if any, more land is available and depopulation continues. The only hope, now, is to make the existing land - individual holdings and commons alike - more productive.

Table 8 and the map, figure 10, illustrate the progress of resettlement.

Crofts and Crofters.

491 The parish of Uig is now mainly owned by five small limited companies: Uig Crofters,
427 Bernera Crofters, Grimersta Estate, Carloway Estate, and Lewis Island Crofters. In
311 addition, when Lord Leverhulme sold the Lewis estate a few crofters accepted their holdings as free gifts; consequently they lost legal crofter status (which is confined to tenants) although they continue to share in their respective townships. More recently four crofters in the south purchased some 2,000 acres of rough sheep grazings, including the now defunct settlement of Ard Bheag. There is no official record of the extent of crofters' land, but we accounted for some 95,000 acres (table 9). The remainder con-

471 sists of the sporting estates of Grimersta, Scaliscro, Morsgail and Uig Lodge, on some
311 of which a few cattle and sheep may be grazed, and a few small farms.
427

632 There are 37 crofting townships. In area they extend from 9,000 acres (Linshader)
311 to about 500 acres (Croir, excluding de facto shares in Bernera Shielings). The number
427 of crofter tenants ranged from 4 in Ungshadir and Earshadir to 61 in Breasclete, and the
[162] average amount of land available to each crofter is 7.2 acres of inbye and 126 acres of common pasture (table 10). Averages are misleading. As the table shows, between districts the amount of land available per crofter varies from about 50 to 500 acres; as between townships the range is even wider (table 11). To some extent this contrast is the result of resettlement schemes which, in general, attempted to provide new holdings sufficient to yield a family living. The extent to which they were successful in this respect was limited by political pressure, especially in the 1920's, to provide the maximum number of holdings. Nevertheless the re-settled holdings have twice the average areas of both inbye and common pasture (13.3 against 7.2 acres, and 225 against 126 acres, respectively).

	7.2	9.0	126	157	699	580

NOTE: The distinction between "holdings" and "working units" is explained in the text.

427 Even amongst the old-established townships there is a tremendous range in amount of
632 land available per tenant, the southern districts being best placed and those in the north
311 worst, a situation which still remains. Indeed, the contrast in land available as between tenants (table 11) is a fundamental one; surprisingly, it is not on the whole reflected by a corresponding contrast in stock carried. Together with the rarity of effective fences between or within township pastures, the impossibility of properly hefting sheep to the hills when each crofter keeps his own little pack, and the excessive sheep/cattle ratio, this gives rise to serious problems which will be examined in Part III.

CHAPTER FOUR

THE ATLANTIC COAST

(Brenish, Islivig, and Mangersta)

by

Pamela M. Gough.

131 Brenish, Islivig and Mangersta are situated in the extreme south-west of Lewis, on the Atlantic coast of the parish of Uig and forty miles from Stornoway.

133 Brenish has a south-westerly aspect whilst Islivick faces north-west; in both the elevation of the crofts decreases seawards from about 125 ft. in the east to 50 - 25 ft. in the west. Only one croft in Islivig, and the eight most southerly crofts in Brenish, run to the sea - the rest obtain some shelter from a line of low hills about 300 yards wide and rising to a little over 100 feet, which forms their western boundary. The land terminates in low cliffs from 25' - 100' in height, and a rocky foreshore. Behind these townships to the east a range of mountains from 1,500' - 1,800' in height and dominated by the highest hill in Lewis, Mealisval, (1,885'), gives protection from easterly influences.

134 Mangersta lies to the north of these mountains; here the crofts lie in a sheltered valley to the west of which the land rises to over 200 feet. The valley opens southwards to the sea where there is a sandy beach and machair. The crofts range from about 150 feet to 100 feet above sea level; those nearest the sea have soils which contain a substantial proportion of machair sand.

Soils are generally deep, and there are few rocky outcrops on the crofts which are fairly level. In Brenish and Islivig the soils are mainly peaty, becoming wetter in the west. Where visible the sub-soil is gravel or stony boulder clay. In Mangersta the transition from peaty soils on the northern crofts to sandy soils on the southern crofts, is marked by the increasingly continuous cultivation, drains being unneccessary on the latter.

137 There are no trees or shrubs, and vegetation consists of marshy grass moors in the Mealasta area with a considerable amount of cotton grass bog further north. West and south of Mangersta the machair area is characterised by a calcsole plant community similar in content to that found in many parts of the chalk and limestone areas of England.

361 [172] Brenish and Islivig are old settlements, never cleared. In both, the sites of the original clachans can still be seen clustered around the mouths of their respective streams. The houses are now situated at the east end of the crofts, near to the road.

175 632 311 To the south, Mealasta - cleared in the 1840's to make a sheep farm - was divided in 1921 to give enlargements to the common grazings of both Brenish and Mangersta. The arable land was divided into twenty-nine shares as enlargements to Brenish crofts, and is held in a modified form of runrig.

Mangersta was cleared in 1837 to make a farm; subsequently fishermen-cottars settled on the farm but they moved to Dun Carloway in 1873. In 1910, however, a new township of thirteen crofts was set up by the Congested Districts Board; the new settlers were cottars, mainly from Brenish.

/facing p. 32/

491 Brenish, at the end of the tarred road which also serves Islivig, is forty miles from
[484] Stornoway. On the thrice weekly bus the return fare to Stornoway was £1, and freight
cost half-a-crown for a hundredweight, but because of competition from privately owned
vans the bus service ceased in 1960. Mangersta is reached from the same road by about
a mile of untarred side-road of indifferent quality; formerly the only access to it was by
[366] a footpath over the sands to the south. General merchandise, fish and meat are supplied
[205] by weekly vans; there are no shops. There is a post-office at Islivig; banking facilities
[453] are supplied by a mobile bank.

311 The majority of the crofts are long narrow strips, with those in Mangersta being some-
427 what more compact. The area ranges from two to nine acres, with an average of about
four acres; in Brenish and Islivick only about half is usually arable. All the crofts - or
croft-units - are fenced, the work having been completed in Brenish in 1959. There are
twenty-nine crofts in the rental for Brenish, ten for Islivick and thirteen for Mangersta;
but, owing to amalgamations of various kinds the number of operative units is considerably
less - fourteen in Brenish, five in Islivick and ten in Mangersta. There are no cottars.

134 As soils are reasonably good and comparatively free from rocky outcrops, the arable
409 patches are large enough to be cultivated with a horse or tractor. There is a tractor in
[231] Brenish, and four horses, a horse in Mangersta and two in Islivick. All of these are
hired for ploughing and carting peats. Very little work is done with the spade, unlike
many of the other Uig townships.

233 While the general rhythm of township work through the year is similar to other areas,
here the sheep are wintered up on the hills; some crofters winter lambs on their crofts.
Brenish crofters are allowed to winter eight sheep, (or sixteen hogg, or four year-old
heifers), on Mealasta Island - hogg are usually sent since their loss, by falling over the
cliffs, is less serious than the loss of heifers. Eilean Molach is used by Mangersta
crofters, who are allowed two sheep each in summer.

241 The only crops grown are potatoes and oats, with "black oats" (Avena strigosa) on the
sandy soils in Mangersta. Since seed for "black oats" is unobtainable commercially,
the crofters save their own. A grass mixture is sown by the majority of crofters for hay,
to qualify for the subsidy.

233 The extensive hill and mountain pastures are not separately fenced; sheep from all
three townships graze over all. If the total sheep stock of the townships (about 3,300) is
compared with the souming figures it is found to exceed the soum by about 50%. On the
other hand, fewer cattle and horses are kept than formerly so that taking the total stock
for all animals (horses, cattle and sheep) and comparing with the actual stock now carried,
the area carries only 87% of the stock which the soum allowed. In the two older townships
the souming was reckoned according to rent, being one cow, one two-year old and eight
sheep for each £1. In Mangersta, however, the soum was one horse, three cows, one
heifer, two stirks and twenty-five sheep for each croft.

Lambing percentage is about 80, and ewes form about 60% of the total sheep numbers
[236] (excluding lambs). In this district some wedders are kept for three years and then sold
[435] for meat, but the main income is from wool, about three pounds weight from each sheep,
which sells at up to four shillings a pound.

231 Most crofters keep one or two cows, and the calves are normally sold in the autumn
or spring sales. Brenish and Mangersta each have a bull, and in the three townships there
are sixty-seven cattle and thirty calves. Shielings, formerly used for about seven weeks in

511 It is obvious that crofting no longer affords a livelihood in Aird; the only two families
464 without ancillary occupations are those where all the members are elderly. Of the others
288 with members in the working age-groups, five have one or more members employed in a civilian capacity at the R.A.F. station and there are five regular weavers.

621 Aird used to be a self-contained community; the land was fully cultivated and a certain
178 amount of fishing was carried on in spite of the difficulty of drawing up the boats over the rocky beach. Now it is prosperous, but very much dependent on the R.A.F. station, and if this should ever close down, most of the younger people would have to leave in search of other employment.

CHAPTER SEVEN

VALTOS, KNEEP AND REEF

by

David G. Symes.

131 On the eastern side of the Aird peninsula, facing east to Loch Roag is a secondary
133 peninsula of more moderate, but none-the-less broken relief. This, together with an adjacent area of the main peninsula, the islands of Pabay, Vacsay, Vuia Mor and several smaller islands, comprises the territorial limits of the townships of Valtos, Kneep and Reef.

133 This secondary peninsula is accidented in the extreme, with outcrops of bare rock and steeply angled small hills. The relief is greater in the west (summit 450') than in the east (summit 275'). Relatively level land is to be found only on the machairs of Reef and
133 Cliff (the latter only poorly developed) and on the glebe at Uigean. The Reef machair,
134 about 180 acres, consists of a succession landwards of tidal sands, a belt of sand dunes (c. 20' O.D.) and a sandy plain sloping gently inland towards a reed filled lagoon. The machair at Cliff is approximately 40 acres in extent; here there are fixed dunes and, in addition, the sand has been blown inland to at least 100 ft. O.D. Except where the machair sand has drifted upslope to produce a "brown machair" of mixed sand and peat, the thin soils of the Valtos peninsula are predominantly peaty. Although the length of the peninsula faces north the extremes of Atlantic weather are moderated by the protection afforded by the Aird peninsula and the islands of Pabay and Vacsay.

175 In the period before the lotting of crofts the whole peninsula was occupied by some five
429 clachans - Valtos, Cliff, Kneep, Uigean and Reef - some of which shared common pastures.
361 During the early part of the nineteenth century and earlier, apparently, than the 1850 lotting
[632] carried out in most of Lewis, crofts were allotted in each of the clachan areas: Valtos and Cliff shared a common pasture and so became one township; similarly Kneep and Uigean were combined.

175 In Kneep it seems that the croft boundaries were not accepted by the crofters. Certain
311 basic divisions between groups of crofts (usually three in number) are discernable today,
427 and within these basic divisions a certain regularity of distribution of strips persists, but

134 Alluvial soils have developed along the lower reaches of Amhuinn Thoraghair and the Eris river.

137 [824] There are no trees apart from an occasional stunted rowan or willow - willows for creel making grow still in some old garden enclosures. Hedges, too, are rare so, altho individual houses are often carefully sited, there is little cover and the townships as a whole are very exposed to westerly gales. The natural vegetation developed on the mach is of fine closely matted grasses with a good deal of natural clover - very similar to that found on chalk downland. On the peaty moorland the usual moor grasses mosses and heather are dominant, though little encroachment by bracken was noticed.

311 361 427 In Crowlista the strip layout of the crofts dates from a lotting about 1850, (Figure 14) in the new townships, laid out about 1921 (Figure 15) the majority of the crofts are less strip-like and do not run to the shore. Indeed in Ardroil and Timsgarry only five out of twenty-two reach the shore and the rocky headlands with their machair are valuabl parts of the common pasture. The six crofts in Carnish run from the shore at the foot of the esker up its flank towards the southwest and almost to its summit. They also hav one or two small plots each on the machair.

[133] Crofts in Ardroil are in one piece. An old cattle road forms the north west boundar from this they rise, steeply in places, to undulating moorland just over 200' high. Num 5 - 8 Timsgarry are strips across the Erista valley, rising northwards to just over 170' 2, 3 and 4 are allotted to make use of arable land on the lower slopes of Knock Valabrie. The houses of crofts No. 1 Timsgarry and No. 1 Ardroil are the former farmhouses.

[417] In Crowlista most of the crofts remain unfenced but in Carnish, Ardroil and Timsgar all are fenced and many of the fences were being repaired or replaced in 1959. They ar not open for common grazing during the winter. Patches of sown hay are fenced within each croft.

[316] There are six recognised croft-holdings in Carnish; one is sub-let so that there are only five "operative" units; two of those are not worked. One has been resumed by the proprietors and is being quarried as an extension of the main quarry between the township dyke and main road. In Ardroil each of the fourteen crofts is worked as a unit - though two carry no stock; in Timsgarry eight crofts are worked as seven units.

In contrast to the above, the old settlement of Crowlista has twenty-five recognised crofts but, by amalgamation and sub-letting these are worked as fourteen units. The Crowlista crofts are small - fourteen are 4.0 acres or less and of those only one is worked as a unit. Crofts as small as 1.5 acres and with a soum of eight sheep can neve have been intended to support a family; they are the result of sub-division in earlier generations; the remains of two piers and a curing house point to the importance of fishing in the past. Twenty-one men were employed in fishing boats about 1914. Sub-letting usually takes place between relatives; of some of the fourteen operative units are quite complicated. One example will suffice (croft numbers are here replaced by letter to prevent publication of personal matters):- [464]

Crofts a, b, c and d are worked as a unit (although they are not adjacent). The tenant of a and b sub-lets c and d for grazing; he also helps with the work on yet a fifth croft. The present b is half of an original croft. West of the road the original croft is held in fixed runrig between b and another croft, not part of this multiple "working" unit east of the road it has been divided into separate strips. The tenant lives on b.

133 The 1,700 acres of common pasture stretch to the east and west of the crofts, across
the peninsula which terminates in Gallan Head, extending to those of Crowlista and Valtos
231 in the south. The whole coast is broken and rocky, the land inland is peaty, and Aird
654 lacks the advantages of the machair land found further west. To the north of the village
there is now an R.A.F. radar station on Rudha Caol, built on what was part of the common
pasture. It dominates the landscape and makes a considerable difference to the life of the
inhabitants.

361 The township, though isolated, is reached by a good road which leaves the main road
491 at the western end of Glen Valtos. Grocery vans call on Wednesday and Friday, a
443 butcher's van on Saturday, and the local people are also allowed to shop at the N.A.A.F.I.
within the Camp. The road through the village approximately follows the line of the 100
ft. contour and all the houses are built directly on to the road, with byres, weaving sheds
and other buildings behind, whilst in most cases hens are kept on the steeper slopes below
205 the road. Thus the settlement has far more of the appearance of an English village than
342 have most crofting townships, but there is no shop or post office. The majority of the
houses are stone with slate roofs and fairly large, though some of them have been built for
354 more than fifty years. All have electric light and their own water supply and several have
312 modern byres.

427 There are ten crofts, as the enlargement of one of the original nine was subsequently
311 split off to make a separate croft. Of these, one tenant is an absentee and another an
elderly woman who does no cultivation. In both these cases, grazing is let to others so
491 that there are actually eight operative units. The crofts are fenced in their upper portions,
but in most cases the fencing does not extend down to the river and there is free access to
the single concrete footbridge which spans the stream.

241 The only crops now grown are oats and potatoes and a few vegetables, with some sown
grass; natural grass provides most of the hay crop. Lime and shell sand and artificial
fertilisers are used; the two former particularly on the ground near the river where the
cultivation is in narrow strips separated by drainage ditches and ploughing is done by horse.
407 Most of the cultivated land is on the gentler slopes behind the houses, where the use of a
tractor is possible. Before 1914 most of the land within the original turf dyke was culti-
824 vated; bere was grown and ground at the mill for meal for barley bread. Seaweed was
extensively used as a fertiliser and most of the families kept eight or nine cows, so that
231 there was a more plentiful supply of manure. Now, six of the families each keep one cow
for domestic milk supply (two of the others each keep a goat). The township possesses
no bull, but make use of those at Valtos or Ardroil.

233 On the other hand, the sheep sbum is generally exceeded; instead of the entitlement
of about 200, the total flocks grazed on the township pastures are approximately 500. The
lambs are weaned early in August and put on Rudha Caol (Air Force use has not prevented
this) and wedders are usually sold at the age of two or three years in Stornoway - many
in October to reduce the numbers that must be pastured during the winter.

162 The total resident population of Aird consists of fifteen males and sixteen females.
Of these, twelve are over 65, six are aged 45 - 64, 11 are in the 15 - 44 age-group (there
are only three married couples) and there are two children under 15. Nevertheless, most
of them are complete families; only one person lives alone; no members are reported as
164 periodically working away, no men and only two women are permanently away. Neither
has there been much emigration since 1939 - five women only have married out of the
parish. The tenants of seven of the crofts are over the age of 65, the only one in the 15 -
44 age-group is a new-comer to the district and does little croft work.

241 198 The area under cultivation has contracted in the past twenty years. Before 1939 most crofts had about twice as much land under cultivation and at Valtos some were cultivating small patches outside the township fence. The cultivation of the common machair at Cliff ceased in 1939. The land had been "too long in labour" (potatoes had been planted on the same ground for nearly one hundred years), and the soil had been affected by over-liberal applications of sulphate of ammonia which replaced the traditional soot-impregnated thatch from the black-houses. Moreover the Cliff machair was particularly vulnerable to "blow-outs" after ploughing. Cultivation of the Kneep common arable has all but ceased, and the fifty-two acres of arable machair in the township of Reef have been untouched since the 1930s. It is noticeable that the common machair cultivation and the shieling economy ended about the same time. Smaller numbers of better-quality cattle were needed to meet [231] the daily milk requirements of the croft; a much smaller area of cultivation was therefore needed to provide winter fodder and consequently more land was available on the croft for potato cultivation. Consequently the more distant machair was replaced by cultivation within the croft.

433 178 Contraction and decline of the economy is common to all three townships, but the form and cause of this decline is different for each, and where the township consists of two separate settlement nuclei there is frequently a difference between the two parts:

632 127 361 311 The township of Valtos is in two distinct parts: crofts 1 - 34 are a succession of narrow strips about ½ mile in length stretching from the shore to about 200' O.D.. The boundaries of the outer crofts (nos. 1 and 34) if projected to a point on Pabay, form an angle of 45°, so that the crofts are narrower at the shore (40 - 70') than at the upper limit (100 - 180'). Of these 34 crofts, 19 are in so-called runrig, eight in pairs and one group of three. (Fig. 21). Cultivation is carried out on numerous intermixed small patches, held permanently; the grazings are interchanged at the year end. Fragmentation imposes a severe limitation on the economic efficiency of the croft. None of the crofts at Valtos is individually fenced though some groups of two or three are fenced together. With the contraction of cultivation [241] only the less steep areas are cultivated, to facilitate ploughing.[1] As a result, the bulk of the cultivated plots are to be found at either end of the croft - near the shore and on the hill top against the township fence.

The remaining five crofts of Valtos, and a squatter, are at Cliff in the valley separating the Valtos peninsula from that of Aird. Here the crofts are fenced, more compact and slightly larger (4.8 acres as against 3.8 acres) and they occupy more level terrain than [241] those in Valtos. Two of the crofts are worked in runrig - these being situated on the machair. The houses are set back about a hundred yards from the road, along the western township fence.

Kneep township is again in two parts: Crofts 16 - 18 together with the Manse and two cottars, are situated across the neck of the Glebe promontory, on the south side of the peninsula. The five legal crofts are today worked as three units, fenced, reasonably compact and with holdings of exceptional size for the area - average 15.1 acres. Crofts [433] 1 - 15 at Kneep on the northern side of the peninsula adjoin those of Valtos. Here is a climax of land fragmentation, which imposes severe limits upon croft efficiency. Twelve of the fifteen crofts are worked; of these only numbers 4 and 5 are compact homogenous crofts; numbers 3 and 6 are compact except that part of the land which lies within their boundaries belongs to croft no. 13. The remaining eight crofts comprise a hundred and eight separate plots of croftland and fifty-two separate plots on the common machair. One croft with 2.8 acres arable the average size of each piece is a mere 0.15 acres! [233] The grazing land on the croft is divided into strips running across the slope, which are interchanged each year, whilst a large part of the common grazing lands are divided into

1. Pre-1939 much of Valtos was cultivated in lazy beds - by spade. Today 9% is cultivated by spade; 43% by horse plough + 48% by tractor.

632 361 427 311 233 strips running across the slope, which are interchanged each year, whilst a large part of the common grazing lands are divided into interchangeable sections ("quarters") to accommodate each of the groups of crofts. See Figures 22 and 23.

The cultivable croftland at Kneep is relatively flat and the natural drainage is poorly [132] developed; the quality of this land, depends to a very great extent on the upkeep of a dyke running across the croftland from a small marshy loch to the sea. This dyke has not been [312] cleaned for several years, and as a result a large area has been invaded by reeds. Other parts of the croftland have been similarly overrun by 'wild rhubarb'. Such deterioration is almost inevitable when land is so fragmented.

The crofts at Reef are grouped in three separate localities. Crofts 1, 2 and 3, on the edge of the machair have probably never been occupied since the crofts were allotted in 1921 and are now used only for grazing. The main body of the crofts (nos. 3 - 13) face south - they are more compact than those in Valtos and Reef, but they vary in size from 2.9 to 13.25 acres and their boundaries are irregular in shape. Two crofts (14 and 15) are separated from the main parts of Reef: they are both small (2.5 acres) but the size is compensated by their situation on the level terrain of the machair. The old farm house is used as the dwelling for both 14 and 15. Much of the cultivation at Reef, except on the [241] machair crofts, is on lazy beds - but many of these have decayed with the advent of horse [407] and tractor ploughing; 35% of the land is cultivated by spade, and the remainder by horse plough.

433 The crofting economy is probably at its lowest ebb in Reef. Only eight of the fifteen crofts are occupied and of these five are worked by disabled crofters or crofters over [729] sixty-five. The Reef crofts were settled in 1921 by returning ex-servicemen and today seven are being worked by the original settlers; there is little evidence of a desire among the younger generation to succeed to the crofts.

[233] Until 1956, crofters on Reef used to graze both sheep and young cattle on the Flannan Islands, fifteen miles west of Uig.

162 Fig. 24 shows the age/sex structure of the population in the three townships. It tells a story familiar to crofting townships: 55% of the resident population are over forty-five years of age; 9% of the total population are permanently away; and since 1939 the population has declined by at least 15% as the result of emigration alone. But perhaps the 163 most significant fact is the very small proportion of women of a child-bearing age and the consequence that only three children are being born each year to replace the older generations.

131 20 By their very position, the townships of the Valtos peninsula are isolated. Fifty years ago communication with the rest of Lewis was by boat. The road to Valtos and Kneep was built originally to bring the mails from the pier at Meavaig; the motor road to Reef was completed in 1956. Shopping facilities are provided at Valtos, for the people at [443] Valtos and Kneep, and at Meavaig which serves Reef, Uigean and Cliff. These are supplemented by travelling shops which call once per week, by Indian dealers and by the local 'bus-driver who makes purchases in Stornoway on behalf of customers on the [346] peninsula. The school for the whole area is situated mid-way between Cliff and Valtos and two kirks and the doctor's house lie at the junction of the Valtos and Reef roads.

CHAPTER EIGHT

LITTLE LOCH ROAG DISTRICT

(Meavaig, Caryshader, Ungshader, Geshader, Enaclete and Gisla).

by

Annis Heawood.

133 Little Loch Roag is a narrow sea loch extending southwards about twelve miles inland
[131] from Loch Roag proper. It has been formed by glacial erosion picking out one of the
[134] n.n.e. to s.s.w. lines of weakness characteristic of the Lewisian gneiss. Although generally steep-sided, recent glaciation left much ground moraine and this material, best preserved on the less steep slopes, provides arable land for several small townships on or near its western shores. The eastern shores are the more rugged and although a few small townships once existed there is now only the small farm and shooting lodge of Scalisacro. At the head of the loch is an estate cottage for Morsgail Lodge which is a large mansion with extensive fishing and shooting rights, grandly isolated about a mile inland from the main road.

361 The district here described includes Gisla, near the head of Little Loch Roag, Enaclete,
[133] Ungshader, and Geshader, on the western shores of Loch Roag proper. All these are strung out on or close to the main road. Meavaig, like Gisla, is a small farm but also
365 functions as something of a metropolis for south Uig; it has the post-master, whose other functions include registrar and receiver of wrecks it has two churches, a telephone exchange, the district doctor and manse, and a petrol pump. At the time of our visit it was also the base for the 'bus service. Its metropolitan functions arose in the days before the road replaced a ferry boat service from Callanish; here the mails were landed until some date in the 1920s, and here, too, the estate kept coach and horses for transport to Uig lodge, three miles further west.

361 There is no record of the original settlement of the four crofting townships, nor of
365 Gisla, which was a township (or 'joint farm') of five crofters until about 1850. Some modern houses and bungalows have been built, many with easier access to the road than
[232] the old black houses, now often used as byres. Water supply does not seem to present a serious problem because of the extensive moorland gathering grounds to the west, but there are not at present any water-supply schemes. Electricity is, of course, available. Caryshader and Enaclete are on the main Stornoway road being served at present by the 'bus and by vans selling meat, groceries and fish at least once a week. Enaclete has a sub-post-office. Geshader is less fortunate since, although vans call regularly, 'buses must be met at the junction of the unsurfaced track and the main Stornoway road, where the school serving this district also stands. The track has been extended in recent years so that it now reaches all the houses. Ungshader, however, is smaller and although it has had similar delivery arrangements, it is now a dying settlement largely due to its inaccessibility.

427 The crofts are mostly regular in shape on the landward side and fenced except where
632 the land is very broken as in northern Enaclete. In Caryshader there are fourteen legal crofts which at present are worked as eleven units; one is used only as a holiday home
●311 by its owner-occupier and there is one squatter on the common grazing. In Geshader there are eleven crofts, each worked independantly; Ungshader has four crofts but the

427 joint tenants of one have moved to Geshader while continuing to work the Ungshader land.
632 Another is preparing to move to Enaclete and yet another lives on a feu at Loch Chroistean
●311 Cottage. At present, three working units remain. Enaclete consists of nine crofts with ten units, one being rented by joint tenants.

221 The rhythm of work is similar to that in other parts of western Uig. Potatoes and oats are planted in April followed by lambing and peat cutting in May. In June and July the sheep are shorn and subsequently sent to the common grazings. In August the peats are carted, once they are dry, by lorry direct to the crofts. Hay-making follows. The lambs are weaned in September, harvest is then carried in and tupping and statutory dipping take place in November. The sheep are then returned to the township grazing though the lambs
241 may be fed with hay on the croft. There is little regular crop rotation and only a small number of crofters seem to undersow oats, thus improving the quality of future hay crops. Gardens are not important and only provide for family needs but Caryshader particularly has a number, some growing flowers as well as vegetables. Fertilisers vary widely from croft to croft as well township to township. Enaclete potatoes are still grown near the shore and thrive on seaweed; those of Caryshader are usually fed on artificials.

231 Most crofters keep one milk cow with a calf; a few rear a young beast for the autumn sales in Caryshader. However, some now rely on their neighbours for milk in return for grazing and one croft has turned to goats, as giving less trouble. The bull for the whole district is a beef shorthorn and is kept on Geshader -Ungshader common grazing as it is completely fenced; and Geshader is responsible for its upkeep.

233 Lambing seems to have been generally good in 1959 but it was not easy to get exact figures. The Morsgail Estate and Gisla farm also run considerable flocks. The common pastures total 3,119 acres with an enlargement, formerly used as shielings, of 1,215 acres for Enaclete, Geshader and Ungshader near Loch Suainaval, and for Caryshader 88 acres
[344] on Floday island. The shielings have been disused since the war. Peat is normally cut to the west of the road but at least one elderly tenant in Geshader has kept a section of his croft for this purpose to save the effort of working further afield.

241 Generally speaking the land now cropped only represents one third to one half of that
178 worked by spade 20 - 50 years ago when the crofting population was larger and when much greater numbers of cattle were kept through the winter, thus requiring more potatoes and
231 more oats. The cattle numbers are much less than the total souming but sheep are in excess. In Enaclete, at least, overgrazing by sheep has caused a decline in grazing quality.

464 Clearly in these townships, apart from the very few crofts still fully cultivated, the means of livelihood is sought elsewhere. At present there are altogether fifty-three men in the working age group (15 - 64) in all four townships. Of these fourteen are away, nine permanently and five periodically. Thirty have regular or periodic employment besides crofting and of these seven work at Gisla on the hydro-electric scheme, seven weave, some of them part-time, four hire out vans, two do post-office work and others have varied occupations while only three are full-time crofters. At present there are few men in the Merchant Navy and fishing does not provide an occupation although many share rowing-boats in their spare time, and fish for domestic use.

162 The population as a whole is ageing and of the group between 15 and 64, forty-four
[169] (roughly 30%) work away permanently or have emigrated. It is noticeable that there are few crofts worked by people with young families

000 In conclusion it may be re-emphasised that the fate of the crofting townships depends more

Notes:

(a) The total areas of common and intye land for each township are given in the text.

(b) Soumings have been calculated according to the rent operative at the date when the grazing regulations were first made unless some other rent is specifically quoted in the regulations.

(c) The sheep totals are known to be incomplete but the proportions (ewes/lambs/others) are as reported (see Appendix A (2)).

(d) Where there is a specific soum for a horse this has been added, (half to the cattle soum and half to the sheep soum) after allowing for any horses actually present.

(e) Where there is a soum for two-year old cattle this has been included in the cattle soums at the rate of 2 two-year olds to one soum.

428

Problems of communication are not, however, solved merely by providing better roads: at least one household in four has a car or van, and this, with the fall in population, has caused a fatal decline in the use of public transport. The Bernera 'bus service was discontinued in August, 1959, for lack of demand. This is not, of course, an isolated example; the problem is common to all the Highlands, and indeed, to all the rural areas of Britain: in Sutherland, for example, the number of registrations of private cars has risen to very nearly 250% since 1945, and the total number of registrations for all classes of vehicles up to 1938 had risen to almost 200%, while the number of hackney carriages, after reaching a peak in 1952, has since declined by 70%.

DISTRICT TOTAL	13.1	13.5	183	188	196	201	1:15.0

Note: in this table, "working units" include all crofts, whether stocked or not, and all other agricultural holdings. Two or more crofts worked together, whether registered under the same tenant or not, are counted as single working units. An agricultural holding is defined as one with at least one cow, or five sheep, or half an acre of cultivation.

Crofts and Commons

423
427
311
632

A crofting area normally consists of the croft land proper - the inbye (arable and unimproved land, and various common grazings. Table 20 summarises the situation in Bernera. Kirkibost has by far the largest inbye and the Bernera Island townships generally are larger than those of Bernera Shore. That the positions are reversed with regard to common grazings is due to the limited hill of Croir and the very extensive hill of Linshader. The Bernera Island townships would, however, be much worse off for hill land had they not various special common grazings (except Croir) and did they not share in the 4,341 acres of the Bernera shielings on the mainland. It is possible to calculate the appropriate shieling share for each township on the basis that, though the theoretical sums for each township and common grazing are exact, in fact all working units may send animals to the

423 shielings, and that therefore the shieling area per township is in proportion to the number
427 of working units in that township (total, 88 working units on the island). If these shares
311 are deducted it will be seen that only Kirkibost and Tobson common grazings exceed in
632 area those of Lundale, the smallest of the Bernera Shore grazings, and that even this is
(449) no longer so if the special grazings, mainly later enlargements, are further deducted.
All this serves to emphasise the relative crowding on Bernera Island and the consequent
vital importance to most working units of the shielings. This has probably increased in
the last decade with the construction of the bridge, for whereas previously there was a
biannual ferrying operation to the mainland, tedious, unpleasant, and exhausting for both
beast and man, nowadays droving to the hills is an easy matter.

A somewhat different picture emerges when land is related to tenants and working units (table 21). If the inbye per croft tenant is calculated it is seen that Croir has the largest, (29 acres), rivalled only by Lundale, (26 acres), Hacklete, Kirkibost, Earshader, and Crulivig form an intermediate group (11 to 16 acres), while Breaclete, Tobson and Linshader have but eight acres or less. However, the average area of inbye is more revealing if calculated in relation to working units: then the Bernera Island townships are seen to range from 7 acres (Breaclete) to 33 (Croir) while only Lundale has more than 20 acres, the others having 14 or less. For the whole island the average of inbye per tenant (13.2 acres) is close to that for the Shore (12.8 acres) and the inbye per working unit (13.5 acres: 13.3 acres) is almost identical. Thus, there is considerable variation in the amount of inbye land available per tenant and the amalgamation of tenancies into working units does not seriously change this distribution.

None of the Bernera island townships has as much common grazing per tenant, nor per working unit, as any of the Bernera Shore townships, (little more than 100 acres as opposed to never less than 160 acres). The Bernera Shore townships as a group have about five times more pasture per tenant and per working unit than those of Bernera Island. Breaclete stands out as the township with the greatest shortage of land.

The various forms of subdivision and amalgamation of crofts and parts of crofts, or other holdings, are summarised in Table 22. In the small townships of Bernera Shore only Earshader, with four crofters, has non-crofting holdings with stock; there is little amalgamation. In Bernera Island, however, only Hacklete has the same number of working units as of registered croft holders and Breaclete, the township with the greatest shortage of land, is also the township with the greatest degree of unofficial change and intromission. In contrast, Tobson, in spite of its unconsolidated plan, presents a simple picture. Breaclete also has the largest number of feus, including the only feus not functioning as agricultural units. This emphasises its function as a centre for the island.
(368) It has both manses, both churches, the War Memorial, the school and the District Nurse.

These changes must however be seen in perspective. The Bernera region has not
118 suffered from the type of amalgamation which is the result of decay and which facilitates
427 further decay; the actual change is not very great. The number of agricultural working units is 98% of the number of crofter-tenants. It is illuminating to compare the region with Sutherland where many former crofts, quite abandoned to rough pasture, have been taken off the rentals. Apart from change due to clearances, the Bernera region has none of either type. Of 575 holdings examined in thirty-one townships in Sutherland, amalgamation has reduced the number of effective crofting units to only 437, i.e. 76% of the formal figure. Amalgamations by family co-operation are comparatively few in Sutherland (26 out of 173 known examples) whereas subletting is common. A further brief example may be taken from one of the Shetland islands where amalgamation has reduced the original number of holdings from something like 350 to about 250 working units.

TABLE 23

Once the interchanges are understood and the numbers of working units accepted, it is possible to analyse the relative inbye sizes of the agricultural units, (table 23). Croir and Lundale have the highest average size and highest modal means; and the other townships with the exceptions of Breaclete, Tobson and Linshader, falling in the 10.1-15 acre class. On Bernera Shore, Linshader has the smallest working units but the range of variation even there is comparatively small, whereas on Bernera Island, except in the resettled township of Croir, there is always a range of five or six categories. Hence the occasional divergence between the modal and arithmetic means. Again this is the cause and sign of a greater degree of adjustment on Bernera Island.

423 Stock - potential and actual. *

427 The croft is in almost every case primarily a stock raising unit and cultivation apart
(from certain items - particularly potatoes for domestic use - is connected with stock
231 rearing. The basis of the stock system is the soum, the share of the common pastures
in terms of horses, cattle and sheep. The largest total soums (more than two hundred
311 cow-units) are held by Hacklete, Kirkibost and Tobson; all the other townships have a
hundred or less cow-units (Table 24). This has some relation to the size of common
632 grazing. The very large area of Linshader is that of the former farm: the present

* Details of actual stock and souming for each township will be found in Appendix A.

231 soum is less than the capacity of the grazing and represents the Land Court's estimate
423 of the stock the crofters would be able to keep: the consequent disc re-
427 gression in total stocking is a typical result of the replacement of commercial farms by
crofting subjects (c.f. page 25 above). It is better however to consider the area of
•311 common grazing and soum combined: in fact, the average acreage per cow-unit is fairly
632 uniform for Bernera Island, (8.7 acres). Bernera Shore has a wider variation of from
(1.6 to 100.9 acres per cow-unit: obviously, either the Bernera Island townships grazings,
particularly Bernera shielings, were originally estimated as of superior value, or, for
whatever cause, the common grazings of Bernera Shore are relatively under-used. How
is this reflected in practice?

TABLE 25

231 CROFTS:
•311
427

Figure 29

SOUMS and STOCK

231 311 632 Hacklete, Kirkibost and Tobson have by far the largest total holdings of stock but are eclipsed in regard to percentage of soum actually held by Breaclete, Croir, and all the Bernera Shore townships. In fact the average percentage soum held is 66% on the Island as against 114% on the Shore. If efficiency is interpreted in terms of stock rearing therefore, Tobson is less than 50% efficient, Hacklete and Kirkibost 50% to 75% Breaclete Linshader and Lundale 75 to 100%, and the rest 100% to 175% efficient, the average falling at 75%.

It is also interesting to remark the area of common grazing per cow-unit actually held. This shows that, in effect, the Bernera Island townships, as might be expected from their use of one main common grazing, have much the same amount of land per beast The Bernera Shore townships apparently need rather larger areas of land per cow-unit; the excessively large area shown for Linshader indicates understocking.

[427] Figure 29 summarises the incidence of soums and actual stock carried. It will be seen that, although there are some crofts with soums of under five and over fifteen cow-units, the majority lie between those limits with a marked peak in the 7.5 to 10 cow-unit class. The largest soums tend to be under-utilised. Figure 28 shows the percentage of the soum held. Almost a quarter of the working units have less than 50% of their soum and must therefore be considered as inefficient in their chief function of stock raising, about one third have 50 - 100% and rather less than 1/3 have over 100%

The incidence from township to township varies (table 25) but generally the Bernera Shore townships have more uniform individual soums than the older and larger Island townships, though the range of size of stock holdings and consequently of soums held is more comparable. Table 25 shows the average soum per croft or working unit: Breaclete and Croir are similar with only just over half the average for the rest of Bernera Island. None of the Bernera Shore townships have soums as large as the bigger Island ones, and one of them, Earshader has no more than Breaclete or Croir. Kirkibost and Tobson stand out as far the most generously treated townships, but is this justified in practice?

Expressed in terms of cow units, (table 25) the total soums reveal that, on Bernera Island, only Croir is really efficient with just over 100% of its soum: Breaclete, Hacklete and Kirkbost are satisfactory - and no more - with 60 - 80%; but Tobson has only 45% of its soum. This is a very much poorer showing than that for the Bernera Shore townships, only one of which drops much below 100%. Therefore on the Shore the soums, though smaller, are better taken up than on the Island. Further it is clear that, of the individual working units on Bernera Island, none of those of Croir are unsatisfactory, three out of sixteen at Breaclete are not satisfactory, five out of twenty at Hacklete, eight out of twenty-eight at Kirkibost and eleven out of nineteen at Tobson, whereas on Bernera Shore there are only two unsatisfactory units - at Linshader - one of which is presently vacant with a dispute over the tenancy.

231 233 311 But so far, only the total soum has been considered: in fact it is necessary to consider the elements of that soum, for in order to maintain the pasture one must have a stock suitably balanced as between cattle and sheep. When the soums were originally calculated this was borne in mind and were every soum fully occupied in the proportions originally planned, the balance of grazing would presumably be satisfactory. Table 26 shows the stock equivalents in sheep units. In Croir the soum would indicate a marked preponderance of cattle +, in Linshader (with its extensive hill lands) of sheep; otherwise there is a rough balance in the soumings between large and small hooved beasts.

[656] Occasionally there are special permissive or restrictive clauses in the regulations. For instance, on Breaclete township common grazing, "...a landholder...shall be entitled to graze thereon, free of charge, during summer and autumn, two hogg for every pound sterling of rent, for replacing the cast ewes...". Similarly, in Linshader horses are not allowed on a fenced area of 800 acres, and on Little Bernera horses are specifically disallowed. But generally the various classes of stock have clear equivalents which are freely interchangeable. How does this work in practice?

---

[698] + Editorial Note: this was probably because, when the Land Court determined the soum, Croir had no share in Bernera Shellings. This now calls for adjustment, which should be made when the Crofters Commission re-enact the local Grazing Regulations.

TABLE 26

231 is probable that the constant but rather low incidence of cattle on the Island is governed
233 by two factors: first the shortage of common grazings near the township and the neglect
311 of the only alternative source, the shielings, and second, the memory of past isolation -
632 and the present impossibility otherwise of getting milk save from a neighbour - which makes a milch-cow a necessary part of the equipment of almost every household. On the mainland, where the common grazings are contiguous with the inbye, summer grazing of cattle is much easier particularly, as in Crulivig and Linshader, where there are special fences to divide the near and far pastures (cf. the old Norwegian spring-autumn and high summer seters.

[178] We may compare fifteen Sutherland townships, in which 89% of the stock held is sheep, with the Bernera District in which 80% of the total stock is sheep. That this balance of stock is not old-established is revealed by comparison with the stock figures collected for

231 the Napier Commission in 1883; these show that the Bernera region now keeps less than
233 half the former number of full grown cattle beasts but only a slightly higher percentage
311 of sheep. It is an unavoidable conclusion that resettlement and enlargement has not led
632 to greater agricultural efficiency: since it was carried out for social and not economic reasons, this is perhaps not unreasonable, but it augurs ill for the future of a community which must be largely dependent on agriculture.

[178]

Land Use and Cultivation*.

241 Before considering the details of stock management it is well to review land-use, for
[231] cultivation is subsidiary to, and directed at, stock keeping. Few crofts have no culti-

CHAPTER TEN

EAST LOCH ROAG DISTRICT

(Garynahine, Callanish, Breasclete, and Tolsta Chaolis)

GARYNAHINE by Anne Iredale and Jennifer Oxenbury.

131 Garynahine is a townships of twelve crofts which are situated on the eastern arm of
632 Loch Ceann Thulabhig. The crofts nowhere extend more than one-third of a mile from
the coast. There is a hinterland of about 1,800 acres of common grazing, which is
133 mostly about 100 ft above sea-level, though it rises to 200 ft in a few isolated areas; the
crofts are lower, and maximum elevation is 80 ft.

Most of the croft land is drained by the stream Allt Mhurchaidh which flows through
134 all but two of the crofts. But the soils are heavy, and several crofters cut peat on their
crofts. Many crofters complained that their land was too peaty for cultivation.

361 The crofts form a regular pattern beside the south side of the main road from
Stornoway to Breasclete, with two small feus and a 21 acre freeholding on the north side
of the road. In addition there is a farm (Garynahine Lodge) of 400 acres east of the
crofts, and likewise stretching along the south side of the Stornoway road. The main
road to Uig passes through the farm, dividing the cultivated area in the west from the
grazing section.

175 The regular lay-out of the crofts dates from the formation of the township in 1935.
361 On the same site, but long cleared, there had been an older village about the same size
i.e. twelve crofts, known to be in existence in the 1850's. The crofts were in a similar
position, but were a different shape, and the ruins of some of the croft houses still remain.
This village was completely burnt out one gusty winter evening when, it is said, a spark
from a crofter's pipe was blown onto one of the thatched roofs, and the wind quickly spread
the blaze to consume the entire village. The crofters left the area, many going to the
neighbouring township of Callanish; Garynahine then became one large farm until 1935
when the land was re-allocated into crofts. The new crofters came from a variety of
areas, several coming from Crulivig, others from Breasclete and Callanish. The
owners of the farm had also opened an hotel which prospered until 1945 when the farm
was sold to its present owner Admiral Drummond, who has since used the house of a
241 private house. Nine acres of the farm land is cultivated, and the remaining 391 acres
● 311 are used for grazing. In contrast to the usual practice in this area the oats have been
undersown with rye grass. Another beneficial innovation at the farm is the introduction
of shelter belts. Trees have been successfully planted, making it possible to produce
good crops of soft fruits such as raspberries, strawberries etc. Both the crops and
the stock on the farm are of a high standard, showing that with capital and correct
management the land can be remarkably productive.

In contrast to the large scale economy of the farm, the twelve crofts (ten operative units) are each between 4.6 and 6.2 acres, and the total reputed arable is 67.3 acres. In all there are only 9.5 acres under crop (oats 6 acres and potatoes 3.5 acres), and 2.25 acres under sown grass. The crofts are worked either by spade, horse (hire from croft 40 Callanish) or by tractor (hire from the Lodge). The seasonal rhyithm of cultivation and of stock rearing is that in Callanish.

Enquiries soon reveal that crofting is not the main occupation of the croft tenants. Another indication of the declining interest in the land is the fencing of the crofts. All were fenced when they were formed in 1935; since then there has been no refencing. Now a grant is available to pay 75% of the cost of re-fencing but little has been done.

23/ Stock totals (see Appendix C) have declined recently and this trend will probably continue. There are only four cows and two calves in the township (plus six at the farm).

Table 33

	56
	61
	43
	12
	7
	-

Figure 33

361 Contrasting patterns of crofts: the main block of Callanish crofts was lotted before
178 1850. The group of crofts known as Breasclete Park was added in April 1850 for
families evicted from Reef in south Uig. These, and many of the original Callanish
crofts were later subdivided. The irregular shaped crofts in the south of Callanish
were added at later dates, probably originating as squatters on the common pasture.
The Garynahine crofts were formed in 1935; they have a large area of common
pasture south of the farm.

/p. 86/

23/ There is no bull in Garynahine; the Department of Agriculture bull from Callanish is borrowed. Most crofters buy their milk either from the Admiral at the Lodge or from Stornoway whence a dairy delivers daily.

Eight crofters keep sheep; stocks vary between 5 and 30 per holding. Two crofters
233 exceed their scourning (there is no equivalence in Garynahine because there has always
been plenty of pasture). With a total of only 166 sheep and lambs on 1800 acres common
pasture there is no danger of over-grazing.

312 The village has a good piped water supply from Loch Mhurchaidh, and has had elec-
319 tricity since 1954. There are excellent communications: 4 buses a day to Stornoway
444 and also one bus from Uig and one from Bernera passing through Garynahine. These
good communications have probably contributed to the declining interest in crofting.

463 There are only three full-time crofters (two of whom draw war pensions). Of the
remaining 12 adult men permanently resident, 10 have regular or part time work, the
remaining two being to old. Employment is either in Stornoway or at the Lodge. Only
[178] two people do part time weaving. Crofting is rapidly decaying in Garynahine. The
croft land is reverting to rough grazing, and there is no indication of renewed interest
in the land. Instead, life is becoming increasingly orientated towards Stornoway.

CALLANISH by Anne Iredale and Jennifer Oxenbury

172 Callanish must be one of the original settlement sites of the Hebrides, as it boasts
an impressive standing stone circle and two other groups of stones. The stone circle
133 is on a promontory, which projects into East Loch Roag. The promontory rises to about
125 ft, and then the land drops almost to sea-level at the neck (less than half a mile wide)
[361] which joins the promontory to the mainland. The township extends inland for about six
miles in a belt roughly two miles wide. This inland area forms the common grazing;
it is rough hummocky moorland with the general height rising gradually inland; the
highest point is 425 ft.

175 The early crofts were situated close to the stone circle overlooking the Loch. The
area was given to crofters who had been cleared from Linshader in the eighteenth century,
427 and it is said that until the Crofter's Act the Callanish crofters had to return to Linshader
to work for one day a year in return for this grant of land. But later the crofts on the
361 more exposed westward facing side of the promontory were cleared and replaced by the
90 acre Callanish Farm. Some ruins of the croft houses still remain. The crofts then
spread across the low lying neck to the main road from Stornoway to Breasclete, which
now forms the boundary between the croftland and the common pasture. The croftland
241 varies in quality, but it is mainly quite good potential arable. Fertilizer and manure
are extensively used. Seaweed was widely used in the past but in more recent years the
labour of gathering the seaweed has been out-balanced by the lower price of the artificial
fertilizer. The main problem of the crofters is one of drainage, and in some parts the
drainage channels have to be as wide as the strips of cultivation. Croft 29, situated on
a small peninsula from the neck of low lying land, is almost cut off from the mainland
at high tide.

The croft houses were then in two nuclei; one on each side of the narrow neck. Much
175 later a third nuclei developed, known as Callanish New Park, further north along the
361 Stornoway road, formed by evicted crofters from Bernera; they had put to sea in small
427 boats with their belongings, and they happened to land at this point. They first became
squatters on the common grazing but later gained crofter status.

There are 47 crofts in Callanish which vary in size from 2 acres to 9.7 acres. Some
427 of the larger crofts are a result of private enterprise; the crofters have, without any

CHAPTER ELEVEN

THE CARLOWAY DISTRICT

by

Brian Loughbrough

131 The seven crofting townships of Upper Carloway, (including Carloway Park), Borrowston,
133 Garenin, Knock Carloway, Dun Carloway and Kirivick form a compact area of land in the
north of the Parish of Uig bordering the coast and Loch Carloway. Here the Lewisian
103 gneiss has a thin discontinuous covering of glacial drift which is most extensively
developed immediately above the head of Loch Carloway. Three valleys help to deter -
361 mine the layout of the townships and settlements (figure 37). The townships to the north-
west of the Carloway river are found on more gentle slopes than those to the south east
133 where the slopes are less uniform and are less uniform and are often broken by short
steep rocky faces. The north western area therefore offers an environment where almost
continuous cultivation is possible whereas in the south east the frequent rock outcrops
have led to fragmented cultivation on minute plots which are inaccessible to the tractor
or other mechanised implements.

131 The soils are heavy and acid even on the skinned land of the boulder clay slopes nor
is there any machair to mitigate the acidity of the peaty areas which descend almost to
the shores. Only in one place is there any trace of the influence of the sand and this is
to be found where the crofts numbered 1 to 3 Garenin border the small bay in the north of
that township. Here the fierce gales have blown some of the finer beach deposits on to
the croft land.

Much of the peat has been cut from the inner common pastures except in the case of
Upper Garloway where active cutting is still taking place in the valley whose flanks are
occupied by squatter settlements, to the east of the football pitch. On the common
131 pasture the vegetation varies from peat moss and heather with bracken to fescue and
311 close turf on the skinned land by the road to Dalemore. On the upper common pasture
heather and bracken have increased since the abandonment of the shielings and the
reduction of the cattle stock; many inhabitants remember that the hills once had a much
greener aspect. Nor is this a feature confined to the common pastures; on one croft in
Upper Carloway 1.9 acres are completely covered by heather whilst a neighbouring croft
has a good crop of oats on similar land. At the loch in both Knock and Upper Carloway
areas of former arable land have reverted to moss, the old lazy beds being picked out by
lines of reeds.

361 Settlement. The settlement pattern is one of great interest for it shows in a clear way
the effects of the distrinct phases in the historical geography of the area. The evidence
of success and failure stands side by side. Before attempting to justify this assertion it
is necessary to give a brief account of the physical evolution and distribution of settle-
ment.

361 The origin of permanent settlement is believed * to have been the permanent occu-
175 pation of shielings used by people from Bernera until the eighteenth century. Until about
1850 arable land was held run-rig and the houses were huddled together in tight little
clusters. When individual crofts were lotted, about 1850, the houses werescattered,
each on its croft and generally up to fifty yards from the present road (which was then
361 no more than a rough track). Sea access was then most important but since the advent
149 of modern road transport new houses have been built nearer to the roads, producing the
178 modern markedly linear plan. The roads extend at different heights across the slopes

* based on information supplied by Mr Macleod of 27 Garenin.

Month	General	Land	Cattle	Sheep
January and February	Preparation of land. Ditching.		In byres - out on fine days.	On crofts and inner common pasture.
March		Ploughing and manuring.	On crofts and inner common pasture.	FANK - dipping. Put on outer common pasture.
April	Peat cutting.	Sowing oats. Sowing potatoes. Cleaning potatoes.	Sales.	
May	Lifting peat.			
June	Peat taken to roads.	Cultivating.		
July	Little croft work until late in July or early August.	Hay cutting and drying.		
August	Bringing home peat.	Oats cut and dried.		FANKS - for shearing and weaning.
September		Grain and hay brought to stack enclosure and byre.	Sales.	
October		Lifting the potatoes.	Cattle brought into byres.	Brought to crofts and inner common pasture. Dipping and tupping.
November and December	Little croft work.		Feeding in byres; outside when possible.

368 ground. Some of these provide for a much larger area and indeed the policeman serves the whole of the parish of Uig. Three buses per day in each direction operating on a circular route provide transport to Stornoway.

UPPER CARLOWAY

427 133 The township comprises 51 registered crofts and 28 feus and allotments which are situated on the drift covered slope which rises from the head of Loch Carloway. The crofts are each about half a mile in length and from 5 to 25 yards in width aligned up and downslope. The lowest portion of the croftland is just above sea level and the highest approaches 225 feet O.D. The key crofts are numbers 30 and 31 whose boundaries come to a point thus enabling the crofts to be accommodated on the arcuate hill face. In the east are the crofts of Park Carloway which were lotted at a later date than the main area of croftland (numbers 1 to 40).

Only two crofts are fragmented ('fixed runrig'), these occupy lowlying hummocky land near the river where fencing would be difficult. Elsewhere fencing has been almost completed between the roads, but above the upper road fencing is less common, usually only being undertaken by the more enterprising crofters with more promising land; the bare rock surface of crofts 9 and 10 precludes any such attempt there. Almost all the fencing has taken place since 1946.

427 ● 311 The 51 crofts and 28 feus and allotments are operated in 56 working agricultural units. The total land reputed arable 134.4 acres and the outrun 82.65 acres which gives a total of 217.05 acres of individually held ('croft') land. The method of working is controlled by the relationship of slope, soil and elevation. Three zones may be distinguished, namely

(1) Below the road;
   a) well drained and fairly accessible,
   b) poorly drained and often far from the croft house
(2) Between the roads: a main zone of cultivation
(3) Above the main road an upper zone
   a) with bare rock and thin soil
   b) drift covered - similar in character to (2), but more exposed

Crofts 1 - 32 occupy all three zones
" 33 - 40 and 46 occupy zones (2) and (3)
" 49 is in zone (2)
" 41 and 42 are in zone (1)a and are in 'fixed runrig'.

241 [407] In nearly all parts of these zones it is possible to use a tractor and so the cultivation of oats and cutting of hay is accomplished. It is usual to work the potatoes by horse, but only one man preferred to do all his ploughing by horse. This widespread use of the tractor is in marked contrast to the townships southeast of the Loch where it is almost impossible to use the tractor in many places. The significance of this in the contrasts in methods and efficiency need hardly be emphasised.

461 Life in a crofting township is governed by a very distinctive pattern of working that is so strong that it even influences the operations of the mills in Stornoway, for each crofter, if he continues to work his croft fully, must take time off for the communal operations such as the shearing or dipping of the sheep and inevitably at certain times of the year he will be anxious to work the croft. The table attempts to set out the pattern of the agricultural year in this group of townships (Figure 40).

427 authority, simply moved their fences and enclosed part of the common grazing. For
311 example the crofter at 37, instead of having only the 6.7 acres of the croft has now almost
10 acres of land, of which the remaining 3 acres have been 'acquired' by enclosing part of
195 the adjacent common pasture. Some of the crofts are in two or three pieces, and in some
cases this came about in the late nineteenth century when the proprietor's wife, Lady
311 Matheson objected to the position of some of the croft houses because they were too close
427 to the standing stones. Croft houses 25 and 26, then near the stones, were moved to the
other side of the village and given parts of crofts 1 and 2 for their houses. Crofts 1 and
2 were given parts of crofts 25 and 26 as compensation for the parts of their crofts they
had lost. Croft 27 also lost part of its croftland close to the stones so that an enclosure
could be made around the stones. About the same period, before the passing of the
Crofter's Act (1886), when the village was still 'ruled' by the township constable, and
several other changes took place. Croft 27 and 28 used to be where the croft houses are
at present and the surrounding adjacent area only; but it is said that the tenants of these
two houses, being influential with the constable, obtained part of Callanish Farm. Simi-
larly the tenants of crofts 30, 31 and 35 divided part of croft 19; these changes have
become permanent. The most recently formed croft was taken from the common pasture
in 1890. Since then three feus have been created, but two of these are holiday houses and
the third has only 0.5 acres of land.

241 There are 36 working croft units with a total of 134.4 acres reputed arable. All but
4 croft units grow oats, and there are 20 acres under oats (appendix C). Of the
remaining cultivated land 9 acres are potatoes and 5 acres sown hay. Most of the
land is cultivated by tractor; there are 6 tractors in the township. In the past there
were several horses but now there is only one. Five crofters still cultivate by spade.
The crops are sown in April, and the hay is usually harvested in August and the oats a
month later according to the weather.

231 Thirty-one cows, six heifers and 25 calves are kept in the township and tethered most
of the year on the crofts. It is usual for the crofters without a cow to graze one of their
neighbour's cows for part of the year in exchange for milk. There is a beef-type short-
horn bull belonging to the Department of Agriculture, which is kept on Callanish Farm.

233 The 5,302 acres of common pasture support an individually owned stock of 904 sheep
311 and 561 lambs. Several crofters exceed their souming, but there is no shortage of
grazing. Some of the sheep graze on Garynahine township pasture. Callanish also has
the use of the pasture on Orasay island; each year some of the sheep (one sheep or ram
221 per croft) are taken across by boat for a period. The breeding ewes are brought in for
233 tupping on November 14th, after the harvest is complete, and lambing takes place in
April. The crofters open their gates for winter grazing from November 1st to May 10th;
in addition Callanish Farm (which has no sheep) is open for winter grazing. The sheep
are sheared in July, and the lambs are taken from the ewes a month later. The lambs
are dipped in November and the other sheep in December. Shielings at Flodavat are
known to have been in use until 1921.

491 Communications are quite good; the village is close to a main road to Stornoway, and
131 there are four buses a day. But within the village itself many of the so-called roads are
merely rough tracks, and one croft, number 29, is inaccessible by motor vehicle; it is
491 over a mile from the nearest track, separated from it by rough peat land. This year a
grant from the council was made towards the cost of construction of a road to this croft;
but several of the Callanish crofters who cut peat on the intervening land refused to allow
a road to be built; and so croft 29 is still almost cut off from the rest of the village.
131 There are two shops in Callanish (one with a petrol pump); grocery, butchers' and fish
366 vans deliver frequently. Callanish also has a stone jetty which in the past was important.
504 There was a ferry for mail and passengers from here across to Uig and Bernera calling
at Linshader, which gradually declined in importance until the 1920s when it ceased to
505 call at Linshader. The ferry to Bernera finally ceased in 1940 when the ferryman (who
lived at Callanish Farm) left for war service. After this the jetty was still used by small
private boats (e.g. Callanish church serves Linshader, and many people came to church
by boat until recently), but gradually it has fallen into disuse.

312 There is no piped water supply and after even a short period of dry weather there is a
water shortage. One prosperous crofter (where the crofter does weaving and one member
of the family is periodically away with a Norwegian whaling fleet) bought a large modern
Bendix electric washer only to find that there was not sufficient water to use it except on
[354] rare occasions. The croft houses have had electricity since 1954, and even the three
remaining inhabited thatched houses now have electricity.

311 Although there are only 4 full-time crofters, most of the crofts are carefully and well
worked. Only a few crofts are decaying, and there is a tendency for these to be sub-let
to the more agriculturally inclined crofters instead of allowing the land to revert. In
[288] addition to the full-time crofters, 31 other men do part-time crofting. Eighteen men
weave and this provides their main income, but this figure fluctuates according to the
prosperity of the Harris Tweed industry; at present the figure is probably higher than
[166] average. Although 32 people have emigrated from the township since 1939 (many of them
[161] young people who have married on the mainland), there are still several young people and
[162] young families making their homes here. The dominant age-group of permanently resi-
dent adults is 15 to 44. Total population is steadily declining, but Callanish has always
been a prosperous area and seems likely to remain among the more prosperous crofting
communities.

BREASCLETE PARK by Margaret Grice and Doreen J. Phillips.

195 Breasclete Park, also known as New Park, Callanish, was settled by people cleared
427 from Reef in the mid 19th century. Two of the six original crofts have been subdivided,
making nine. However, there are only five working units and on one there is no culti-
vation. There is also a feu house built in 1958.

361 The crofts, which are fenced, form broad strips perpendicular to the Breasclete-
241 Callanish road. Cultivation is mainly by tractor, oats, potatoes and some clover being
grown. One progressive crofter has successfully experimented with re-seeding one
231 acre of grazing land on his own croft. Common pasture for the 148 sheep and 6 cattle
is shared with Callanish, and for most purposes the Park can be considered a part of
that township.

162 The total population is 26 of which 4 are permanently away. There are 6 people over
65, and 8 children under 15.

BREASCLETE by Margaret Grice and Doreen J. Phillips.

131 Breasclete is situated on the east side of East Loch Roag on land which rises gently
133 from the seashore to the moorland and is interrupted by rocky outcrops of gneiss in the
northern part. It is separated from the township of Callanish to the south, by a small
westerly flowing stream, at the mouth of which is the site of a mill.

491 The road on which most of the houses are situated, follows a curve through the
361 middle of the crofts, but newer houses and some feus have been built along the main
Callanish-Cartoway road, nearer to the shore. Stornoway is 18 miles away along this
road which is turned throughout. Breasclete could be served by the still unfinished
Pentland Road, were it to be properly surfaced and this would make the journey shorter
[491] by 4 miles. Two buses in each direction per day connect the township to Stornoway, but
high fares make visits to the town infrequent.

312 The township hopes to receive the mains water supply within the next few years, but,
at the moment, relies on wells within easy access of most of the houses. Many houses
have piped water from private wells, some of which go dry after two or three days good
weather although the wells on the lower ground never fail.

Since 1939,
166 54 people have emigrated whereas only 4 have immigrated. Most of the girls have to
462 leave home when they finish school as there is no employment locally. Many of them go into domestic service or nursing in Glasgow. Many of the younger men also spend time away from home, often in the Merchant Navy. Breasclete is also the temporary home of the families of lighthousemen on duty in the Flannan Isles.

288 Although the people live and work on the croft, weaving the Harris Tweed provides the main source of income. This is a rather irregular occupation owing to the uncertain demand for the tweed, and although the men are nominally self-employed they rely on the mills to supply them with work. The tweed is woven on treadle looms, which, with ancillary equipment such as bobbin winders, are all owned by the crofters.

[458] As 1959 was a good year for the tweed industry, there was an air of prosperity in the township, and with the aid of government housing grants many new bungalows were being erected. But should there be a slump, the crofts would be unable to support the population and most of the bread-winners will have to leave.

TOLSTA CHAOLAIS by Roger H. Thomas.

131 The township of Tolsta Chaolais lies in a shallow glaciated depression occupied by Loch
133 a' Bhaile and Loch Shader. Most of the crofts are situated near the shore of these lochs,
361 for westwards to the sea the terrain is too rocky and irregular for either settlement or cultivation, whilst to the east of Loch a' Bhaile the land slopes precipitously from 250 ft. to the loch shore. As Figure 36 shows settlement takes advantage of the more gentle drift-covered slopes, generally of small extent.

137 Cultivation is very noticeably limited to three areas - along the west shore of Loch
[241] a' Bhaile, along the north-east shore of Loch Shader, and in the valley of the small stream draining from the north into the head of Loch a' Bhaile. Most of the croft land is composed of rock outcrops, rarely exceeding 100 ft. in height, separated by damp depressions frequently filled by reeds and rushes; bracken was apparent only on three crofts. In particular, the area between the two lochs is badly in need of draining and is largely colonised by reeds and very coarse grasses, of no use whatsoever as pasture. One enterprising person suggested that the township should hire a ditching machine - this could certainly be put to use with great advantage.

632 The settlement comprises 43 registered crofts, 6 feus, 2 squatters, 1 cottar, and
311 2 holiday bungalows, with the croft holdings aligned north-east/south-west between the
427 two lochs and the sea, except for nos. 28 and 29. The 53 holdings are unofficially amalgamated in various ways and so reduced to 35 operative agricultural units. The acreage of crofts varies from 2.2 to 20.75 acres - a considerable variation. Fencing of the crofts - except for 1A, B, and C, and 12A, B, and C which are held 'run-rig' - was carried out between 1945 and 1950, whilst in 1946 the common pasture of 2,700 acres was fenced into two parks - an inner and an outer one, the division coinciding with the Carloway to Breasclete road. An area stretching from crofts 18A to 21 has, however, been most haphazardly divided. The seaward halves of some five crofts were redivided amongst seventeen crofts in the southern half of the township to compensate them for lack of grazing area within their own croft boundaries. This division is said to date from about 1886.

241 Most of the cultivation is carried out with hired tractor, although two crofts owned
[467] small mechanical cultivators. Ploughing by tractor and horse, as opposed to spade cultivation, depends either on the urgency of the operation, or on the accessibility of the plot, for any small patches of cultivation on the rougher terrain are dug by spade, as

permanent grass. The pre-eminence of the Carloway area is then only a relative one where the decline in cultivation is taking place at a slower rate. Isolation, the decline in fishing and the lack of alternative employment leading to a greater decline in population may explain the more rapid decline in the Valtos area. Whether Carloway will see a similar decline remains to be seen.

Table 35

Stock carried as a proportion of total soum of each township - Carloway district, August 1959

TOWNSHIP	All Stock	Cattle	Sheep*
Carloway	63%	53%	70%
Carloway Park	87%	64%	119%
Borrowston	74%	15%	121%
Garenin	97%	30%	160%
Knock Carloway	64%	30%	90%
Kirivick	73%	25%	124%
Dun Carloway	104%	21%	187%

* As recorded in some cases these figures are too low (see Appendix C (2)); the maximum error is probably around 10%.

Table 35 summarises the agricultural system; further details of the relations between size of unit, status of tenant, stock of cultivation, will be found in Appendix C (3), (4), (5) and (6). Though the total soumings (that is the conversion of both cattle and sheep units to 'cow units' expressed as a percentage of the souming) never fall below 60% the sheep souming is exceeded in five townships and that grossly in two cases. Once again however this is not as serious as it is in the Valtos area where soumings are exceeded by up to three times the figure allowed. Nor does the mere statistical analysis reveal all the picture for it is essential that a proportionate number of cattle be kept so that the grazing of both cattle and sheep may regulate the growth of the grass. As it is, the relative and absolute increase in the numbers of sheep is having a serious effect on the quality of the pastures.

Sheep are given less attention that the cattle whether they need it or not and few of the present generation are prepared to tolerate the life of the shieling in its old form where the cattle were taken in the summer. In consequence the grazing on the outer moor is almost entirely given up to sheep. The shielings are now only marked by small broken stone mounds which were once the shelters and by the small surrounding areas of greener sward. The changing aspect of the hill landscape has already been mentioned.

Comparison of the totals given in Appendix C (1) shows how the present pattern is developing. 167 milk cows are being raised on 171 agricultural units and with these are 113 calves. Appendixes C (5) and C (6) indicate that the agricultural unit farming the basis of farming is the single milk cow and annual calf which carries a subsidy if it passes the inspector of the Department of Agriculture. A few crofters are raising young beasts for sale but there is a general unwillingness to grow more fodder to raise cattle for an uncertain market which may be affected at any moment by an increase in transport costs which are already high. Without the subsidy such enterprises would hardly be possible at all and indeed one could say this of many aspects of life in the island today. Some of the calves are wintered, but the usual practice is to sell off late in the year.

Notes: (a) The total areas of common and inbye land for each township are given in the text.

(b) Croft holdings include duplicate tenancies; other holdings include de facto holdings such as cottars and squatters if carrying crops or stock; effective agricultural units include only holdings with at least a cow, or five sheep, or half an acre of cultivation; duplicate tenancies and privately sub-let crofts are not counted twice.

(c) Soumings have been calculated according to the rent operative at the date when the regulations were made unless some other date is specified.

(d) Additional sheep figures are given in Appendix C(2).

The Crofting Structure Re-organised

	(a) Holdings	Proportion of holdings grouped according to area of arable land: 0 - 5 acres	5 - 10 acres	10 - 50 acres	All holdings
142 / 311	District				
631	South Uig	43%	34%	15%	100% (195)
632	Bernera	14%	57%	29%	100% (109)
423	East Loch Roag	53%	28%	9%	100% (172)
944	Carloway	72%	22%	5%	100% (155)
	WHOLE PARISH	50%	25%	16%	100% (629)

Note: These are the registered crofts and similar agricultural tenancies as on the 1958 valuation roll. About 50 holdings omitted for lack of data.

(b) Effective agricultural units	Proportion of units grouped according to 0 - 5 acres	5 - 10 acres	10 - 50 acres	All units
District				
South Uig	33%	34%	33%	100% (145)
Bernera	15%	32%	53%	100% (168)
East Loch Roag	35%	30%	35%	100% (130)
Carloway	61%	30%	10%	100% (155)
WHOLE PARISH	30%	32%	38%	100% (555)

Note: About 20 units omitted for lack of data.

(c) Summary (excluding Carloway, see note)	Proportion of holdings (generally registered crofts):	Proportion of effective agricultural units:
Under 8 acres	72%	47%
8 acres and over	28%	53%
All holdings/units	100% (474)	100% (400)

Note: The Carloway district is here excluded because about 30 small in-lairs (registered units without another status attached) have the effect of inefficient amalgamation of crofter-tenancies.

Sources: Appendices A(5) and (4) and C(3) and (4).

CHAPTER TWELVE

AGRICULTURE IN A CROFTING PARISH

by

H. A. Moisley

427 / 311 / 631

The agricultural economy of Uig parish, as of the Hebrides in general, is rightly controlled by three sets of factors - physical conditions, the system of crofting land tenure, and economic circumstances. The first two have already been discussed in Part I. In particular, it has been shown that the crofting system, as at present operated, puts much more land into the hands of agricultural units than the size of the land, which is in fact the only asset initially conceded, whilst forcing crofters who could be efficient agents of agricultural production are inhibited by the small size of their holdings and that inability to sufficiently enlarge them. (See Chap. III, p. 35, and appendices to the district accounts, especially A(5), A(5), C(3) and C(5)).

The crofting system re-organised.

There are 699 agricultural holdings on the 1958 valuation roll, of these only 23 are neither subsidiary crofts nor holdings of similar status (see Table 37, p. 121). About half these holdings have less than 5 acres of arable land, and 19% have less than 2.5 acres. Only 16% have more than 10 acres of arable land. Some of the Carloway district (73% less than 5 acres) and, to a slightly less extent, of East Loch Roag district (42% less than 5 acres). Relatively large holdings are most important in the Bernera district (59% greater than 10 acres). In South Uig despite the large number of holdings formed within the present century, only 15% of all holdings exceed 10 acres, (c.f. Carloway: 9%). Data on the size distribution of holdings are given in appendices A(5) and C(3), and are summarised in Table 37(a).

Although still illegal at the time of our survey, it is now permissible for crofting-letting to extend by practice, and in fact, some tenancies have formed, as described in Chap. III. Legally, there is a distinction between 'holdings', which are generally tenancies of different size, and 'working units', which may include several holdings. The latter are potential units of agricultural production and are generally larger than the holdings.

However, the structure of potential agricultural units is not the product of one process alone. Amalgamation is important but so also, in certain districts, is 'sub-division', a process which tends to reverse the development of larger agricultural units. By 'sub-division' is meant not only the unofficial sharing of crofts by divorced members, which still happens but is no longer very significant, but also the formal creation of small holdings. Crofters, as we have disclosure are, nowadays, generally subject to the approval of the township committee and of the factor, some may even have a few charters; nevertheless they are the contemporary representation of the age-old custom of squatting on common land, a process which increased the number of crofts in some areas in the course of the nineteenth century. (Chap. III, page 7). Such holdings are here classified as 'working units' provided that they carried either a cow, or at least five sheep, or more than a quarter acre of cultivation, including hay.

Finally, since a proportion of the 'working units' (potential units of agricultural production) are not actually put into cultivation, we must distinguish between them and the actual units of agricultural production, here termed 'effective agricultural units'. We accounted for 589 of these, (page 30). Their distribution by districts, according to the acreage of the units, is shown in Table 37(b). Comparison of tables (a) and (b) demonstrates the effect of unofficial re-organisation of the crofting structure. In particular, Carloway excepted, the proportion of units of less than 5 acres is reduced in practice from 72% to 47%, and the proportion of units of more than 10 acres is increased from 18% to 38%. The crofting amalgamation is masked by sub-division, the effect of unofficial re-organisation of crofter-tenancies.

233 (C)(i) and the cattle enorm appear impossibly high unless large quantities of winter fodder
311 are imported. In the old township the enorm of each croft are still based on minimum
631 rights of pasture on the traditional "1 cow and follower and sheep per pound rent": the croft
178 however, were assessed on the potential value of the croft in days when an inshareable
(627) share was available for production of winter fodder for the croft in days when an inshareable share was available for production of winter fodder for cattle. This is no longer the case and the assumption no longer holds.

Township pastures are seldom, if ever, used to best advantage. Because the regulations generally allow unlimited stocking, the proportion of sheep for cattle, the number of sheep, in theory, exceeded by the proportion of sheep for cattle. The stocking rate is not in practice, however, the situation is quite different. Much of the increase flock of sheep is not used for the efficacy of the grazing of sheep and cattle. As the first place the difference between the theoretical discussion of crofters remained the sheep and cattle is not well appreciated, as the appearance of some crofters remained the sheep and cattle is not well appreciated, as the appearance of some crofters remained the sheep and cattle in the days of the present century in the black" - but the crofter's attitude to sheep and cattle in the days of the present century in the There can be no doubt that the attitude of the crofter when I was a boy, now they are parish except that, whereas sheep stocks have remained fairly uniform, the cattle stocks have grown and the quality have improved or have resisted, in the

The decline of cattle numbers has been in the same way as the rise of the human population and this, together with the much lower sheepcattle ratio on crofting township than on farms in 1879, shows that sheep are not so to-day, the object of crofting township was subsistence rather than commerce. The increase in sheep stocks on the other hand is probably no more than a reflection of increasing disregard of the soumings.

If we compare the cattle and sheep stocks with the soumings shown in Table 38 and Appendix E we find that 80 years ago, except in Bernera, there were no significant differences between stock and soum. Today the cattle stocks are around one-third of the agreement and the soum whereas sheep stocks are still roughly in agreement. Grazing is allowed by crofting law in question their validity is in question. Examination of the stocks and soumings leads one to question their validity in many cases. Examination of the stocks and bear no regular relation to the available area of common pastures (Appendices A(i) and

233 Sheep are needed to maintain the flock because casualties, from disease and accidents,
311 are heavy. Wethers are also kept, until they are two or three years old, when there
631 are enough for the pot. Again, after allowing for casualties and some consumption, there is no surplus for sale in generally small, scrag sheep. The
178 exceptionally well-managed flock of Carloway, which has a reputation for being the best
(628) in Lewis, is almost alone, one man, today, being almost the only crofter who breeds out his own ewe lamb. This is certain that, allowed with pride the possession of a fifteen-
year-old stock of sheep yield an economic return to the crofter-shepherd. Nevertheless, very few of
the ideal arrangement would be to replace the 500 little individuals here spoken of, with
"commercially-minded" crofters, such with a yield equivalent, say, only about 50
certainly be financially more rewarding but would be regarded by many people. This yield almost
because so many crofters are deeply attached to their small packs of sheep.

TABLE 41

Stock carried (as a proportion of soum) according to size of units

TABLE 44

Principal croft workers by districts

employment and, as we shall see, in most cases, the croft carries so little stock that it cannot be the most important source of income.

This situation does not vary very much from district to district (Table 44), except that South Uig has a somewhat high in between Bernera and Carloway, a different picture emerges in the Bernera district. Here, the croft carries so little stock that it is probably a reflection of the very large structure of the crofting workers. There is no indication of a large number of employment opportunities in the district which, in turn, is also reflected in the smaller proportion of casualties there and consequent larger proportion which enter on casual employment as shown in Table 44.

Finally, we may enquire whether the size of agricultural unit available to a man has any influence on his employment status. To this end status has been plotted against size of unit; the result (Table 45)does not suggest that the possession of a large agricultural unit, indeed, the possession of a large unit, still up to 30 acres, is a full-time rather than a spare-time agriculturalist. Lack of marriage, death, or infertility, rather than a matter of initiative, is the main reason why a man is unable to work the smaller, rather than the larger, crofts.

The cultivated land

The chief crops are hay, oats and potatoes, in that order:

DISTRICT	Oats	Potatoes	Hay	All Crops Average per unit
South Uig	149	50	209	407 2.5
Bernera	121	38	69	228 2.0
East Loch Roag	83	35	170	288 2.1
Carloway	113	42	202	357 2.2
TOTAL	466	165	650	1,280 2.2

Barley, which in the form of bere was important until the 1920's, has almost disappeared. Turnips, marigolds, rape and other animal feed crops are only grown

(b) Further depopulation is possible but is not necessarily bad. The special
(c) and crofting tenure have resulted in a township structure which is not the most
(d) suitable for modern farming circumstances. The land is in many
(e) productive than it was 80 years ago, the crofting population is much
(f) smaller and the number of cattle and sheep is much smaller, yet, in
(g) there is increase the proportion of their income derived from agriculture. Some
(h) of the crofters have benefited from the decline of their township
(i) rate and the large extent of depopulation could be controlled, the
(j) assessment of the capabilities of the district over study.

(k) It is not realistic to plan for any extensive development of industry
(l) for the district. Lewis is suitable for the development
(m) of industry - the phenomenal growth of the Hebrides
(n) to get industrialists to invest in inland Scotland there
(o) hope in Lewis. Tourism is a possibility but hardly
(p) and industry is limited to the Stornoway area. Tourism
(q) power, nor is it desirable, but it is not helpful, either
(r) if there is to be any value to the district it should
(s) be given to the other value of development it must come
(t) to depend on it. It follows, that development
(u) lease, the only basis of the future of the crofting
(v) dependence on casual or seasonal employment, and
(w) only, can not prevent the decline, but a truly
(x) useful outlet for some younger folk. On the

at Carloway Bridge. In addition to the main settlement which is irregularly disposed on either side of the two roads, a group of Swedish timber Council houses has been built in a somewhat forbidding situation on the common pasture adjoining the 'Pentland' road.

The thirty three registered crofts and thirteen feus or allotments (of which only five are non-agricultural) are worked in thirty four units. Three of the tenants of the Swedish houses have crofts, two in Knock Carloway and one in Upper Carloway.

The land use figures show that Knock Carloway has a much greater percentage of permanent grass than has Borrowston on the opposite shore of the loch. These figures reflect not only the less rewarding physical environment on the south shore, but also the lower intensity of cultivation which bears a direct relationship to the type, number and quality of the stock. The township has less than the total number of animals permitted by the souming though the higher figure for sheep than cattle reflects the general trend for the area. No horses are kept but the township has the bull which serves the area - a privately owned beef-shorthorn.

Weaving remains the major occupation but the emphasis is less heavy than in the other townships for the community services centred here employ a number of the inhabitants. It may be that here lies part of the answer to the problems of the community as a whole: but even if employment in services were to be increased it could never be very significant in a district with a total population of only 600.

KIRIVICK

Adjoining Knock Carloway is the small township of Kirivick which has forty one permanent residents. It occupies the least rewarding agricultural environment of the area. Crofts 1 to 13 rise from the shore of Loch Carloway on the broken hill face to the Carloway-Breasclete road, whilst number 14 occupies the head of a small valley which was once part of the common pasture beyond the road.

The houses are set back from the road occasionally sheltering in the lee of the frequent knolls of bare rock which are exposed on the croft land. These rock surfaces together with the irregular deposition of the drift account for the fragmentation of the cultivated strips in small hand-dug lazy beds on the upper parts of the crofts inaccessible to the tractor.

There are fourteen crofts, three feus and one squatter settlement and all but two of these are fenced. Two of the crofts are held in 'fixed runrig' and the small sections in which the land is cultivated are shown in figure 41 which also illustrates the regular distribution of sections between the two. Though it used to be the normal practice the crofts are not now open to common grazing in the winter.

The restricted amount of land available for common grazing ensured the continued use of the shielings until 1939; small patches were cultivated on the common grazing about forty years ago and this fact too is the only recorded instance of a practice that was a community by the size of the working unit and the land available. At the moment there is no proposal for reseeding of any part of the common pasture* because of the difficulty of getting access for tractors. As in the case of Knock Carloway the total souming is not exceeded, but the sheep stock is 25% above the sheep soum.

The population figures emphasise the problem of the whole of this southern area and here is the most extreme case of incipient decline. There are two fulltime crofters, six crofters who weave and five crofters over sixty five. Seventy per cent of the population is over 45 and only two children attend the school neither of whom is likely to take up crofting.

1. [Figure 42--Analyst]

DUN CARLOWAY

361 Dun Carloway though clearly of a similar type to the other townships south of Loch
427 Carloway has certain features peculiar to itself. The croft land may be divided into two sections; crofts 18 to 23 occupy the deep trench which extends from the Dun Carloway school to Loch Carloway itself. These holdings are larger than the average discussed above and are divided in broad rectangular block. To the west there is a less deeply entrenched zone where the crofts are long and narrow lying up and down slope like those
241 of Borrowston. Short steep and narrow lazy beds characterise the cultivation which follows the pattern set in the other townships, although the areas, as has been noted above, are much larger in some cases; the largest have up to twenty acres. Despite this increased size no croft has more than two acres of oats. The low percentage of land under cultivation is only in part explained by the difficult nature of the ground and
461 the limited use which can be made of the tractor. Few crofters are willing to attempt
[288] more cultivation (to provide extra feed for store cattle or some other form of stock enterprise) so long as the income from weaving is satisfactory. The concept of the croft as an ancilliary employment appears to have defeated its own object, for with the population at its present level, and with the income from weaving as it is, very few crofters are prepared to do more than provide milk for the family, (with the annual cow and calf subsidies, and the proceeds of the sale of the annual calf as by-products) and to derive what income Providence rather than goodmanagement may allow from the sheep.

427 The total area of individually held croftland is 194 acres which is worked in twenty
311 five agricultural units derived from twenty six crofts, nine feus, one 'free gift' holding and one squatter. The cultivation is accomplished by one horse and one tractor, each to which is owned within the township.

The total souming is exceeded, the main reason for this being the gross overstocking
311 of sheep; 187.4% of the soum. This overstocking cannot fail to have a harmful effect on the common pasture, promoting an increase in the bracken already visible on some of the croftland itself, under-nourishment and disease. The poor quality of the hill pasture is brought home by a comparison with the grazings of North Uist where the most striking feature of the landscape is its greenness after the heavier browns of Western Lewis. Regeneration by surface seeding would certainly be helpful here.

SUMMARY AND CONCLUSIONS

128 The tables given in appendices C and D form the basis for much of the comment in the preceding pages. They must now be considered in the light of the general tendencies which they illustrate in the changing livestock economy units.

241 Appendix C (1) elucidates the working of the crofts. The picture is somewhat com-
311 plicated by the large number of non-crofting holdings in the area, of which 43 carry
231 stock (a quarter of these sublet croftlapd). The number of feus also tends to mask the process of amalgamation of crofts to form larger working units; a process which has
423 been taking place for some time. There are in this connection one or two cases of the
427 cross working of crofts between individuals in neighbouring townships. The figures for these units have been included with those of the township where the tenant is resident.

241 Oats are the most important arable crop. The acreages of sown grass for hay and pasture are much lower in comparison. Permanent grass, mostly old arable land, is to be found on 52% of the total area of land occupied as crofts and feus. A large proportion of this is on very thin soil where bare rock is exposed and on wet land, but even so it does show that much more of the land might be under cultivation or improved grass.
[118] The decrease in cultivation since the late nineteenth century is probably much less than that for the Valtos area of South Uig where about 70% of the inbye and outrun is under

or summer pastures for the tenants of Laxay and Barnish respectively, townships on the north shores of the loch. In 1775, there were four tenants in Kershader, but their place of origin is unknown. In 1805, five tenants are recorded, two of them from Uig; by 1824 there were 10 tenants. Thus the growth of population in Lewis during the second half of the eighteenth century may well have been the major reason for the colonisation of one of the least agriculturally attractive districts of the island.

From Figure 1, which shows most of the thirty-four occupied places south of Loch Shell about 1828, it is evident that colonisation had extended south into the mountainous area. The evictions, which commenced in Harris in 1816, may have increased the population already there as early as 1660, for many of these families came from Harris. The numerous shielings in South Park speak of a vigorous community: it is possible that South Park was more densely populated than the northern area up till 1800.

162
175
361
311
161

During the period 1818 to 1842, when the grazier, Donald Stewart, and his brothers had a lease of South Park, most of these settlements were cleared (Fig 2): in addition, between 1838 and 1843, 68 tenants and sub-tenants in Shieldernish, Cleiter, Seaforthhead, Lemreway, Oronsay, Stiomrabagh and Isginn were removed, in all about 436 people.[1] Some 27 families were sent to Crossbost in North Lochs; others went to Tolsta and Tong in Stornoway parish, and some emigrated. The main body of those evicted settled in the townships in North Park: Marivig in 1838 had 6 tenants; by 1850, 22 are recorded. Thus the present distribution of population crystallised about 1840 and by then the townships along the shore of Loch Erisort from Habost to Garyvard were well established. The Minch coast townships from Cromore to Gravir, first settled about 1800, were greatly expanded, and Park south of Gravir became a sheep grazing devoid of small tenantry.

In 1844, the Seaforth family, which had held Lewis for over two centuries, sold the island to Sir James Matheson. The estate management soon wrought great changes in the landscape. Until 1850-52, the run-rig system prevailed, a system whereby a group of joint tenants, or a tacksman and subtenants, cultivated in small patches what arable land had been reclaimed, each share being periodically re-allocated. The crofts, or individually held land, date from 1850-52, when the land was lotted and most of the present crofts were formed at this period. The settlement pattern associated with run-rig was one of closely nucleated groups of houses but when run-rig was abolished, houses were built on the individual crofts.

In 1858, Lemreway was once again made available to crofters, most of whom came from the fishing townships where population pressure was building up. After the disastrous potato famine of 1846-7, and the final failure of the kelp industry from 1840 to 1844, the population of the Outer Isles experienced great hardship. [illegible] the early 1850's, the lotting of the crofts and the rapid development of the fishing industr[illegible]ught a period of prosperity and the population grew rapidly especially in the fishing townships [illegible]e Minch coast. The prosperity was such that numerous cottars built houses on the lotted cr[illegible]ts, and their stock-keeping on the common was tolerated because of the demand for fishing crews. About 1884, the system whereby each boat was tied to individual fish merchants, who advanced meal and provisions against the catch, was discontinued. When this system was replaced by the auctioning of catches, such was the privation in Lewis that the Royal Commission investigating the poverty of the population in 1888 found conditions almost as severe as those prevailing during the potato famine forty years earlier. It was during this period that the Park Deer Raid occurred: Park became a Deer Forest in 1883 at the end of the grazier's
[685] lease. In 1888, as a demonstration of their grievances, a large number of crofters from the Park townships went into the Deer Forest and killed about 200 deer, cooking the meat in the open for all to see. Some were arrested but after trial acquitted.[3] A few good fishing seasons remedied this unhappy situation and the population of the fishing townships rose to a peak in 1911.

Fig. 3. The Crofting Townships of Park

/facing p. 4/

While the Royal Commission of 1883-6 was investigating Crofting conditions in Scotland, the farm of Seaforthhead and Shieldernish was restored to six crofters. Six years later, the Royal Commission of Enquiry into the Highlands and Islands scheduled the following land as suitable for new crofting townships: Stiemreway, Eilean Calum Cille, Crobeg, and the islands of Orosaidh and Rossaidh, a total area of 153 acres arable and 3,502 acres grazing. A further 165 acres of arable and 40,135 acres of grazing in the Park Deer Forest were scheduled as land suitable for the extension of existing holdings. The Report of the Commission considered "that in the case of Lewis, it cannot be left out of view that the congestion is very great, and the demand by crofters for access to lands now scheduled is of a very urgent nature ..... The Deer Forest Commissioners do not believe that the lands now scheduled are suitable for new holdings: but were these lands occupied as common pasture by crofters, under a properly adjusted system of management, their occupation would be of much advantage to the occupants and more than outweigh the disadvantages."[4] As a result of this recommendation, the islands of Rossaidh, Orosaidh and Iubhairt, in all 90 of the 43,728 acres scheduled, were given to Marivig, Calbost, and Lemreway, respectively, as additions to the common pastures; the sheep farm comprising Crobeg, Oronsay and Stiemreway, and the Deer Forest were left undisturbed.

In 1924, after raiding, Oronsay was reconstituted as a crofting township, all but one of the new tenants coming from the overcrowded crofts of Lemreway. An unsuccessful attempt was made by squatters who had built houses at Stiemreway, to have their unofficial lots recognised, but some families remained there till 1945. In 1934, fifteen small lots were cut out of the Gravir common pasture to relieve pressure on the Gravir crofts: this Department of Agriculture scheme marked the end of a century of population redistribution.

Thus the full recommendations of the Deer Forest Commission have never been implemented, but one can only conclude, after a study of the crofting economy, that greater participation by the crofters in the Deer Forest grazing would bring increased viability to the crofting community.

The landscape of Park has thus experienced four formative periods. Of the prehistoric era and the early historical period, when the Norsemen held sway, a few archaeological sites and a large number of place-names remain. From 1660 until the early nineteenth century settlement was slowly established and spread over all the coastal fringe: this period saw the maximum areal distribution of the small tenantry. From 1828 to 1843, eviction stripped the entire area south of Gravir and west of Habost of population, and large scale sheep farming was extended at the expense of the small tenants. The fishing townships from Cromore to Gravir were greatly expanded at this time. From 1858-1924, three of the cleared townships were reconstituted: the population in the majority of the fishing townships continued to grow till 1911. Since 1924, fifteen new lots have been formed in Park but the population has progressively declined.

The absence of large scale resettlement since 1886 differentiates Park from most other crofting districts, but the exodus of population since 1918 and the existence of a population constantly struggling for viability in an area deficient in resources are features common to the entire crofting area.

4 Report of the Royal Commission Highlands and Islands, 1892, (often known as the "Deer Forest Commission").

e unit is worked by more than one person: such
he table.

o. 8-B/

231 Table III reveals that there are 177 agricultural units with a souming; ten units are crofts in Glengravir without a souming and the remainder of the 219 units have no grazing rights. From this Table, it is clear that full stocking and overstocking increase with the size of the croft: the units of ten acres and over, on the basis of stock carry, would appear to be the most intensively worked. In all, just over half of the units take up their full souming. Table IV gives an [463] analysis of employment ancillary to croft work for 141 of the 219 units and it would appear that [561] neither ancillary employment nor age is significantly related to the intensity of croft working. [887] Table V points to the fact that more full-time crofters are to be found on the larger units but that less than one in four of the younger and more active men are full-time crofters. Tables [511] III, IV and V underline the fact that the larger units are also the more successful and it is significant that the larger units are almost all on the better land in the agricultural townships. The average size of holding in the agricultural townships is nine acres, compared with less than eight acres in the fishing townships, where the land is much poorer and the cultivable area much more restricted.

175 The trends in agriculture are illustrated by Tables VI and VII. The Crofters' Commission made 178 a survey of the crofts through the medium of Estate Factors in 1883; from Table VI it is evident 241 that the number of cattle was much higher at that time and that the cattle-sheep ratio in the 231 selected townships was 1:3 as compared with 1:25 in 1958. Table VII gives agricultural statistics for the parish of Lochs as a whole; separate figures for Park are not available. Since 1913, radical changes in the crop and stock patterns have taken place; bere (Hordeum vulgare) has disappeared as a crop, and sown grass and permanent grass for hay have since 1947 become the leading crops. Horses have all but disappeared, and the cattle-sheep ratio has risen from less than 1:4 to 1:39 for the whole parish. Since 1938, cultivation in Lochs Parish has declined by 36 [511] per cent. Large areas of lazy-beds, no longer cultivated, are visible landscape signs of these [824] changes; seaweed, the sine quae non for lazybed cultivation, is no longer carried to the upper parts of the crofts. In fact, many of the crofts no longer use seaweed as a fertiliser.

233 From the foregoing account, it is clear that there are two major agricultural problems in Park, 241 the lack of sufficiently large crofts with good arable land and an insufficiency of common grazing; these deficiences bring in their train the problem of overstocking, and the existence of uneconomic holdings.

241 The more progressive crofters, significantly resident on the better crofts of the agricultural 242 townships, have shown how croft land can be improved by re-seeding and sowing down to grass, 176 practices which could be fruitfully extended throughout Park. In addition, several townships by co-operative effort, have resseded small areas of the commons grazings with splendid results.

241 However it is clear that it is not possible for 219 viable agricultural units to be maintained on the present crofting area. The optimum size of croft which could maintain a family is a moot point, for the location and situation of a croft and the quality of the land and common pasture would all have to be taken into account in making an assessment.

231 This problem was referred to a practical agriculturalist who was asked to state what size of 241 croft and number of stock would be required to provide an annual income of £300, excluding croft 242 benefit (milk, eggs and potatoes consumed on the croft) and any costing for labour. To fulfil these conditions, one of the fishing townships was carefully analysed, and the expert came to the following approximations, assuming that the rules of good husbandry were in force after the croft had been brought up to a good standard of cultivation and re-seeding had been carried out where possible on the outrun and Common Pasture, and provided there was no overstocking, and that present favourable subsidies and prices continue:-

[Seaforthhead] [Shieldernish] [Habost]

161 suppression of the original townships opposed to six today. As a result, many lazy-beds, now 162 given over to natural grass, are being gradually encroached on by heather and juncus. Out 241 of the present population of twenty-three, one is permanently away and two have migrated 178 since 1939. There is a more healthy population structure, with a large number of males between 15 and 44, due to a large family having returned home and six children, five of school age.

361 In Seaforthhead and Shieldernish all settlement is below the road and house-sites are on [349] slight elevations. At Seaforthhead is the reputed hunting lodge of the Seaforth's, 'Seaforth Castle' [505] now ruined, but still showing signs of abnormal size and arrangement. When first settled, [491] communication was by ferry (1820). Now a cart-track, deeply rutted, to Elsken Lodge gives [78] access to the Tarbert-Stornoway road two-and-a-half miles away.

SHIELDERNISH

131 Shieldernish, also consisting of three crofts, is better situated on the Park and South Lochs 361 road. The three houses are situated on a well-drained northerly slope, half-way between the 332 road and the shore, but the three crofts are on better land and greater accessibility has led to better management and new ideas.

241 Cultivation in isolated patches reaches up to nearly 100 feet and the lazy-beds have been put 511 together to permit ploughing by horse or tractor. One croft grows neither oats nor potatoes, [246] preferring to enclose two one-acre parks, re-seed them, cut the hay in June, and wean the [231] lambs on the aftermath. By next year, this crofter hopes to have enclosed and re-seeded a [244] further acre and will then use the three in rotation. The other two crofts grow both oats and potatoes and one is also sowing down. The crofts average fourteen acres in size but although gentle slopes are extensive, the major part of the crofts is in permanent pasture. The total [226] stocking of the Shieldernish crofts is below the souming. Fishing is now only for domestic use [288] though there is a small jetty on No. 1. Part-time weaving is performed on two of the six crofts.

The future pattern would appear to progress to more grazing and less cultivation. Two out of the six crofts - both at Seaforthhead - are worked from outside the township and this isolated township, being difficult of access and having little cultivable land, is better suited to grazing. Shieldernish appears more suitable for enclosing parks for fattening lambs, as soils are deeper and slopes gentler, making the use of a tractor feasible. More could be got out of the crofts especially with fertilising and re-seeding for hay and pasture and growing [185] fodder crops for wintering. It is hoped to fence the common securely, and then stock will be renewed - a great necessity. Daily communication with Stornoway also means that Shieldernish is better placed than Seaforthhead for a flourishing settlement. The crofts are certainly of a workable size - provided part-time work, such as weaving, is maintained, along with the grants from the Crofter's Commission.

HABOST

Rachel A Hirst

131 Habost is scattered around a small bay on the south shore of Loch Erisort. Settlement 133 stretches for over a mile encroaching on three small hills separated by wide, well-drained 241 valleys which soon rise to the dominating Craigeal (225 feet). Slopes are varied but tend to 361 flatten out at about 100 feet near the road and on this flat, most of the cultivation takes place. Nearer the shore, slopes are much steeper and on the hills there are bare rock faces and thin [34] soils.

[Habost]

134 Drift is found near the shore and laps round the three hills nearly up to the road, predominantly heavy clay with small boulders; this is replaced above the road by peaty loam on rock. At one time, here was grown on the heavy drift. There is peat accumulation on the flat land near the road to a depth of about six feet and there are one or two peat banks.
137 Vegetation is poor; there is no bracken or cover and within the crofts, moorland grasses and sedges predominate on rough land, though there are many lazy-beds sown down to clover and cocks foot. On the hills heather predominates.

195 Habost is the oldest township in Park. In 1843 Maclennan came from Shieldernish and
692 took what are now Nos. 9, 10, 11, 12 and 13 and Ailean Tailear came from Taransay, Harris,
to No. 7. By 1886 there were thirteen crofts; in 1907 four cottars were recorded, three being
621 there before 1886; in 1957, No. 11 which had been shared between two brothers since 1906, became legally 11A and 11B making fourteen crofts. There are also fourteen operative units although two are worked from Kershader, both as 'hay and grazing' units, and two are worked as one unit within the township, for there are three non-crofting units.

241 Only sixteen lazy-beds are dug by spade, the rest have been drained with stone drains and
407 ploughed by tractor owned by one crofter who loans it out to Habost and Kershader. There are three 'Croftmasters' (hand-tractors) in the township but these are only heavy enough for bringing in peats, hay and similar light work. The progressive Habost community has fenced
293 off part of the common grazing, to keep the weaned lambs off the croft from August till November and so save fodder for winter when the croft land is open to grazing.

[244] Oats and potatoes alternate in the rotation, with a little sown grass for hay, sown in enclosed
[246] parks of about one acre. The tendency now is to increase the number of parks, cut the hay in
231 June and build up the lambs on the new grass. Shell-sand is used to fertilise the parks but
[324] elsewhere artificials, such as superphosphates, 'potato manure', potash, nitro-chalk and lime are used in addition to dung and, near the shore, seaweed. Most of the hay is taken from old lazy-beds.

291 The land is heavily overstocked: the soum is equivalent to 79 cow units, and actual stock is
233 144, whilst the figures for sheep are 191 and 618 respectively, including the sheep stocked in
[432] Park Deer Forest by seven of the Habost tenants. Sales of cattle are held at Garyvard in November
[221] and May and sheep and lambs are sold in Sternoway. Lambing was poor in 1958, 50-75 per cent being general, but many breeding ewes and other sheep have died.

241 The only cultivation on the common land belongs to the unofficial holdings. Behind Craigeal, however, there are some old lazy-beds, a well and ruins of a hut, which has not been used since before 1852. There used to be shielings on the far side of the common on Beinn Bhuidhe and
[311] below Loch na Ciste but these have not been used since 1888. Habost is one of the agricultural
[226] townships and fishing is only for domestic use; looms are to be found on only four crofts and
[282] trade is slack. One crofter has a lorry for contracting, carrying peats, fertilisers and stock
[493] to market and two have butcher's rounds in Lochs. There are two small stores.

361 Settlement is scattered, always on elevated ground, and in many cases the new house has
[312] been built in close proximity to the old house site. All have piped water either from the well or
[654] from a rain tank, drinking water being carried in the latter case. Grants from the Crofting Commission are enabling new building and improvements to be carried out.

[Habost] [Kershader]

464 Of the 53 residents, 19 are over 65 and only 5 under 15 years, leaving a working popu
161 of 29: seven are in permanent employment elsewhere. The population has been steadily
162 declining since its peak of 121 in 1901.
166
167 Since 1946, the township has changed considerably. It has been completely fenced and
178 method of cultivation has changed from spade and horse-plough to tractor and cultivators.
241 further fence has been erected for a lamb park and much land has been re-seeded; an inc
281 area has been put down to hay. It would seem that fattening of stock for market is intend
[407] better attention is being paid to stock. Yet the population is ageing and there are few young
[162] to take the place of the older crofters; when working units become larger and stock decre
a figure nearer the real carrying capacity of the grazing, the croft could become a profit
concern: at the moment, the croft is only maintained through grants and ancillary earnin
Should that happen, however, there must be more re-seeding and an increase of cultivati
vide winter fodder.

KERSHADER

Philip W. Wheeler, M. A.

131 Kershader is a township of forty-three permanent residents on thirteen crofts, which
161 for a mile along the southern shore of Loch Erisort. The crofts extend up to one-third o
162 mile from the coast with a two-and-a-half mile deep hinterland of common grazing. The
133 elevation is 270 feet and the average from 125 feet to 175 feet, but the crofts, mostly arr
361 in rectangular strips at right angles to the coast, are lower (maximum 125 feet) and incl
241 three main zones (Fig. 8):
154
361

(a) From the low cliffs of the shore to the road, approximately, a zone mainly belo dissected by four rejuvenated valleys. The soils of the greater part of this zone distinctive profile and tend to be moderately heavy, wet, and unsuited to fertilis seaware. The smaller hillocks in this zone have thinner soils of the same sort, main hill (crofts 10/11) is an extension of zone (c).

(b) A zone between 50 feet and 75 feet with hills rising to over 100 feet. The lower have varied soils, easily fertilised, and intermediate in type between those of (a (b), with peaty-loam characteristics, overlying aquiferous gravels. The higher have thinner soils of the same kind with poor grassy pasture; in places there ar of former skinning.

(c) A zone of hollows with deep moss soils requiring intensive drainage and reactin to heavy fertilisation with seaware and intervening heights covered with blanket partly skinned, heather and grass. This zone passes into the common grazing.

Crofts 10, 11 and 12, irregular in disposition, have a steep coast line with gentler slope 50 feet; crofts 2 to 8, steep slopes in parts of zone (b), and crofts 1 and 9, again of irre shape, are intermediate (Fig. 5).

241 In Kershader, there are thirteen legal crofts and twelve operative units. The crofts
311 ween 4.4 and 18 acres, with a maximum of 3 acres reputed arable. In all, there are 23. reputed arable and 110.35 acres outrun. 24.5 acres are in fact under crop (oats 18.5, p 6.0), and 9.5 acres under sown grass; and of the remaining 99.8 acres, mainly natural

THE PATTERN OF CROFTING

427 Crofting, a distinctive system of land tenure, is confined to Argyllshire, Inverness-shire,
421 Ross and Cromarty, Sutherland, Caithness, Orkney and Shetland, the seven Crofting Counties of
178 Scotland. Small agricultural units sharing rights in common land, usually pasture but in some
423 districts arable land also, survive in 151 out of the 163 parishes, and these holdings form the
477 nearest equivalent to peasant communities in Britain, although only a small minority of crofters own their holdings, and the true subsistence element, implicit in any definition of peasantry, has all but disappeared.

195 Before 1886, the crofter was a tenant-at-will, with no security of tenure, and no right to
427 compensation for improvements. The Crofter's Act of 1886, defined a croft as an agricultural
341 holding in a parish where there existed, or had existed, rights of common grazing, and where the
423 annual rent paid was less than £30. Security of tenure, and compensation for improvements were the main provisions of the 1886 Act; the rent qualification was later raised to £50. In all, there are about 20,000 crofts in Scotland today[1] and Collier[2] estimated the crofting population at
[161] about 100,000. The number of crofts in Park is 215, with population of 908. Thus Park forms
[162] a 1 per cent sample of the crofts, and a 0.9 per cent sample of the estimated crofting population.

Crofting Organisation, Layout, and Settlement.

423 The characteristic settlement unit is the crofting township: Figure 3 illustrates the areal
427 distribution of the 12 townships in Park. Each township comprises two main elements, the
341 individually held croft land, and the common grazings. The number of crofts per township
311 ranges from 6 in Caversta to 43 in Gravir.

432 The individually held croft land (1,839 acres) is partly 'outrun' or permanent pasture and the
233 holdings are usually but not always consolidated - in Gravir (Fig. 4) and Cromore some of the crofts comprise as many as five non-adjacent pieces of land. Each croft is normally separated from neighbouring units by a drystone dyke or fence but in Park, such demarcation is the exception rather than the rule.

The croft land is separated from the common pasture by the township dyke, a stone or turf wal
The Park common pastures consist of 22,023 acres of moor grazing - generally very poor, ill-drained land with a large percentage of bare rock, areas of peat, and numerous lochs. In Park, only Oronsay common pasture is fenced, the limits of the remainder being faintly marked by crumbled turf dykes. Each croft has a defined right of grazing or 'soum' on the common pasture; the 'soum' is the number of beasts which may be pastured, a term comparable to the obsolescent 'gates' of northern England. In Gravir, the soum is 1 cow and follower or young beas up to 6 quarters old (i.e. 18 months), and 8 sheep, per £1 rent. There is also a system of stated equivalences (Gaelic 'coilpeachadh') in most townships whereby substitution of cattle for sheep and sheep for cattle is permissible: in Gravir, the exchange rate is one cow for five sheep. Soumings and equivalences vary throughout Park. In former times, when a subsistence economy prevailed, soumings were enforced but nowadays the majority of the crofters do not even know the souming of their croft.

1. A legal croft is any piece of land registered as a croft - a tenancy may consist of one or more crofts. There are 213 tenancies.

2. Cotters, fouars, squatters with stock.

3. An agricultural unit is defined as any unit, whether a legal croft or a number of legal crofts owned and/or sublet, or a cotter, fouar or squatter having stock. Agricultural units may include crofts in other townships worked from the home unit; the areas and sowings of such crofts are added to the township

from which they are separated and subtracted from the township in which they are situated.

4. See page 5 for definition.

5. Some tenants in the townships of Beaforthbeag and Ehisiderniah, Rahoon, Kerahader, Garyvard, rent grazing in Park Deer Forest and therefore this stock is not related only to their respective Common Pasture Dennings.

6. Arable and outrun are not statistically differentiated in the totals, the proportions of arable to outrun in the other townships have been used.

/facing p. 8/

[Devrit] [Lamrey]

The organ land in Gravir is a reflection in the number of its people of the economic situation in the whole island. Of the 1,000 people who could be the mainstay of employment in a mixed-crofting community there are only 300 left. Of these, more than half are over 60 years of age. The farmer is subject to the trade fluctuations in the mainland, he is a small farm-holder pinched since the introduction of the hurdling fencing, practised subsidy, although the raising of the initial capital for buying and equipping hoats is a formidable problem. It is clear that a division of the community into a crofting and non-crofting sector is essential if the present population level is to be maintained. The most serious aspect of the present trend is that the migrating section of the community is the younger and more enterprising section of the people. Unless holdings of economic size can be formed, and stable employment introduced, one can expect the younger men and women to remain in Gravir.

Until a major reorganisation of the crofts is carried out, a vigorous attempt to re-seed large areas of the common pasture and the three former arable commons, and the development of a crofting tourist industry, are interim possibilities. It is not unfortunate that the Gravir crofting districts that there is a demand from the city dweller for simple accommodation and good plain fare in a clean atmosphere, with the possibility of hill walking and fishing and good fresh and salt water. Yet, until the proposed water-scheme becomes a reality, tourism on a moderate scale can hardly be contemplated.

One can only conclude that until reorganisation takes place and transforms Gravir into a township of viable agricultural holdings, any stabilisation of the present trends is out of the question. A sudden decline in the number of holdings is inevitable in the long run but a pleasant reduction over a number of years would allow a more stable transition from the existing crofting system, which will need some such planning. Until this is achieved, the young men and women have little incentive to remain in Gravir.

LEMREWAY

Beth Bloomer, Brenda C. Turner
and John E. Wearmouth

Lemreway, the southernmost township of Park, comprises 250 acres arable and outrun divided into thirty-three crofts and 3,500 acres of outrun common pasture. The township is situated on the northeast side of Loch Shell round a bay in the shelter of Eilean Iorard.

The township consists of three distinct areas. A flat, poorly drained area at about 100 feet, part common pasture and part reclaimed as arable on the lower slopes of the hill, locally known as 'the Quoad', forms the first subdivision. The second area, further west, is at a hummocky nature. To the east, a steep slope rises to an altitude of 400 feet, (see Sheet 1) with a little crofting land on the lower slopes. The beaches are to be seen at about 100 feet on the steeper slopes and are clearly defined. The terraces appear at the same height on the north side of the loch, and Lemreway is thus left with a bed of a marine deep-sea lake, which has drained through this sector allowed the lake to drain southwards leaving a relatively deeply incised valley through which the present stream flows to the sea.

The soil is generally poorly drained and poor in lime and the better drained gravelly loam which is found in the east and along the main stream; the latter is particularly suitable for potato cultivation.

Except on rocky outcrops, the very steep slopes and the drained areas, blanket bog predominates: Sphagnum here is rarely dominant but where the land is half drained and half waterlogged Purple Moor grass (molinia caerulea) and cotton grass (Eriophorum vaginatum and Eriophorum angustifolium) are the dominants. On slightly drier land purple moor grass (Molinia caerulea) and moor grass (Nardus stricta) are dominant. Local dominants are bog asphodel (Narthecium ossifragum) and cross-leaved heather (Erica tetralix) with other common species such as bog myrtle (Myrica gale), tormentil and intermedia), butterwort (Pinguicula vulgaris), Sundew sp., Carex panicea and Carex pulicaris occurring sporadically. Where the peat has been cut or drained, 'heavy moor' usually develops and Calluna

[illegible] is dominant. Ling, which has interred considerable soil water, often occurs with Nardus, Molinia, Sitrpur caespitosus and Eriophorum. A few rowans, usually near the shore, and a few birches, usually with stone enclosures, are the only trees to be seen.

Of the thirty-three legal crofts in Lemreway, nine comprise less than five acres, while seventeen are between five and ten acres. Of the remainder, only two exceed fifteen acres and one of these is 30 acres. Six unoccupied crofts are worked by partners other than their tenants, so actually 26 and 250 divided between fifteen tenants but confused subdivision has resulted in four separate holdings directly occupying nine acres, and working another four acres. Thus the extend today must be regarded as the monopoly of four 'unofficial' holders.

Little more than a quarter of the croft land is cultivable and even less is actually cultivated because of the inadequate crofting year. The broken terrain and the steep nature of the soil has permitted the cultivation of tiny 'lazybeds' and the total cultivated area is now about 45 acres. Only a few strips of land on the gentler slopes, where the soil is deep, are cultivated. Barley is the only crop which stands a chance of ripening, more extensive, layout cultivation, often covering at least two acres. For example, one tenant, using the ridge and furrow system, has cultivated about 1500 feet.

Oats and potatoes, 29. 5 and 16 acres respectively occupy almost all of the cultivated ground. Most crofts grow about half an acre of potatoes and one acre of oats; both acreages have declined, the former with a declining population and the latter with a reduction in the number of cattle; hay has increased in importance. No turnips grown, though before 1930 it was preferred to neeps. Barley is grown on half of the croft, which caused to function at the beginning of the century, one still be seen. Only about 4 acres of natural grass are cut for hay but only four crofters had sown grass for hay in 1956. Some 4 acres of land are cut for green fodder for vegetable and other hen potatoes are grown, but only one or two crofters grow turnips. Turnips and cabbages were grown. The soil needs careful preparation to be productive and almost every crofter owns a plot of at least twenty five subsidies for ! and artificial fertilisers are used.

Stock tenure has declined recently but the township has 16 cows and 22 calves, 3 bulls, 1 stirk, 1 ewe, 1 ewe without cattle and 22 of the 33 working units have a cow and a calf. The township has an Ayrshire bull in lieu from the Department of Agriculture and Fisheries. The breed of the cattle, although the choice of the crofters, is difficult to find but it seems that at least three bosses could be used.

It is premature to speculate on the future of Lemreway, but it is clear that it is at the point of considerable enterprise is being shown. A Ferguson tractor, bought this year is now returning from winding, is an example. It is to be hired out and could be put to good use in the 1,500 acres of arable land. The attempt to improve the common pasture and the new extensions to nasty painted houses very and show initiative and enterprise. Lemreway is a township with a future if it can be being adapted to modern times and crofter-weaver, crofter-postman and crofter-bus driver are the contemporary successful combinations.

The soil is not enforced in Lemreway and it is remarkable that the total stock tallies almost exactly with the acreages. An examination of the sheep roum reveals that the stock of 917 (including lambs) could be fed on the arable land alone for 18. In fact, the sheep do not need to be housed at all, nothing only of some 17 acres that are overstocked; of twelve such units, eight keep more sheep than they are entitled to. Some of these crofts are grouped on the eastern side of the township where the crofts have a larger acreage.

This, while apparently not as severe as in many townships, it represents a potential threat, particularly if the common pasture is not improved. However, in 1958 ten acres of the common pasture have been reclaimed and reseeded and a further 20 acres have been reclaimed and sown, two acres with pelleted seed and two acres with pelleted and inoculated seed. The eleven crofters taking part in the scheme put on 100 tons of seed to help drain and aerate the peaty soil. (I tons of ground mineral phosphate and 2 tons of concentrated compound fertiliser, grades 1 and 2.- all of it by hand. The area was seen in May 1958. By the following August, there was a striking difference between it and the untreated pasture. Next Spring, eleven cows will be grazed on this area. With the success of this scheme, it is hoped that more of the crofters will co-operate in re-seeding further areas.

The West Highland Crofting Land Commission [illegible] predominantly a fishing community. Its fishing and curing station was established in 1882 and there were twenty twelve boats operating from Lemreway. A declining market, increasing cost of gear for obsolescent boats and the lack of a landing stage led to the decline of the industry in this township. Today there is one fishing boat which lands its catch in Harroway: working with modern equipment, drift and ring nets. It provides a regular income for a crew of six.

An examination of the population statistics proves interesting, especially when compared with that of Gravir. Lemreway's population increased by 20 per cent since 1931 and now 75 months ago 70 people, considering that there are six unoccupied crofts. Eleven of the crofts have more than one house and the outer population forms over a third of the total residents. More than two-thirds of the resident population is in the two important age groups - between 15 and 64. With over forty unoccupied crofts in the township, Lemreway provides a striking contrast to other crofting townships in Park.

Fourteen of these men are full-time croft workers, while nine others find work in ancillary occupations, mainly connected with the land. Four are employed in the local shop, one is a postman, one is a ferryman, one is a gentleman farmer, where the croft is cultivated by hired labour. A forty driver and several part time jobs. Four thirty people work away from the township, mainly in the Lowlands, and two of these have been married and have brought their wives to live in Lemreway. Only about 100 feet.

Emigration from the township has continued steadily with forty people leaving since 1939. Nevertheless, Lemreway has a larger proportionate resident population than most townships.

Only four thatched houses are occupied and housing conditions generally are good. Every house has electricity, the result of a community effort. Water is still a problem in the township. Water is to be piped to the croft land, which caused to function at the beginning of the century, one still be seen. Only about 4 acres of natural grass are cut for hay but only four crofters had sown grass for hay in 1956. Some 4 acres of land are cut for green fodder for vegetable and other hen potatoes are grown, but only one or two crofters grow turnips. Turnips and cabbages were grown. The soil needs careful preparation to be productive and almost every crofter owns a plot of at least twenty five subsidies for ! and artificial fertilisers are used.

By the following August, there was a striking difference between it and the untreated pasture. Next Spring, eleven cows will be grazed on this area. With the success of this scheme, it is hoped that more of the crofters will co-operate in re-seeding further areas.

[Devrit]

which rises steeply, reaching 270 feet in the west and 150 feet in the north and east. From the north-west and north-east two glacially deposited sand drains southwards, their lower ends being "diverted" by southward extensions of the land. [illegible]

Although peat covers most of the surface it is only in the hollows that it is significantly deep, for even on the gentler slopes the peat cover is frequently so thin as to expose a layer of morainic soil and stones lying many stones and boulders.

Two rowans and a dozen willows represent the only tree growth, but tree stumps frequently exposed in peat-cuttings suggest that woodland was formerly more extensive. Whether this former woodland disappeared as a result of human or climatic change is not particular to say, but it is certain that a century of overgrazing has left no woodland regeneration. Moorland grasses, sedges and a little poor heather characterise much of the vegetation, the latter being more especially on the moraines. Bracken has established itself in one limited area on a patch of neglected croft land.

Orinsay is unique in Park, for the present township is entirely a twentieth century development. In the early 19th century, Orinsay was part of the township of Ceilbeg. In 1841 the 21 residents were removed and the area enclosed and added to Crofeg sheep farm. In 1916, there was a proposal to establish thirteen crofts, but the applicants were requested to wait until after the war. At the end of the war the return of many young men with a desire to settle down led to serious overcrowding in Ceilbeg and the crofters were allotted the thirteen crofts in Orinsay. Some, however, have built their own houses, and in 1922 the Department of Agriculture intervened, recognising and forcing all fourteen legal crofts at the same time. Some crofters have gone and forgotten. Seeing the losses, their neighbours, four other Lemreway families, comprising 25 people, went to Blairmeavy, about a mile to the west of Orinsay. Once, however, the Department of Agriculture did not interfere and with the community remaining isolated, most of the settlers returned to Lemreway within three years, although one family remained and is still there.

Mention must be made of the possibilities of the tourist trade in Lemreway with the most attractive situation and reasonable road communication. Lemreway is within sight of the Britain Youth Hostels Association and while hostellers could not greatly increase the income of the residents, it would provide an interest in the area. Accommodation for a dozen visitors, after the children of the crofters, is difficult to find but it seems that at least three houses could be used.

Only small sums have been spent on the croft land, so it is clearly underutilised. The broken and rocky terrain combined with the poorly cultivated land has left the cultivation by spade and tiny lazy beds. The total cultivated area has increased from 1937, when it was 25 acres, although in the past it may have been nearer 40 acres.

Oats and potatoes are the staple crops, occupying 9 and 6½ acres respectively in 1958. Individual croft acreages of four acres and more are devoted to potatoes, the remainder being devoted to oats in case of potatoes, to domestic consumption. Nevertheless is produce even these meagre returns the soil requires careful preparation. A plentiful supply of seaweed is obtained from the shore and is the most frequently used fertiliser, while a little sulphate of ammonia is applied. Only two crofters use lime.

In the last two decades a number of changes in the amount of oats grown has accompanied a decrease in the numbers of cattle and an increasing use of hay for fodder. Nevertheless only about 12½ acres of hay altogether are cut, and only five of the crofters grow any green feed.

In August 1956, the township supported only 13 cows, 3 young beasts and 8 calves. Half of the crofters have one cow and a calf, and three have no cattle at all, and one even used condensed milk. A cow and a calf on the shore are cattle in the township, but a phenomenon so scarce uncommon in crofting areas.

[Orinsay]

Recent trends also point to a decline in the numbers of sheep, although more are kept now than ten years ago. From 1947 there were about 500 sheep, including 275 breeding ewes. Since then the stock has increased to 300 per cent. Peat-cutting is gradually destroying valuable grazing areas; in the last three years there has been some reclamation in Harris tweed. By 1955, when the subsidy was suspended, numbers had already begun to decline and have been less ever since. This year the township has only 374 breeding ewes while the rearing of only 236 lambs would suggest a further decrease in the future.

All the crofters keep some sheep although individual stocks vary from 15 to 150. For most of the year these sheep are grazed on the common pasture in the north-east, but in the eighteen days of the sheep dipping and shearing, the crofters are allowed to graze on the arable land. Dipping is carried out in the gates are opened and all the sheep allowed to graze on the common pasture. Shearing is carried out in June. If necessary they are brought back to the arable land. Sheep are not allowed to return to the moor, although the gates are not "locked" until May.

The cost of the sheep dipping is considerable, amounting to 1500 acres, but most of this consists of homework, the actual post mortem supplying only poor quality coarse grasses and sedges. Only 300 sheep now graze the hill, the remainder being confined to the arable land. The sheep are strictly domestically overstocked, the crofters which most inevitably harm the animals as well as the land.

No pigs or horses are to be found in the township and each crofter keeps very few hens, normally just sufficient to provide the family requirements. Occasionally a crofter keeps which is sold to a neighbour or to the Co-operative van, but prices are so low that the keeping of more than a dozen hens is far from profitable.

It can be appreciated that crofts of this size and quality can neither provide the crofter and his family with sufficient income, nor fully occupy the available labour force. As a result, people in the past have sought work in the Lowlands. Since 1939, however, the number of people leaving Orinsay has been reduced by the Forestry Commission and the Herring Industry. Today the herring fleet has disappeared entirely and only one crofter still does a little inshore fishing, mainly with a boat which belongs to Harroway.

There are 48 people resident in Orinsay but an examination of their ages reveals that less than half of them are between 15 and 64 years of age. Only 15 and 16 resident members of the township are spend at least part of their time working away from the township on the Kinlochleven estate.

As a crofter-weaver, a school, post office, shopman garage in Orinsay, there is no available occupation in the 'service trades'. Therefore, over half of the males between the ages of 15 and 64 are permanently away in the Lowlands. Of the remaining 15, only three are fully employed in Orinsay, while another third are seasonally away with the shallow. Similarly almost half of the females of similar age work in Lowlands, mainly in domestic service. Only a few are employed in Orinsay, the working age contingent being confined to the wives of the crofters.

The district of Park is one of the more isolated and difficult crofting environments. The ruggedness of the terrain, the high proportion of land of very low agricultural value and sheer isolation make the problems of rural depopulation and economic development in Park particularly difficult. Its isolation has ensured that it has established as a result of population pressure in more favourable areas of Lewis, and the original small settlements grew rapidly as a result of a change in land use which was a national trend - the conversion of poorer areas from subsistence farming to an extensive sheep-rearing economy. The impact of this change to sheep rearing in Park in the form of the eviction of a large body of small farmers in favour of an extension of the grazing area. Thus the present conditions are a legacy of the relatively recent past, and of legislation, particularly in the Crofters' Act of 1886, which recognised, and partly agreed to the maintenance of a larger population than the land could reasonably carry'. Two World Wars and changing economic factors have had repercussions in Park and resulted in a change in the pattern of social values, and depopulation has resulted; the 1951 population was 60 per cent of the 1911 total.

The Commissioners proposed that crofts should be enlarged to 4.5 and over should have security of tenure, with a view to the eventual disappearance of greatly uneconomic holdings; in the Act. all holdings were given security of tenure.

[Orinsay]

The future existence of the common pasture of Orinsay is a pre-requisite being seriously endangered by peat-cutting and reclamation. Only 300 sheep are now grazing the hill, the actual sheep stock exceeds the mean by 300 per cent. Peat-cutting is gradually destroying valuable grazing areas; in the last three years there has been some reclamation in Harris tweed. By 1955, when the subsidy was suspended, numbers had already begun to decline and have been less ever since. This year the township has only 374 breeding ewes while the rearing of only 236 lambs would suggest a further decrease in the future.

All the crofters keep some sheep although individual stocks vary from 15 to 150. hinterland with the outside world, Portree is a center for tourists during the summer. Due to the people's dependence on tourism and also the presence of newcomers, the villagers participate in a number of social activities which are not tolerated elsewhere on the island because of religious ascetic-ism.

Glendale and Kilmuir are crofting communities, each with a population of about 300. All, except the ministers and school teachers, are dependent on the breeding of cattle and sheep and the growing of a limited amount of grain, potatoes and hay for all or a large part of their livelihood. All are bilingual, speaking Gaelic and English. Neither community has a village nucleus, but both have an economic focus. Glendale has a cooperative farm, and Kilmuir has a drained loch which has been divided among the small farmers. The significant differences between them are three. The Glendale people are land owners. In this respect they are rather unique in the Highlands. The Kilmuir residents, like most Highlanders, rent their crofts. The second difference is religious. Glendale is religiously homogeneous while Kilmuir includes church-goers of three Presbyterian sects. Finally, no formal social activities other than an annual meeting of the share-holders in the farm is allowed in Glendale, but Kilmuir has a club organisation for the men who gather for lectures and discussions of economic problems.

133 South of the basalt plateau, the Cuillins and the Red
34 Hills have intruded into the lava. Although the Cuillins
dominate the landscape for many miles, they are absolutely
132 useless agriculturally. Indeed, a case might be made for the
derivation of the name Cuillin from the Welsh coolin (worth-
less).[3] The worthlessness of the mountains in the local
economy is attested by the fact that they are the only mountains
in Scotland with peaks named after men, all of them mountain
132 climbers of the last century.[4] At the same time, however,
34 they have become a valuable asset in the tourist trade.[5] The
Red Hills rise to 2,537 feet. They are mostly covered with
scree and skeletal soils, but they have some pastoral value.
All have traditional Gaelic names.

Below the mountainous region a broad limestone valley
133 extends across the island from Broadford Bay to Loche Eishort
and Slapin. Like northern Skye, it is a gently rolling region
28 with few rises which exceed 500 feet in elevation. The po-
tentially good soil is frequently masked by a heavy overlie of
peat.

Sleat, the southernmost peninsula, reveals a compli-
133 cated structure, a complex of ancient rocks and moraine.[6]

[6] Darling, op. cit., pp. 28-29.

133 The northeastern end of the peninsula is covered by glaciated,
34 rounded hills rising to 2,396 feet. The remainder is a low-
lying area of soft rises and deep glens. The soil cover is
largely no more than a physical zedium. Were it not for stoney
but light, well drained soils on several raised beaches and
morainic soils derived from the mainland, large parts of
Sleat would have no cover other than ice scoured rock. Peat
covers many of the flatter facets.

Despite the multiformity of the physical appearance
133 of certain areas, cannot help forming the impression of a
34 certain sameness. Except where bare rock stands out in stark
relief or where man has laboriously turned the soil to agri-
cultural use, the flora of Skye is primarily grass only
occasionally interspersed with a few trees. In the glens
and on the lower slopes of the hills rescue and bent grasses
34 are found wherever the natural drainage is good. Both are
tender and excellent for pasture. Poorly drained land supports
coarse sedges and rushes. Above 300 feet moorgrass is found
on dry facets and rushes and mosses on soggy ground. The high
hills, such as the ridge of Trotternish, maintain a sub-alpine
pasture of small flowers, mosses, and sparse grass. Obviously,
the main factors governing the natural flora are drainage and
133 altitude. Man and his stock have also influenced the vegetation.
34 Selective grazing by sheep has allowed the spread of a large,
tough fern, called bracken, which has markedly reduced the
133 pastoral value of extensive tracts of the best land. Another
common plant is heather. True heather moors, however, are

133 exceptional. The largest is found in the glen between Portree
34 and Loch Sligichan. Of the total area of Skye, approximately
447,000 acres, over 400,000 acres are rough grazing, incapable
of being tilled.

The scarcity of trees is an environmental feature
worthy of special consideration. More than the mere aesthetic
appreciation of the traveler is involved. The lack of shelter
is a crucial factor in limiting the variety of crops which
can be grown. There are three "forests," but they are deer
34 forests without trees and with very few deer. Wooded areas
exist only where landlords or, more recently, the forestry
commission have planted for amenity, shelter, and anticipated
lumbering operation. Pollen analysis, from an archaeological
find,[7] and stumps, discovered in peat bogs, suggest a once
widespread natural forest of birch, hazel, elder, oak, and
pine. All that remains are a few small areas of birch and
hazel on peat-free slopes and on sheltered escarpments beyond
the reach of the cattle and sheep, and some residual oak woods
in Sleat. So sharp is the contrast of Sleat with the rest
of Skye in so far as vegetation is concerned that this
28 peninsula has come to be known as "The Garden of Skye." The
proprietor has played his part in the creation of this impression by

137 planting birch, hazel, oak, juniper, larch, spruce, and short
28 pine. These are the usual trees found on the plantations.
Typically, the Sgriathanach prefers an unobstructed view to
trees. He may tolerate a mountain ash or elder near his house,
but he has little desire to be surrounded by woods.

The Climate of Skye

132 Lying in the temperate marine climatic zone and in-
fluenced by the Gulf Stream, Skye is noted for its mild
winters and cool summers. The annual mean temperature range
is between 14 and 16 degrees. Temperatures above 70°F. and
below 40°F. are exceptional. Although frosts may be expected
from October into May, severe frosts are uncommon. In recent
years there have been two, one in 1954 and one in 1947. The
climate is not, however, to be considered moderate. The
spring is not appreciably warmer than the winter. With a
maximum noon temperature of 68°F. for August of 1953 (Struan),
it is hard to believe that summer exists as a season.
34 Economically, these climatic features mean that the planting
and growing season is late and pasture growth is slow.

The outstanding characteristic of the climate is the
amount of rain. Rainfall varies from considerable to excessive,
depending on the locality and the year. The rainbearing winds
blow in from the south and southwest. Thus, in the lee of
the Cuillins, Red Hills and the ridge of Trotternish, the
annual rainfall approaches 80 inches. The driest area of Skye,
northwestern Trotternish, has an average annual rainfall of

132 summer, despite the long duration of daylight, the average daily
hours of sunshine are six. In winter, the daily hours of sun-
shine are reduced to less than one. In 1953, an average year in
respect to sunlight, the total hours of sun were 1142. Over
132 200 hours were recorded in June but less than 20 in December. It
103 may be that the philologists are right in insisting that Eilean
Sgriathanach is derived from the Norse ski (cloud). Certainly the
poetic name for Skye, Eilean a Cheò, the Isle of Mist, is in
keeping with the atmosphere.

The prevailing rain and cloudiness are serious handicaps
to agriculture, but they are not the only inhibitive forces.
The wind is another very important factor. Gales are common.
They restrict the number and variety of crops which can be
grown, hinder tree growth, and often make the use of the sea
impossible.

The System of Land Use

34 The Sgriathanach, the Skyeman, is a small farmer who
combines pastoralism with a limited amount of agriculture.
In view of the severe environmental limitations on crop pro-
duction and the markedly disproportionate ratio of arable land
to natural grass land, this ecological adaptation of the culture
172 is by no means surprising. Nor is the fact that this adap-
34 tation has persisted since the first known appearance of man
a startling revelation. This was four thousand years ago when
the culture history of Skye began with the advent of the
34 Neolithic. This persistence is simply an expression of the

34 well recognized relation of culture and environment.[9]

The economic foundation for the present day culture is
34 commonly referred to as "the crofting system," a system of
133 hereditary tenure of individually held small patches of culti-
vated land combined with communal use of grazing land. On
his small plot, typically under five and seldom over ten acres,
the crofter grows a little oats and hay for his stock, a few
potatoes for his family and dairy cattle, and, in some cases,
28 a few garden vegetables. Anyone who is acquainted with the
Irish small farmer will recognize the underlying similarity of
the two systems.[10] The communal element in the crofting system
on Skye, however, is a distinguishing feature. In addition to
his croft, the individual has a common, concurrent right to
a share in an extensive area of grazing land. Here he keeps a
couple of cows and a score or two of sheep. After the harvest,
the stock are frequently brought down from the hill and allowed
to indiscriminately graze the arable land of the crofters who
share the communal lands. Thus, the efficient economic unit
is not the croft, the few acres of arable land, but rather a
"township," a collection of crofts and the common grazing lands.
The system differs from the runrig system which prevailed two
centuries ago only by the holding of permanent, compact blocks
rather than dispersed and shifting strips of arable land. It
is a unique survival in Europe.

[9] See, for example, Kroeber, Cultural and Natural Areas of Native North America, p. 5.

34 one or more country stores, a few workshops, and a post of
42 Kilmuir will serve as an example of these larger settlemen
34 Along the shore of Loch Snizort, on the peninsula o
42 Trotternish, there is a broad, fertile plain. Including o
34 Loch Chaluim Chille, there are approximately ten square mi
34 of good land. Although the soil is not cultivated as inte
ly as in the days when Kilmuir was "the granary of Skye,"
this is regarded as the best agricultural region on the is
42 In all there are 122 crofts, held by 105 crofters, in 9 to
ships. There are also two small farms. The population is
slightly over 300.

34 The crofters' cottages are loosely strung around the
42 old loch and across the plain in an irregular "V" shaped
pattern (Figure 3). Basically the pattern resembles the
French line village, but there are several features reminiscent of the British open country neighborhood. Most of
34 the cottages, it would seem, were originally built on the
42 landward fringe of the plain and along the shore of a small
bay, known as Camus Mor, without any regard for road access
178 In recent years, increasing dependence on motor transport
has led to demands for roads. Now almost all the crofters,
except those in Borreiseatalg, have a paved road running
by their door. About a third of the houses are on the oun
road which encircles the peninsula and links Kilmuir with
the outside world via Portree.

In the center of Kilmuir, in the township of Balgown,
34 are two spireless churches, a church hall, a two room sch

(TEXT CONTINUED ON PAGE 46)

[Kershader]

(b) From New Year to mid-April most sheep are kept on the common grazing. Practices, however, are irregular; some flocks are usually hand fed, others only rarely. In the form case they heft near the upper limit of their home croft and remain fairly close at hand. Most crofters hand-feed their lambs, probably housing them at night, allowing them hay in the morning and turning them on to the common grazing in the evening. All this naturally depends on weather conditions.

(c) From mid-April to May, lambing takes place on home parks.

Most crofters let their ewes-with-lamb out at one date.

(d) At the end of June, gimmers and wedders are clipped.

(e) In mid-July the ewes are clipped.

(f) The lambs are weaned in the first and second weeks of August.

(g) The dipping takes place in October and the rams are brought on the crofts.

There is no general sale time, sheep being sold or slaughtered at all seasons. There is no club stock, but all but one of the Kershader crofters, along with crofters from neighbouring townships, take full advantage of the arrangement, first established in 1941, to graze sheep at 2/- per sheep and 1/- per lamb in Park Deer Forest. Hence irregularities of rhythm are introduced or exaggerated.

Sheep are not particularly profitable: in general, wedder fleeces give 3½ to 4 lb, ewe fleeces about 3 lb, and the wool is sold to the Stornoway mills and to the Wool Marketing Board. Average sheep carcase weight is reckoned to be 41 lb. and the price rarely rises above £3 and almost never above £4. Braxy and fluke are kept under by medicaments but remain potential dangers; 'Black leg' is still a serious problem. Many sheep are drowned in the bogs in Spring and late snows (1955, 1958) are disastrous for lambing.

Under-employment is a serious problem in Kershader. There are nine males classified as full-time crofters, but probably only four of these (two on one croft) are in fact in this category, and of the total of thirty males with their homes in Kershader, only fifteen of the insurable population are permanently resident. There are twenty-eight females with their homes in this township, but on only six crofts do any of twenty permanently resident females help with croft work. Local ancillary employment consists of weaving, fishing (for domestic consumption only) and work on the roads. Boats, one with outboard motor, are owned by three crofts. The only resident professional worker is a nurse. Ancillary employment must be, and is, sought away from the township. As a result, of the 73 persons recorded as having migrated since 1939 or as being resident, periodically away and permanently away in 1958, 19 have left the area for good, 4 are permanently away, 8 periodically away, and only 43 are resident. Only one person has entered the township since 1939. The age structure of the population, too, is far from the optimum. The school in Kershader, which had 20 pupils in 1873, reached a peak of 110 in 1907 and declined to 28 pupils in 1953, now has but 17, although it serves Caversta, Garyvard, Kershader and Habost. Maximum population was attained in 1881, but the total remained fairly constant till 1911, after which decline was marked. Since 1950 this decline has markedly increased.

It will thus be seen that the most serious problem facing Kershader is that of stabilizing the population and giving it a stronger economic basis. Apart from the potential development of tourism, fishing, weaving and other home industries, the only possible occupation is in agriculture with perhaps a little forestry. Forestry, though important as shelter provision, cannot be a practical proposition in large blocks or on a large scale, as it would dislocate the

[Kershader]

ith heather and peat on the higher areas, hay is taken off 19.25 acres. Four acres, mainly for otatoes, are worked by spade but most of the cultivation is by tractor hired from Balallan or, 1958, from Habost. Lazybeds are common and in some cases are carefully renewed, but e present tendency, reaching its extreme in a field of about two acres on one croft, is towards e formation of larger, ploughable fields for ease of tractor operation. Most cultivation is in ones (a) and (b), with little development of (c) at present. The only crops are oats and potatoes, ith some garden plots of cabbages, turnips and carrots. The potato main crop is generally err's Pink (Golden Wonder on one croft), with a couple of rows of Skerry Blue or Edzell Blue r earlies. There is no memory of Black Oats (Avena strigosa), and bere (Hordeum vulgare) as certainly not been grown since 1930, and probably not since 1909. The oats are grown xclusively for winter feed and are hand-threshed with stock and comb as the need arises; the st water mill in the locality went out of use after 1914, the last handmill in 1916; no grain as been sent to Stornoway since about 1930. Rotations are extremely irregular: some lazy-eds are still cultivated with alternate crops of oats and potatoes and have heavy seaware and anure fertilization, but most other arable areas have some sort of oats, potatoes, oats, sown rass sequence. Fertilisers used are seaware and manure (ten crofts), manure (eleven crofts), sh and (one croft), lime (ten crofts) and artificials - 'Potato manure' and sulphate of ammonia - eight crofts. Artificial fertilisers and much of the seed are obtained through the Crofters' gency.

The only two horses ever owned by this township were kept on croft 11 from 1936 to 1953. The ough was first introduced in 1936. When a tractor from Balallan became available for hiring 1953, the horses were disposed of. The present soums are by cow, young beast and sheep r croft in proportion to rents and range from 3 cows, 3 young beasts, 69 sheep down to 1 cow, young beast and 23 sheep. Eight crofts exceed their entitlement but no croft hasless than half the uming and the deficiency is mainly in cattle, especially young beasts. On the other hand, no perative unit is entirely without cattle as manure is extremely important. Cattle are kept for mestic milk supply, and calves, having qualified for subsidy, are normally sold at 6 to 8 months. acres of the common grazing were re-seeded in 1957 and the following rhythm for milk cows developing:-

(a) As soon as the weather allows in May, the cows are put out in the park for about three weeks.

(b) Next, about 6 weeks are spent on the common grazing between the ring fence and the new outer fence erected in 1957.

(c) Back to the re-seeded park for about five weeks.

(d) Return to the crofts for the winter, being let out either to the park or to the common grazings whenever the weather is suitable.

he young beasts spend much of their time on the outer common grazings. As most of the crofts, ginning with one in 1938 and ending in sequence with 10, 11 and 12 probably in 1959, are fenced, e old arrangements for township commoning from 15th October to 10th May are now obsolescent. nother park was also fenced for general purposes and for weaning in 1957. Prices for calves d cattle are very low and this discourages cattle breeding; on the other hand, lack of winter ep enforces an occasional sale.

The rhythm of sheep husbandry is largely independent of that of cattle:-

(a) By 20th November all sheep, except possibly the lambs, are cleared from the crofts for the tupping of breeding ewes thereon till 31st December. Every crofter now keeps his own ram, exchanging it or buying another at least once in five years.

[Garyvard] [Caversta]

At the moment Garyvard appears to be a go-ahead village, carrying out communal schemes which will benefit the township as a whole. However, the age structure of the population is abnorma since 60 per cent of the population is over 45 years. The future in Garyvard offers young people hard work, little money and no entertainment, making the attractions of the cities and industries of the mainland quite irresistible. Unless some industry can be started the future bodes ill for the area, since most crofters are of the opinion that a weekly wage packet would more than compensate the loss of their independence. Perhaps it is symptomatic of the age of National Assistance and subsidies that man cares more for momentary rewards and the luxuries of life. This is well understood by parents who encourage their children to leave the islands to seek employment either in Britain or within the Commonwealth. The Lewisman is no sentimentalist clinging to dying traditi and a way of life. His present desires have been re-cast as a result of his increasing contact with the world beyond the Hebrides and he is prepared to abandon his home where it defeats his aims and purpose. Unless prosperity can be brought in by way of industry, tourism or increased croft efficiency, possibly through co-operation in working and marketing, it is possible that we are witnessing the end of a community.

CAVERSTA

Helen Mackenzie

Caversta lies along a southern inlet of Loch Erisort, five miles from the Minch and is partially sheltered from east winds by the Cromore peninsula and Eilean Chaluim Chille.

The physical nature of the terrain is irregular, rising steeply from the water's edge to a level of approximately 225 feet. To the west and to the east, the land slopes to the river estuary and it is here that the settlement occurs. Particularly in the north-west, two marked breaks in slope are visible at 75 feet and 100 feet above the loch, which is here bordered by a 25 foot rock face. The resulting platforms are separated by faces of bare rock. The valley of the Caversta River is a noteworthy feature. Below a small loch, the river follows an irregular course though a wide and shallow moraine-strewn depression and a quarter-of-a-mile from its estuary, has cut through some low hills rising about 30 feet above the depression. At this point, its course becomes steeper as it passes through a small gorge, which is probably an overflow channel.

Trees are non-existent and the natural vegetation consists of Sphagnum on the peat bogs in the hollows and grasses and sedges on the gentler slopes. The steeper, less waterlogged slopes, often broken by rocky bluffs, have heather cover; bracken growth is kept in check by heavy grazing. Forty-six acres of land have been reclaimed by clearing heather and removing peat to form the crofts, but the soil, which varies in depth from a few inches to a few feet, is very acid.

The six legal crofts vary in acreage from 4.75 to 8.5 acres and a squatter has 5.5 acres of enclosed land. The township is in two parts: Torista, with the two smallest crofts, lies at the eastern extremity, while the other five holdings, also bounded by a dyke, border Tob Caversta, an inlet of Loch Erisort. The crofts, which run from the shore to the township dyke, were set prior to 1861; originally the township formed part of Crobeg Farm. The legal units are, in fact, operativ units except that one of the Torista crofts, now unoccupied, is used for wintering lambs by the absentee's brother, a resident of Caversta.

There are no occupied black houses remaining in either Torista or Caversta, as during the past fifty years new dwellings have been erected in dressed stone or corrugated iron, usually with roofs of asbestos slate, tarred felt, or corrugated iron. Several old thatched houses are now used as barns and byres.

[Caversta] [Cromore]

161 The 1914-18 war had a marked effect on the Caversta population - 16 out of 54 (29 per cent) left after
162 1911 and no re-population took place. Since 1939, seven people have migrated to Stornoway or the
166 mainland, (16 per cent of the total 1939 population), and six of these were from Torista (i.e. 50
167 per cent of the 1939 Torista population); only one family now remains there. The demographic
position is becoming more acute for there are no young married couples and no youngsters growing
[166] up. The girls have left to marry and most of the men have sought temporary or permanent employment elsewhere, for with better communications, education and the radio, the pull to the towns has become stronger. There are now only two people in the township who could be described as full-time crofters, earning no supplementary income by weaving tweed on commission from the Stronoway mills.

241 Caversta is not one of the most progressive of the South Lochs townships. Although the crofts
283 are fenced, the common pasture is not visibly delimited from either the Cromore or Garyvard
632 pastures. At present, the grazing is fully stocked according to the soum, but the committee has not as yet initiated any re-seeding schemes. As the pasture is not of the best quality, some newly sown grass would benefit every crofter. Lack of manpower may in part account for this deficiency but even a small acreage of re-seeding would be a great asset.

000 The future position of the township is rather doubtful: it is not the best type of land for mechanisation and is badly served by communications. The future of Torista appears to be probably one of abandonment, unless it is more easily linked with Cromore. The possibility of a good road being built here is remote, as there is only one family to serve. The main part of Caversta is also open to question. Amalgamation of the crofts would not necessarily make more efficient units for the present units are not used to their full extent. Amalgamation with Garyvard might benefit the township a great deal, as the Caversta population is rather small to flourish in isolation. The future of Garyvard, Kershader and Habost is one of hope, but unless some change takes place soon, it is not difficult to see Caversta, and Torista, following the same course as Calbost and in thirty to forty years being little more than grazing land.

CROMORE

G. Mary Swindell, B.A., and Dennis F. Fancett, B.A.

131 Cromore is situated on a peninsula between Loch Erisort and Loch Cromore. Approaching it
361 from the access road, Cromore has the appearance of a nucleated settlement, but in fact each house is situated on the owner's croft. The crofts are so arranged that each has a portion of land on the more level surface of drift deposits; houses 1 to 20 stand at the junction of the drift and the
134 Lewisian gneiss. Soils are poor and thin, and there are numerous outcrops of barren rock amongst
137 the arable land. The natural vegetation is heather moorland with extensive patches of rushes and cotton grass, the pattern of most of the 'outrun' around Cromore.

241 The township comprises twenty-seven crofts and there are twenty-seven working units; two
632 crofts are subdivided while another four form double crofts. In addition there are five cottars and the Schoolhouse feu. Outside the township dyke there are two feus and four squatters. The croft layout differs from most other townships as each croft is in four non-adjacent pieces, one piece around the house, another above Creag Cromore and two pieces on another area of enclosed land on the common. Two crofts on the eastern side of Loch Cromore, have most of their arable land around the croft-house while three crofts have only one share in the other area of enclosed land.

241 Until this decade all the land around the houses, and much of that above Creag Cromore, was
311 regularly cultivated. Some of the lazy-beds on the higher land are being cut for hay this year but cultivation is limited to the land around the croft houses and is completely unmechanised. The only
[244] crops at present are oats and potatoes and these are usually grown in rotation. The crofters sowed
[246]

[Cromore]

The crofters sowed
241 clover with their oats in 1957; the quality of most of the natural grass could be improved considera
311 by extending this practice. Several of the crofters have taken advantage of the facilities for obtaini
[248] lime and fertilisers, but seaweed and byre manure are widely used. Only seven crofts have
[249] vegetable plots this year but that of No. 23, (partially enclosed by a dry-stone wall) has produced
[324] crops of lettuce, cabbage, turnips and carrots.

221 The souming for Cromore is one cow, one heifer and eight sheep per £1 rental, but is not
231 enforced. The crofters keep the stock which they can manage to maintain throught the winter and no one appeared to be dissatisfied with this arrangement. In fact the souming is exceeded by only
233 seven crofters and the total stock for the township is only 75 per cent of the soum. Lambing takes
[236] place in April and May and often a high proportion of ewes and lambs is lost. The sheep are clipped in July and each crofter usually clips his own sheep. He either sells the fleece or has it spun in Stornoway before weaving it himself. The lambs are taken from the ewes during the second week of August and then dipped; November is the tupping period and almost every crofter had his own ram. Most crofts have a cow and a calf and the crofters like the calves to be born in March so that they are six months old in October for the Garyvard sales. The cows are served by an Aberdeen-Angus bull from Crobeg Farm. The township gates are opened in October and the cattle remain within the bounds until May. An interesting regulation enforced by the Grazings Committee is that each family can have only one dog, and that it cannot be taken on to the Common grazing without special permission, or on fank days.

178 Shielings, situated on the common grazing between Calbost and Cromore, were used until
233 the 1890's. Active land use has gradually declined; in the 1920's, much of the outrun was under
311 cultivation and from an an air photograph, it is evident that hay was being taken on the strips above Cromore in 1946. The present trend is a continuing decrease in the amount of arable land bu
[292] this year ten crofters formed a group to enclose and improve a ten-acre plot on the common grazin
[345] it is unfortunate that all crofters are not willing to take part. Peats are now being cut near the road between Caversta and Gravir, about three miles south-south-east of Cromore and one mile north of Gravir.

17 Cromore was once a prosperous fishing village but now it has no fishing boats. Two Cromore
229 fishermen work on other boats (one from Marivig and one from Stornoway) and there are a few men who would welcome the opportunity to start fishing again. There seem little prospect of this,
[506] however. The landing-stage, completed in 1957, is regarded by many as a 'white elephant' and, in fact, at low tide it is useless. So much for the hopes that it might have been used by cargo vessels bringing goods to Park.

288 In Cromore there are fourteen looms for the weaving of Harris Tweed. Tweeds are obtained by
[433] road from two mills in Stornoway and one in Airidhvruach. At present the average production is only one tweed per loom per week but the weavers could quite easily double their production. Durin
[436] the past two years this industry has been comparatively prosperous. Knitting is a winter pastime but only for pleasure, although one household possesses a knitting machine.

162 In common with the rest of Park, Cromore has a high proportion of old people. Many from the
166 middle age groups have sought employment on the mainland, and the teenagers, many of whom have been at school in Stornoway, seek jobs there or on the mainland, returning for holidays and assistin
167 with the croft work. Some younger folk are resident to care of aged parents.
364

491 Cromore is only eight miles by sea from Stornoway yet all communications with the town are by
[490] road - a distance of thirty-two miles. There is a daily bus service and the sub-postmaster has a v
[493] which is occasionally hired. Some people recalled that the only route to Stornoway was once by boat to Crossbost and thence by bus. One resident owns a lorry and this is used for most of the haulage in Cromore, particularly for bringing home peats during the summer. As a result of recen
366 additions to the roads, only three crofts remain inaccessible to vehicular traffic. There are no shops in Cromore but grocery vans call on Monday, Tuesday, Wednesday, Thursday and Saturday;

[Marivig] [Calbost]

000 In conclusion, it may be said that the problem of Marivig's future, and that of other crofting townships, is not only one of adverse aspect, soil and weather conditions, and of distance from markets, but a problem of the population finding a stable and viable level where agricultural units are large enough to encourage the active and enterprising section of the population to remain, and a problem of finding capital to equip a modern fishing fleet.

CALBOST

Anne Cooper

131 Calbost is situated five miles to the north-east of Gravir on the Minch coast of Park. It occupies
133 a basin-like hollow in the centre of which is Loch Dubh, and is open to the sea on the east. The
361 croft houses are scattered over a shelf 50 feet above sea-level round the sides of the hollow and along the valleys which enter the township to the north and south-west.

134 The cultivable soil, a mixture of peat and well-drained gravelly drift, is on the higher ground,
137 although here the rock outcrops in many places. On land formerly cultivated, bracken is spreading rapidly and now covers a large proportion of the surface, although twenty to thirty years ago it was unknown. Heather dominates the common pasture and rushes are widespread in the low-lying central area. There are a few willows and rowans round the old buildings, probably planted as wind-breaks.

195 Calbost was originally a single farm but the township was formed about 1820. The pattern of
241 the crofts differs from the usual shore-to-dyke alignment, as six crofts were allotted extra land
311 in the valley which enters from the north, when a part of the common grazing was brought within
361 the township dyke. There are now fourteen crofts of which four are worked by resident crofters
[189] and two by squatters. The remainder are used only for hay and grazing and are sub-let to crofters in Calbost and other townships.

241 Cultivation is entirely by spade and of the 2.6 acres now in cultivation, potatoes account for
[240] 2.37 acres. The small acreage of oats reflects the greatly reduced cattle stock of only two cows and
[246] two calves. Approximately twelve acres of hay are cut as winter feed for the 225 sheep which graze in the township.

311 The lazy-beds in natural hay and the outrun are being rapidly encroached on by bracken. The prevalence of bracken, and the amount of work needed to clear it, is likely to deter any attempt at renewed cultivation.

178 Calbost was originally a fishing township in spite of its harbour being so exposed: boats have to
228 be taken up on the shore instead of being moored in the bay. The decline of the fishing industry whic
504 has prevailed in Lewis has contributed towards the almost complete desertion of Calbost, leaving
434 only a few boats now used only for leisure purposes. Croft income is supplemented by only two of
565 the men in the township, one a weaver and the other in the Merchant Navy. Although there are a few productive gardens, no attempt is made to market any produce.

293 The township dyke is very close to the settlement and in the past shielings were not so widely use
361 in Calbost as elsewhere. The cattle were instead brought near to the dyke for milking and allowed
417 to graze on the common unattended. There are ruins of shielings to be found on the hills around Calbost but a more interesting feature is the second dyke; enclosures were made adjoining the main dyke and in the late summer the cattle were brought to fresh pasture within these dykes before the opening of the township gates. Following the opening of the gates the stock are free to wander
[178] over all crofts but there seems today to be a move towards the complete enclosure of the crofts.

[Gr-vir] [Glengr-vir]

241 beds are now covered by sphagnum moss and heather. Other lazy-beds are permanently in natural
[197] hay; only thirty per cent of the land classified as 'old arable' is now in oats and potatoes. If natural hay is added, one hundred and thirteen acres of crops are taken from an area greater than the so-called old arable; this suggests that the cultivated area was pushed beyond the limits of the old arable (ninety acres) after 1850-52. As in all the fishing townships the area of sown grass is infinitesimal for only four of the fifty-eight operative units actually sow grass. The wintering capacity of the crofts could be greatly increased by the general adoption of the practice of under-sowing.

241 There are forty-three legal crofts in Gravir but nine are sub-let, in every case to relatives.
423 All the crofts are taken up and there is evident pressure of population on the land. In addition to the crofts, there are a further ten cottars, and squatters and feuars, besides the fifteen legal Glengravir crofts (ten operative units) which have no share in the Gravir common. The common
[332] has been encroached on by several feus for Gravir is the functional centre of Park: the Free
[346] Church of Scotland and Manse, the doctor, one of the two district nurses and two of the missionaries
[159] (assistant ministers) are all located in Gravir.
[193]

Gravir and Glengravir thus have fifty-eight legal crofts and fifty-six operative units. Less than
233 half of the crofts with grazing rights are fully stocked and one quarter have under fifty per cent of
311 the soum, including five without any stock. The common pasture of 2,652 acres is in general of poor grazing quality, dominated by the less nutritive species of grass and poorly drained. In 1957, a ten acre plot was fenced and re-seeded: only twelve of the operative units participated in this reclamation work, and the ages of the participants ranged between 27 and 58 years; this is significant as aged tenants are unable to carry out such work. This scheme could be extended annually; if potential improvements to the crofts are limited, pasture amelioration is virtually
[435] without limits. Re-seeding on a large scale would enable better stock to be kept rather than greater numbers; at present the sheep stock is over two hundred per cent of the sheep soum, and a ewe and lamb sell for as little as £2 10s to £3 10s, an indication of the consequences of over-stocking. The cattle stock is below the souming and this paucity of cattle is one of the notable changes in the agriculture since the 1930's for at that time as many as six cattle were kept on the larger crofts. The total stock kept in Gravir and Glengravir exceeds the souming by thirty-five per cent.

231 The great majority of the crofts can certainly not be considered economic units. Judging from
241 the souming of one cow and follower and eight sheep per pound sterling of rent in a township where
434 only seven crofts pay more than £2 rent, they were never intended to be self-supporting agricultural units. The produce of two cows and sixteen sheep, with potatoes, and in former days, bere or oats, locally milled by the three Gravir water mills, could scarcely ever have maintained a family. Fishing was the complementary economic activity, and in 1901 no fewer than nineteen boats and
[228] eighty-nine fishermen were registered at Gravir. Today, only one boat fishes commercially for lobsters.

463 If agriculture is singularly unrewarding, weaving occupies six of the males of insurable age and
288 service occupations a further ten males and five females, but neither weaving nor service occupatio
are sufficiently available or attractive to keep the insurable population in the district. Twelve of
[166] the males between fifteen and sixty-four years take seasonal employment and forty-six are in
[167] permanent employment furth of Lewis, in all sixty per cent of the potential male resident population.

175 The economic problem of Gravir, in common with the other 'fishing' townships, became acute
228 after the fishing industry collapsed after 1914; in the hey-day of the fishing most of the men fished
434 all the year round, locally and on the west and east coast of Scotland. Earnings fluctuated but a man might make as much as £90 in a good year or as little as £5 in a poor year. Apart from the sal of young cattle, and wool surplus to home spinning requirements, the fishing earnings constituted
[293] the bulk of the croft income. Today, on the basis of the souming, the income of the largest croft including subsidies could only be approximately £150 excluding the amount to be set aside for home consumption of potatoes and milk.

175 sufficiently to make age controls an irresistible force, the
178 prestige status of the small number of the "elect," those
183 who had experienced a saving change, and, in particular, the
793 elders gave them complete control over all social and religious
539 activity. In a later chapter I shall have more to say about these facts. The important fact which I want to emphasize now is that the religious patterns provided a framework in which the culture could find continuity and through which the society could achieve a reintegration. The abhorrence of pagan-like customs resulted in a change of content, but there were positive results as well. Above all, there was a change in
604 focus for the culture and society. The decadent belief in clan brotherhood was replaced by a sense of belonging to a known religious brotherhood.

175 Summary. The third period of the modern phase of Skye's
178 culture history saw the culmination of the process of
427 commercialization of the land. All the influences necessary
423 for the conversion of the subsistence economy, albeit a much
233 deteriorated economy, had begun to function. Sheep farming, on a commercial scale, formed the basis for the new economy.
167 Newcomers with the incentive and ability to introduce improved
187 methods of land utilization were replacing the conservative
301 and impoverished crofters and cottars. As the commercial
628 farmers consolidated their holdings, the communal townships
550 were being obliterated. The concept of individual possession of the land was replacing the customary rights of the small tenants, and a clearly defined social hierarchy, based on

175 crofting system. Both the communal nature of the system and
177 the smallness of the crofts deter improvement. Although the
427 government reversed the trend toward making the land an im-
24 portant source of wealth and individualization of the land, by
183 replacing customary forms of tenure with national laws of tenure, and has tried to correct the disadvantages under which the crofter labors, if not always successfully, the Skye crofter has made only a partial adjustment to the larger,
301 specialized national culture. In fact, the land is used less
314 systematically than it was in the past, in the times of the shielings. The crofters have not only ceased trying to reclaim arable but also have allowed much of the arable to go back to grass.

175 Ever since the closing years of the first period of
178 the modern era, Skyemen have sought employment as a part of
464 the national labor force. During the third and fourth periods, they joined the landless labor force in the Lowlands. There is practically no local opportunity for a landless man to support a family. The majority must remain pastoral agriculturalists who depend on seasonal employment, or some other form of financial assistance, to augment their income.

175 Improved communications and the ensuing development
178 of commerce has brought a village to the island. It functions
361 as a market center and as the administrative center for the island. It has not served to bring the island together; it is still something alien to their heritage. Accompanying the growth of the village, there was local development in the

stock grown for local household consumption and export but 241
also the subsidies and grants provided by the national govern- 231
ment. I hasten to add that it is impossible to estimate 651
accurately the specific contribution of crofting to the 657
economy of Skye. There is no available means of distinguishing the status of crofter from that of farmer in the annual returns of crops and stock or in the applications of farmers and crofters for subsidies and grants. Before getting down to pounds and shillings, we may find a brief digression to review the acreages of land devoted to crop and stock raising and the yields to be expected helpful in our attempt to understand the many problems under which the Skyeman labors.

The total area of Skye is approximately 447,000 acres. 311
Of this area, 422,415 acres were classified, in 1953, as rough 190
grazing.[7] The land under cultivation, excluding grasses, 233
was only 3,254 acres. There were 6,258 acres of grass intended 241
for use as hay and 12,339 acres of permanent grass or improved pasture. The remainder, about 2,500 acres, was unclassified.

The stock, in 1953, was 1808 dairy cows and heifers, 231
8,108 cattle, 143,422 sheep, 41,888 fowls, 436 horses, and 319 pigs.[8] The dairy cows are mainly beef breeds which give a low yield of milk. The sheep are primarily the hardy blackface variety but some crofters have cheviots, which produce a finer wool. For each sheep there are about three acres of grazing

[7] Agricultural Returns, June 4, 1953, Department of Agriculture for Scotland, Edinburgh, Scotland (in the files of the Department). These figures include adjacent small isles.

[8] Ibid.

241 where the population has suffered the greatest decline and,
161 therefore, where enlargements, by legal or illegal means,
433 have been the most extensive, crop production has declined the most. Nor has the decline in population, accompanied by land redistribution, altered the fundamental problem.

427 The cottars (subtenants) have almost disappeared there-
24 by easing the excessive pressure on the land and removing the threat of recurring destitution. Today they are found only in a few scattered dwellings and isolated clusters. Most of them have secured some form of employment or have reached the age when a government pension is sufficient to satisfy
427 their needs. The number of crofters, on the other hand, has
241 increased. If the figures 2043 and 1227 can be accepted as
161 nearly correct for the respective numbers of crofters and
162 cottars in 1886,[15] they have increased at the expense of the latter and, also, the sheep farmer, whom they have replaced.

632 To briefly summarize the foregoing discussion of the
621 township, let us look at Kilmuir. Table 3 shows the number
161 of crofts and crofters in each of the nine townships together
162 with the acreage and "souming" rights available to each indi-
241 vidual. Although replanning during the past fifty years has
231 benefited many of the local residents, crowding upon the land
311 is still apparent.

TABLE 3

161 CROFTS, CROFTERS, ARABLE ACREAGE, AND SOUMING RIGHTS
162 IN THE KILMUIR TOWNSHIPS

241 Township	Crofts	Crofters	Arable Acres[a]	Common Grazing	Souming
311 Bornesketeig	47	35	4	273	2 cows, 1 calf, 12 sheep
Hungladder	14	9	5	236	2 cows, 1 calf, 10 sheep
Balgown	4	5	13, 14, 32, 46, 86	177	4 cows, 4 calves 26 sheep
Kilvaxter	12	11	27	...b	4 cows, 4 calves 26 sheep
Linicro	19	17	15	729	5 cows, 5 calves 40 sheep 1 horse
Peingown	3	4	18	187	7 cows, 7 calves 20 sheep 1 horse
Herbusta	8	8	12	308	3 cows, 3 calves 26 sheep 1 horse
Totescore	12	13	21	500	3 cows, 3 calves 20 sheep 1 horse
Monkstadt	3	3	27, 27, 5	420	9 cows, 9 calves 40 sheep 2 horses

[a] Arable acres are given in average acres per holding, unless otherwise indicated. Except in Bornesketeig and Hungladder, arable land includes outrun, improved pasture land individually held.

613 Sources: Compiled from The Valuation Roll of the County of Inverness, 1953; information extracted from the files of the Department of Health for Scotland; and data supplied by the Department of Agriculture for Scotland.

621 from the ways handed down from the past. We might note at this
632 time that even the progressive crofter is not always quite en
621 rapport with modern techniques. There was, for example, a man
233 with two calves infested with liver fluke. Convinced that
178 medicine was the only solution, and equally convinced that a person cannot believe everything he reads, he obtained a bottle of liver fluke medicine which was plainly marked: "for sheep only." When asked how his calves responded to the treatment, he responded, "Och, they both died."

632 Because of the restrictions which the township system
621 imposes, there has been a growing, perceptible rumble of
178 agitation for supplanting unanimous consent with majority rule. Few, however, would go as far as a retired seaman who returned to Skye after forty years. He would like to see the township system abolished. Another small group believe the Sgiathanach would be better off if the Island were given over to communal farms. Most seem to favor the continuation of the present system. Of course, the majority is composed of the conservative old men.

The Aged and the Absentee Crofter

241 No appraisal of the crofting system is complete without
427 a discussion of two additional factors which have affected the
887 use of the land and the present unsatisfactory economic condition
311 of the Island. One of the factors is the aged tenant, who, as we have just seen, exercises a strong control over the younger men through township government. He has also influenced

241 the economy by subjecting many fertile acres to disuse because
427 of his infirmity. The other factor is the absentee tenant,
887 an individual who has obtained possession of a croft, normally
863
• 311 by inheritance, but who has failed to take up his inalienable
[128] rights of tenancy. Let us very briefly review the economic trends of the last fifty odd years and, then, try to assess the importance of the absent and the aged.

436 Although the Sgiathanach has refused to become a
433 specialist, fully involved in a money economy, he has become
241 increasingly dependent on the products of the wider commercial
178
437 society. Long ago he gave up growing the old staples, barley and oats. Not for many years has he grown enough potatoes or turnips to feed himself and his cattle. In place of these home grown subsistence crops, he now imports a great deal of his food. In an average year Skye imports over 700 tons of bread, 10 tons of vegetables, 300 tons of canned goods, 300 tons of potatoes, 500 tons of flour, and 100 tons of milk. To pay for these products, he exports cattle, once his only marketable produce, and an ever increasing number of sheep.

436 Hance, writing about the Outer Hebrides, sees the growing
241 tendency of the crofters to buy their food as indicative of an
233 increasing cash income.[16] To a certain extent, this may be
437 true. There are, however, additional factors involved. Ecological limitations have played their role. That the climate and soil together make Skye a grassland suitable for stock breeding rather than an island fit for cultivation is an often repeated

[16] Hance, The Outer Hebrides in Relation to Highland Depopulation, p. 62.

427 of the holders reside on their land for more than half the
241 year. The lowest rate of absenteeism is found among the tenants
162
of the Department of Agriculture. There are 76 absentees out of a total of 667 tenants. Most of the non-resident crofters are permanently absent. On the small estate mentioned above thirty-seven of the forty-two absentees have not been seen in years. Five of them usually return to Skye to spend their summer vacation.

427 Thus, we have a situation in which, perhaps, a third
241 of the crofts are held by people who either cannot work them
• 311
887 because of old age or infirmity, or do not choose to work them because of greater opportunities elsewhere. What, then, happens to this land? Some of the old people allow a neighbor to use the land. Almost invariably this means the few fertile acres will be used for grass and hay. Absentees "entrust" the
[67] croft, house and land, to a landless family. While Parliament inadvertently gave the crofter a right to keep his holding whether he resided on it or not, it is illegal to sublet. So far, this has not concerned the crofters. Other absentees "entrust" the land to someone in the township who uses it for grass.

427 Turning to the influence of old age and absenteeism on
863
stocking, we find a series of entanglements. If the township is
231
inhabited solely by old people, like Aird in Sleat, the township becomes derelict. More commonly, the absentee and the old person allows someone else to take over his "souming" so
[32] that some crofters have far more than their share. Not infrequently, this gives the crofter a chance to outwit that

312

131 Lewis is about 40 miles long. The distance from Stornoway to the west side of the island is about 15
361 miles. Along a tar-macadam road through Barvas parish
491 from its northeast tip toward the southwest, about 18 villages are clustered along a relatively flat coast for as many miles until the land becomes hilly. The road then narrows and takes hairpin twists around blind,
361 stony corners. Villages become fewer, and nestle in protected coves or string haphazardly across the face of the hills.

Shawbost (from the Norse sjá or sjó meaning "sea"
[632] and bost or bolstadhr meaning "dwelling" or "homestead"), a village in the parish of Barvas, lies on three low hills on the west coast. Shawbost is 18 miles from Stornoway on a circular route in which Stornoway and Shawbost are antipodes.

172 On the south side of Shawbost bay, huddled beside the sea strand, is a cluster of ruins called Sean Bhaile (the old village), believed to have been occupied over 200 years ago when fishing was important in the local
[348] economy. Banks of the streams are dotted with the ruins of old grinding mills and ovens for drying grain.
• [312] Fresh-water springs are still kept clear of rushes, although water is now piped to most houses from a nearby
000 loch. Hundreds of place names are known to the villagers

121 being determined by conditions of culture, such as
121 political and economic conditions. Under conditions
178
182 of gradual centralization of economic and political systems, the geographically marginal crofting areas have evolved strategies, some of which puzzle agencies concerned with development or other aspects of governmental process.

178 Before the North of Scotland Hydro-Electric Board
365 began to operate in the crofting counties, not more
511 than one croft in every hundred had electricity; but by the end of 1951, one in every six holdings had been supplied (Taylor 1954: 20). "The light" came to
[354] Shawbost in 1951. Before then, the islanders used
[779] Tilley lamps, a Canadian invention; and before then,
• [312] double-wick paraffin lamps. Piped water came a few
[464] years later, around 1955; it was brought from a nearby loch, and the construction work gave temporary jobs to local people. The availability of these services
[344] facilitated the building of county council houses,
[342] which many welcomed as providing a relief to the congestion caused in part by rules against building more than one house on a croft. But, paradoxically,
[651] with larger, better homes and all these services came a decrease in the advantages of living in a crofting township: property was assessed and people began paying rates or taxes.

the traditions of the past. I shall discuss this further 594
I describe the extended family.

Township. The township is a cooperating economic unit. 621 632
munal use of an interest in the common grazing lands gives 233
township its focus. Living on the several crofts, there 311
be found an aggregate of nuclear families and unmarried
ividuals who, especially in the older townships, are related
re-related on both sides. Only in the more modern townships
the degree of relationship become tenuous and finally dis-
ear. In interpersonal activities the neighbors have a rate
interaction second only to that of the nuclear family.

The dominant social trait is the strong emphasis on the 621 594
ription of status on the basis of kinship, sex and age.
re are no socially valued achieved statuses. The facts
simple. Males enjoy higher prestige than females, and the 54 621
men and women are respected by the youth. All of the same
grade and sex are essentially equal. Again we have a
allel with the Irish small farmer.[18]

There is no room for the expression of a role of leader- 621 632
p in economic activities. The governing principle of 594
nship administration is so-called primitive democracy. All
es have an equal voice in determining the acceptance of
policy or action which concerns the group, and unanimous
sent is necessary for the adoption of any change. Al- 624
ugh each township has an elected grazing clerk and a grazing

---

the dung from the byre, the peats from the moor, and the oats from the fields. When the land had been turned by caschrom, they yoked themselves to a harrow. The crofters, in Kilmuir, as elsewhere, lost the right to the rivers for fish, to the moors for game, and to the coast for sea weed. The land became exhausted from over tillage. They had clung tenaciously to the old methods. Even if they could have obtained credit and could have broken with the ways of their forefathers, the fear of rackrenting would have deterred them.

A degree of preciseness can be given to this general picture by comparing the arable acreage and stocking of Skye in 1810, the year graziers first appeared, and 1870. In 1810, 30,000 acres were listed as arable, either cultivated or susceptible to it; there were 18,000 cattle and 40,000 sheep.[66] By 1870 no more than 8,383 acres were considered as arable; there were only 9,341 cattle, but there were 136,077 sheep. The magnitude of this change can be emphasized by adding the fact that there were less than 14,000 sheep on the Island at the turn of the century.[67]

The end of the shieling life brought an end to the traditional season for courting. Destitution forced a postponement of marriage and an absolute reduction in the number of marriages. As a natural consequence the birth rate declined. In the decade 1861-1870 the birth rate of Skye stood at 26.1 compared with 34.9 for Scotland.

TRADE AND INDUSTRY

824 useful crofting ancillary which, unlike many others, is soundly
381 based on a definite commercial demand. Various industries use the extracted acid for some 150 products. The Scottish alginate industry, the second largest in the world, is based on the process of E. C. Stanford, who discovered alginic acid in 1883, though today modern methods are used. For raw materials it has turned to the old kelping shores of the Hebrides and Northern Isles. On the island it has a factory at Keose on Loch Erisort, a site chosen for the easy access afforded to puffers; the factory receives the weed, dries, mills and bags it, and the boats then carry 200-ton loads to Girvan. The factory itself involved some £30,000 of
[433] capital layout and has a capacity of 120 wet tons per week—4 wet tons producing 1 dry milled ton. About a dozen Harris and
[137] Lewis crofters gather the seaweed crop, the most useful type being bladderwrack or rockweed *(ascophyllum nodosum)*, from the shores at Loch Erisort, East Loch Roag and Bernera in Lewis, Husinish and Scarp in Harris, and Loch Seaforth. Where there is
[493] road access the weed is cut by sickle and loaded into a lorry, but more often it is cut at low water to be floated with the incoming tide and rafted to Keose, hauled by motor boat.

241 A product of the land not readily associated with the Hebrides is bulbs. Bulb-growing deserves a mention, however, if only be-
[803] cause the experiment to see whether it could become a commercial possibility in Lewis was carried out by the children of Lionel (Ness) Junior Secondary School. The MacAulay (Rhodesia) Trust made an investment of £150 to cover initial expenses, and success followed. When the original project was completed it was extended, sales bringing the school a useful sum. But an attack of disease brought production to a standstill in 1966.

• 312 Another small industry is the aerated-water plant at Ness, which is operating with reasonable success, and could do better if
228 imports of aerated waters from abroad were reduced. A number of recent surveys made in the island have found great interest in such activities as shell-fish processing in Harris to produce semi-
286 preserves, using mostly cockles and mussels. Local knitting already has a name for its products and a potential for extension on a
* [175] commercial scale; this latter began in late 1966. Some forty years ago knitting specialists went to Lewis to investigate the possibilities

HEALTH AND HOUSING

ing to put their houses into better condition. The leases required, 175*
inter alia, that the thatch was not to be stripped off or removed 342
for manurial purposes; that the byre was to be a separate build- 429
ing; and that the dung was to be removed regularly to a distant 144
dung-heap. A Sanitary Inspector's Report for 1896 noted that the [231]
new houses being erected were following the old traditional patterns. And though the introduction of statutory requirements did
bring real improvements, as late as 1902 it was reported: 'The in- [165]
sanitary houses and the impure water to which the people have long been accustomed, would lead an enquirer to expect a high death-rate. That is not so, however. The island is occasionally [164]
visited by epidemics of measles, or whooping-cough, like other parts of the country; and there are sometimes outbreaks of dung-fever—a preventable malady—but altogether the general health is good."

The Sanitary Inspector's Report for 1898 described certain 175*
water supplies in the island as 'little better than cesspools for 312 •
surface soakings'. And five years earlier the water supply of Cromore was 'merely a few holes dug out amongst the arable land next to the houses; and polluted with the manure dissoved off their arable ground; and in some cases contaminated with liquid sewage percolating through the soil from their houses.' In 1893
an outbreak of typhoid fever in some townships in Uig was traced [164]
to the contaminated stream whose water was used as a drinking-water supply. Improvements in the water supplies were eventually put into effect, with a marked decrease in the ailments which the people had come to expect as normal to their way of life.

The rate of infant mortality was high. The weaklings died 175*
young. Only the strong survived to withstand the insanitary sur- 165
roundings. A peculiar form of disease was associated with the 164
island: it seized a child about the fifth night after its birth and was consequently called the 'fifth night's sickness'. According to medical opinion this was infant lockjaw *(tetanus neonatorum)*. The doctor of Lochs in 1892 reported that it was common among the infants of his parish, being 'most frequently met with in those dwelling houses where sanitation in its most rudimentary form is entirely ignored; where we have to walk to the fireplace in the

ISLAND LIFE

365 company gave way to the North of Scotland Hydro-Electric Board.
*175 In that year there were 1,063 consumers, all within the Stornoway burgh boundaries. With its social remit, the board started on bringing power to rural areas, even where uneconomic. Lighting
[354] in the crofting townships was mostly by oil lamps, mainly the hot-mantle type (the 'Tilley'), but by 1960 the number of electricity consumers had reached 8,124, and the present number is about 96 per cent of the potential. Harris received its supply in
377 1954. The generating station is at Stornoway and employs diesel-
*175 engined units as prime movers, with an annual output of some 22,000,000 units. In August 1960 the Gisla scheme came into operation, the island's first hydro-electric plant; designed to produce some 2,000,000 units annually, it harnesses the waters of the Gisla River, which flows out of Loch Grunnabhat in the parish of Uig, Lewis. The station has a capacity of 540 kW. The other hydro-electric scheme is at Loch Chliostair in North Harris, planned to produce about 2,400,000 units annually.

• 312 The provision of water and drainage is still on the drawing boards for a number of crofting townships, though work is progressing for others. The Uig water scheme has cost some £100,000, a relatively large sum for a small population and amplified by similar work for drainage schemes. This scale of public expenditure must continue if people are to stay in their native villages and not migrate to Stornoway or leave the island altogether. Stornoway's new water scheme has cost something in the region of £160,000, but is vital if the town hopes to attract industry. The original burgh water supply was started in 1846 by Sir James Matheson and a few businessmen. The capital of the Stornoway Water Company was only £800, but it gave the town a gravity-feed supply from the nearby Loch Aridh na Lic long before many larger places on the mainland had considered such projects. Heavy floodstorms destroyed the old dam in 1933, and a new waterworks at Loch Mor a Starr was opened in 1937. As Stornoway extended the old loch had outlived its usefulness; for many years there had been difficulty in getting water to the higher parts of the town, particularly during the heavy fishing seasons when the fishermen drew off large quantities.

231 summer, were last used for cattle six to eight years ago by people in Brenish, but none are in use today. These shielings were at the western foot of Mealisval, only about a mile from the township. The Brenish 'distant' shellings, about six miles to the south-east of the township across the mountains, were not used after about 1920, while the adjoining Islivig shellings were last used in 1922. Mangersta may have had its original shellings to the east of Loch Melavat about a mile south of the township, but after obtainin the enlargement from Mealasta farm,until about 1939, shellings were used in that area.

314 No peats are cut on the crofts; the peat-cutting areas for all three townships are nea
241 the road and in no case far from the township. The common pasture near the crofts bear evidence of former cultivation, but it is at least fifty years ago since crops were grown o it. At this time the townships of Islivig and Brenish were over-populated with many cottars living on the crofts and all possible land on the crofts was already under cultivatio Today, less than half this 'old arable' is being cultivated, and in several cases the land is used solely for hay and grazing.

342 There are now no thatched houses inhabited in the townships and most houses have kitchen and other extensions added. Some crofters have built concrete two-storey byres
• 312 of modern design. In Brenish, where the hills to the east provide a good catchment area and the Brenish river a good source of supply, all the crofts have their own private piped water supplies, while in Islivig and Mangersta most crofts now have, or are getting, a
377 water supply. All croft houses are supplied with electricity from the grid.

226 Commercial fishing has long ceased and as there are only three boats there is now ve
301 little fishing for domestic use, the principal use of the boats being to ferry sheep to the off-shore islands. Weaving is an important occupation. There are seventeen weavers -
286 nine in Brenish, two in Islivig and six in Mangersta, and during 1959 they were kept bus
464 in 1958, however, few orders were received. Weaving cannot be said to bring in a stead
[834] income here, and some of the weavers, and others, find additional employment outside the township - this includes four men at the hydro-electric scheme at Gisla, three at Mangersta Ministry of Civil Aviation station, three at Aird R. A. F. station and at least
467 one in the Glen Valtos quarries. In addition, one man owns a tractor which he hires
[448] out, and one, owning a lorry and van, does haulage work. Altogether, out of a total of twenty-seven men under sixty-five who do work, all but three (one just out of school and one a semi-invalid) have other employment in addition to their crofts.

162 The total population for the three townships is one hundred and twenty-one residents, and fourteen permanently away from home. Of the residents, twenty-eight (or 23%) are children of, or below, school age, forty-seven (39%) are in the 15 - 45 age group, 15 (12%) are in the 45 - 65 age group, and 31 (26%) are over 65. Of the resident tenants, thirteen are over 65, twelve under 45, and five between 45 and 65.

181 The relatively young population may help to account, together with the better soils, for this area giving an impression of a fairly prosperous crofting district compared with some of the others in Uig. Amalgamation of crofts into larger units has also gone furthe The use of a tractor or horse for ploughing, extensive use of artificial fertilisers, the sowing of grass seeds and the sale of sheep for meat, all seem evidence of a group of people who are determined to make the most of their limited resources.

233 One enterprise, that of the Aird Bheag sheep farm, deserves special mention. Four crofters (three from Brenish and one from Islivig) have purchased from the Uig shooting estate about 2,000 acres of land on the Aird Bheag and Aird Motre peninsulas, five miles south of Mealasta. Here they are running a flock of about five hundred sheep. There is

361 Many of the original houses are ruined or used as byres. Figure 14 shows that new
491 houses have been built near the sites of the old ones but sometimes nearer the road - all
487 but four houses have easy access to the road. Crowlista is linked to the main road by
495 two miles of rough gravel side-road, and by a footpath and ford via Timsgarry. Vans call
365 but there is no Post Office, store nor bus service. At present water supplies are poor -
362 two wells only are in use.
489
312

Carnish is served by a short unmetalled road and all houses have good access to this. Water supply is good; water may be stored on the high part of the crofts and piped into the houses. The roads serving Timsgarry too, are unmetalled, but the main road is less than a mile away. This 'main road' from western Uig to Stornoway runs through Ardroil and all
366 except one of the houses not near to it have good drives suitable for lorries. Ardroil has
365 a store and Timsgarry a Post Office. One butcher's and two grocers' vans call weekly
453 and the travelling bank fortnightly. The thrice-weekly bus service to Stornoway (return
498 fare almost £1) ceased in 1960 because of competition from privately owned vans and cars.

241 The cultivated land is in strips usually large enough for horse or tractor work; the
23 smaller potato patches are hand dug. Few horses are kept now, Timsgarry, Ardroil, and
407 Carnish have one each and Crowlista none. Crofters hire these horses or tractors from Brenish or Enacleite. Oats and potatoes are the only crops grown in quantity, small patches of turnips are found and most crofters grow root vegetables. Kale was seen growing on one Ardroil croft; this was an experiment and seemed to be very successful. Bere and rye are no longer grown. Grass mixtures are sown in order to qualify for cultivation grants. Oats are undersown, or grass seed may be sown after the oat harvest, and left for hay for several years - some sown twelve years age was said still to be giving very good hay, but on the whole very little grass is sown in Crowlista. The acreage of natural grass cut for hay varies a good deal with the weather and the time and labour available. Crofters find this difficult to estimate as well, as often small irregularly shaped pieces are cut, and the figures, therefore, may not be accurate. (Appendix A).

One excellent garden showed that a rich variety of vegetables, fruit and flowers can be grown if adequate shelter is provided and the time for cultivation is available, but few crofters have the necessary knowledge or interest.

242 Lime, dung and artificial manure are widely used, though on some Crowlista crofts
134 the compound fertilisers were in use for the first time in 1959. Shell sand is used on the
324 crofts which have peaty soil. Although it is spread on Ardroil and Carnish and dung is the ideal fertiliser for potatoes, seaweed is only occasionally used. It is becoming difficult to obtain locally and much heavy work is involved.

231 Each of the thirty-five operative units which carry any stock at all has a cow for domestic milk supply and manure. If the family is large or many visiting relations stay on the croft during the summer the calf has to be sold early; otherwise it will be reared until the cattle sales in September or May. Only eight crofters had two cows; fifty years ago four were commonly kept. Only thirteen of the units had young cattle other than calves. One crofter was rearing a kid for milk.

The bull supplied for these townships and Mangersta is an Aberdeen Angus which is wintered on the Ardroil machair.

233 It was sometimes difficult to obtain factual information about sheep and it is difficult to generalise. Operative units without sheep were those where no suitable labour was available. In a few cases crofters considered that sheep were 'not worth the trouble' - but others were building up their sheep stocks. Individual flocks ranged from ten to two

133 The 1,700 acres of common pasture stretch to the east and west of the crofts, across
231 the peninsula which terminates in Gallan Head, extending to those of Crowlista and Valtos
654 in the south. The whole coast is broken and rocky, the land inland is peaty, and Aird lacks the advantages of the machair land found further west. To the north of the village there is now an R.A.F. radar station on Rudha Caol, built on what was part of the common pasture. It dominates the landscape and makes a considerable difference to the life of the inhabitants.

361 The township, though isolated, is reached by a good road which leaves the main road
491 at the western end of Glen Valtos. Grocery vans call on Wednesday and Friday, a
493 butcher's van on Saturday, and the local people are also allowed to shop at the N.A.A.F.I. within the Camp. The road through the village approximately follows the line of the 100 ft. contour and all the houses are built directly on to the road, with byres, weaving sheds and other buildings behind, whilst in most cases hens are kept on the steeper slopes below the road. Thus the settlement has far more of the appearance of an English village than
365 have most crofting townships, but there is no shop or post office. The majority of the
342 houses are stone with slate roofs and fairly large, though some of them have been built for
3.59 more than fifty years. All have electric light and their own water supply and several have
312 modern byres.

There are ten crofts, as the enlargement of one of the original nine was subsequently
427 split off to make a separate croft. Of these, one tenant is an absentee and another an
311 elderly woman who does no cultivation. In both these cases, grazing is let to others so
491 that there are actually eight operative units. The crofts are fenced in their upper portions, but in most cases the fencing does not extend down to the river and there is free access to the single concrete footbridge which spans the stream.

The only crops now grown are oats and potatoes and a few vegetables, with some sown
241 grass; natural grass provides most of the hay crop. Lime and shell sand and artificial fertilisers are used; the two former particularly on the ground near the river where the cultivation is in narrow strips separated by drainage ditches and ploughing is done by horse.
407 Most of the cultivated land is on the gentler slopes behind the houses, where the use of a
242 tractor is possible. Before 1914 most of the land within the original turf dyke was culti-
324 vated; bere was grown and ground at the mill for meal for barley bread. Seaweed was
23 extensively used as a fertiliser and most of the families kept eight or nine cows, so that there was a more plentiful supply of manure. Now, six of the families each keep one cow for domestic milk supply (two of the others each keep a goat). The township possesses no bull, but make use of those at Valtos or Ardroil.

233 On the other hand, the sheep soum is generally exceeded; instead of the entitlement of about 200, the total flocks grazed on the township pastures are approximately 500. The lambs are weaned early in August and put on Rudha Caol (Air Force use has not prevented this) and wedders are usually sold at the age of two or three years in Stornoway - many in October to reduce the numbers that must be pastured during the winter.

162 The total resident population of Aird consists of fifteen males and sixteen females.
Of these, twelve are over 65, six are aged 45 - 64, 11 are in the 15 - 44 age-group (there are only three married couples) and there are two children under 15. Nevertheless, most of them are complete families; only one person lives alone; no members are reported as
166 periodically working away, no men and only two women are permanently away. Neither has there been much emigration since 1939 - five women only have married out of the parish. The tenants of seven of the crofts are over the age of 65, the only one in the 15 - 44 age-group is a new-comer to the district and does little croft work.

432 strips running across the slope, which are interchanged each year, whilst a large part of
427 the common grazing lands are divided into interchangeable sections ("quarters") to
311 accommodate each of the groups of crofts. See Figures 22 and 23.
233
133

The cultivable croftland at Kneep is relatively flat and the natural drainage is poorly developed; the quality of this land, depends to a very great extent on the upkeep of a dyke
5 312 running across the croftland from a small marshy loch to the sea. This dyke has not been cleaned for several years, and as a result a large area has been invaded by reeds. Other parts of the croftland have been similarly overrun by 'wild rhubarb'. Such deterioration is almost inevitable when land is so fragmented.

The crofts at Reef are grouped in three separate localities. Crofts 1, 2 and 3, on the edge of the machair have probably never been occupied since the crofts were allotted in 1921 and are now used only for grazing. The main body of the crofts (nos. 3 - 13) face south - they are more compact than those in Valtos and Reef, but they vary in size from 2.9 to 13.25 acres and their boundaries are irregular in shape. Two crofts (14 and 15) are separated from the main parts of Reef: they are both small (2.5 acres) but the size is compensated by their situation on the level terrain of the machair. The old farm house
241 is used as the dwelling for both 14 and 15. Much of the cultivation at Reef, except on the
407 machair crofts, is on lazy beds - but many of these have decayed with the advent of horse and tractor ploughing; 35% of the land is cultivated by spade, and the remainder by horse plough.

The crofting economy is probably at its lowest ebb in Reef. Only eight of the fifteen
433 crofts are occupied and of these five are worked by disabled crofters or crofters over
728 sixty-five. The Reef crofts were granted in 1921 by returning ex-servicemen and today seven are being worked by the original settlers; there is little evidence of a desire among the younger generation to succeed to the crofts.

233 Until 1956, crofters on Reef used to graze both sheep and young cattle on the Flannan Islands, fifteen miles west of Uig.

Fig. 24 shows the age/sex structure of the population in the three townships. It tells
162 a story familiar to crofting townships: 55% of the resident population are over forty-five years of age; 9% of the total population are permanently away; and since 1939 the population has declined by at least 15% as the result of emigration alone. But perhaps the
163 most significant fact is the very small proportion of women of a child-bearing age and the consequence that only three children are being born each year to replace the older generations.

131 By their very position, the townships of the Valtos peninsula are isolated. Fifty years
20 ago communication with the rest of Lewis was by boat. The road to Valtos and Kneep was built originally to bring the mails from the pier at Meavaig; the motor road to Reef was completed in 1956. Shopping facilities are provided at Valtos, for the people at
443 Valtos and Kneep, and at Meavaig which serves Reef, Uigean and Cliff. These are supplemented by travelling shops which call once per week, by Indian dealers and by the local 'bus-driver who makes purchases in Stornoway on behalf of customers on the
346 peninsula. The school for this whole area is situated mid-way between Cliff and Valtos and two kirks and the doctor's house lie at the junction of the Valtos and Reef roads.

175 beginning of the resettlement movement which has given the modern crofters of the
342 district almost all the lands formerly occupied by small tenants. This process was completed in the Bernera region soon after 1918, and the problem now - one which is obviously going to become increasingly important - is not to give the crofters more land but to find active crofters for the existing holdings (see Chapter III for more detailed information on clearance and resettlement).

361 The ground plans of the existing settlements vary considerably, depending mainly on
653 the terrain. Where a township is spread along a fairly straight coast the natural
427 tendency is for the croft boundaries to run at right angles to the coast and for each house to be set on its own croft. The best examples of this are Hacklete and Kirkibost, where an early nineteenth century (i.e. pre-clearance) lotting was readopted when the township was re-settled in 1878. Linshader, Lundale, Cruiliveg and Earshader also follow the same type of layout as nearly as possible, but Tobson, with the exception of Valasay, is intermediate between a lotted and an unconsolidated township. Croir also differs: it was laid out in 1921 but the disposition of the potential arable forbade a coastwise organisation. The site of Breaclete is greatly broken by lochs and a sea inlet, and consequently an essentially regular layout based along a main Loch Breaclete - Loch Beg Breaclete axis, appears somewhat complicated. The accompanying diagrams contrast the control exercised by physical conditions at Croir with the subordination of physical conditions to a simple lotting plan at Hacklete, (Figure 28).

Within the township, with the exception of Kirkibost, the distribution of settlement
361 seems to have changed little since the original lottings, for in most cases the sites of the
342 old and present dwellings are little further apart than is dictated by constructional
178 problems. It would appear generally that black houses were universal in the nineteenth
632 century except for the farmhouse at 1 Croir (the oldest 'white' house in Bernera), Thula House, (18 Tobson), possibly the tacksman's house at 11 Hacklete, the former farmhouse at 20 Kirkiboat and at West Earshader. However, with the establishment of Congested Districts Board and of Board of Agriculture grants, housing was improved, early examples being 5 Hacklete and 10 Breaclete. The resettled townships generally had improved accommodation from the start. Improvement has greatly accelerated since 1951. In most cases at the present time housing is of very high standard, only one blackhouse and one near blackhouse are still occupied.

312 Water supplies and sanitation are less satisfactory. Most crofts by now have their private water supply, thought it is hoped that mains schemes may be constructed within the next few years. Sanitation varies in standard and in places there are still open
654 ditches, but all the newer houses have water closets. It is worth remarking in this connection that tuberculosis is almost eliminated. Electricity has been available since 19
351 to all crofts and most are connected, though not necessarily in every room. Cooking is sometimes by electricity but more commonly by Calor gas and a peat-fired range or stove (open or enclosed). Peat is now the fuel in use for those able to gather it themselves. Where, however, help is needed to carry the cut and dried peats to the nearest road, difficulties may arise. The cost of hiring labour for peat cutting may be such that it is cheaper to buy coal.

491 Access to Bernera by road is now comparatively easy. Where formerly Loch Roag provided the highway of communication, the road built to Earshader after the Great War
494 and the £87,000 bridge to Bernera Island, built in 1953, have caused a revaluation of sites. Linshader is approached by a tarred branch road and the other Bernera shore townships lie upon the narrow and twisting main road, though four of the six Lundale crofts have no connection with it, and two of the Cruiliveg crofts, and West Earshader, are somewhat isolated. On Bernera Island the old cart track from the pier at Barraglom across to Tobson and Croir has been somewhat re-aligned since the construction of the bridge. This is a good tarred road, as is part of the branch to crofts 3...8 Croir. The old road to Kirkiboat was tarred in 1959, though three outlying crofts near Barraglom were still without a road suited to vehicles, and the branch within Breaclete remained untarred. There is a new road to Hacklete from Breaclete which provides tolerable though circuitous, communication. Valasay is one of the most isolated settlements in Berners, linked with Breaclete rather than with Tobson by the footbridge and causeway paid for by Congested Districts Board grant about 1903.

CROFTING CHANGES

of larger and more economic working units of over 30 acres of 241
arable land is also apparent in the southern Hebrides, the west 311
mainland of Ross & Cromarty, Argyll (mainland and islands) and 178
Caithness.

The acreage of common grazings held per holding varies from
under 50 to some 200. The crofts, as already mentioned, are in [832]
townships, of which the island has 168, half being fenced and
half consisting of individually fenced crofts. During the winter
most of the crofts are laid open for winter grazing by sheep of
general ownership. Manure resources are mainly dung, seaweed,
shell sand and of course artificials where necessary.

A new aspect of crofting in Lewis is its extension into forestry. 311
A recent survey by the Forestry Commission indicated that under 313 •
400 acres of the land not being used for crofting were suitable for 178
afforestation, and that these acres were made up from twenty-
three different plots. At Garynahine Estate can be seen the begin-
nings of a real afforestation unit of some 500 acres, a scheme of
the utmost significance for the economic future of Lewis and for
the relationship between crofter and landlord. Too often in the
past this relationship has been biting, hard and inflexible; in
particular the crofter was understandably unwilling to release
good land for planting trees. But the crofters of Callernish agreed
that the right of usage of 285 acres of the common grazings be-
longing to their township should revert to the landlord, this land
being thrown in with 220 acres of the Garynahine Estate. Labour
comes from the affected township and others in the area.

FISHING

Early beginnings

It is the humble herring that has contributed so much to the 226
island's economy and its history. At a very early date in history, 175*
the Hebridean fishings were worked by Frenchmen and Spaniards [648]
who must have found them rich enough to repay the long journey
and weeks away from home in the cold Minch waters. It was not,
however, until the end of the sixteenth century that the wealth of
the Minch was really discovered, this time by the fishermen on
the mainland of Scotland who copied the tricks of their trade

LIFE TODAY

LIFE TODAY

As in other Highland areas, some of the island's problems have 114
become so deeply entrenched as to be intractable. They have been
the *raison d'être* of so many commissions and committees of in-
quiry that their existence is now almost forgotten by the islander
—if indeed he ever understood their nature. Some results have [611]
been seen, such as the Crofters Act of 1886 which gave High- [175]*
land crofters security of tenure, perhaps the most valuable [427]
measure of the last century or two. But somehow all things have
not progressed so well since that date; at any rate not so fast that
crofting, for instance, is now seen to be an economic form of
land use of benefit to both local community and nation at large.
Many problems have been virtually ignored by successive central 657
Governments; at least, remoteness seems to qualify a topic for
the office 'pending' tray. It has yet to be fully realised that the
island, with other Highland communities, is part and parcel of
the area generally administered from London and Edinburgh,
and merits as much attention to its welfare as other European
governments, such as Norway, give to their remote mainland and
island communities.

As usual, charity and self-help begin at home, and one of the 178
most dramatic changes in island life has been the result of the [241]
agricultural revolution of recent years which is changing once
brown moors to lush green pastures: reclamation by re-seeding.
This revolution is still going on. Lewis crofters in particular are
showing the way, with other Highland crofting areas following
suit. The change in the Lewis scene is being emphasised by the [245]
planting of shelter-belts of hardy trees and the first of the new [313] •
plantations of timber-producing trees. These show the promise of
the future: a lively future for a lively community. The fishing in- [228]
dustry also has a future, brighter on the horizon than it has been
for many a poor year. The Harris Tweed industry, the staple em- [288]
ployment-source in Lewis, is maintaining its ability to retain the
interest of the market. And tourism, once a perfunctory and [484]
casual affair, promises to emerge as a useful sector in the
economy. There are, in addition, many small pockets of native
initiative and enterprise which, given sufficient encouragement

CH. III THE ISLAND HOME

342 maintained—once an important aid to the survival of half-
343 starved cattle. A slope from the dwelling-quarters down
to the byre facilitates drainage: normally the length of the
[178] homestead follows the slope. The separation of house
from byre took place in Harris and Uist over seventy years
ago by County Council decision, but in most of Lewis,
even in 1947, about 40 per cent of the homesteads were
342 of the primitive type, outwardly but little changed. This
separate cottage, as in Harris, is a shapely little structure,
roughly symmetrical and particularly pleasing when the
walls are whitewashed below the pale-gold thatch.

342 The surviving 'black house' is a stone structure. As
343 Stevens has written, "the rock of the island is hard to
[314] work, and hard to win", and may be covered by peat.
[324] Undressed stones are collected and sometimes carried for
long distances. Before dynamite came into use, a very
large stone could be broken up by lighting a peat fire on
it, then dashing cold water over it. By an old Gaelic
custom, the bachelors of a township used to help to build
the house for one of their friends who was about to marry.
[333] Lime for mortar being absent from the island, the walls
are built dry. The wall is double, the space between
being filled with earth. Hence it may be six feet thick
[354] at the base, though barely six feet high. Typical primitive
houses lacked windows, only a little light entering through
the smoke vent and through a piece of oiled skin, replaced
latterly by a pane of glass let into the thatch of the roof
or by a deep window aperture in the wall.

342 Roof building is a difficult problem in construction,
on account of the scarcity of timber and the strength of
343 the winds, and explains the narrow plan. Wood was so
• 313 scarce that when a house was abandoned the frame of the
[182] roof was removed, the spars being the tenant's; but in
[422]
[178]

[TEXT CONTINUED ON PAGE 82]

ISLAND, WORK AND PEOPLE PT. 1

342 later times the landlord might supply timber. Long
343 ago a main source of timber was the shore. The length
• [313] of the house may be fifty to sixty feet, and the inside
[422] breadth ten to twelve feet, spanned by ten or a dozen
[178] pairs of couples on which are laid transverse 'cabers',
which may be tree trunks, branches, odd wood, old oars,
or, exceptionally, sawn timber. The tops of the walls are
353 finished with turf, to keep the filling from being washed
out, and to provide a smooth bearing for the couples, the
ends of which are pushed into the turf so as to bear on
the inner half of the wall; the rounded form and absence
of overhanging eaves prevent a gale obtaining purchase
on the roof, but a gable with chimney is now usual on the
356 end wall of the inner room. The rafters are annually
covered with turf, and the roof is thatched with thin, short
barley straw, which was pulled up, not cut, after the ears
were picked off, the roots gripping well, and the stem
hanging outward and down.

353 The door gives direct access to the byre (*bathach*),
through which one reaches the middle part, or living-room,
'at the fire' (*aig an teine*), from which there opens the
inmost part, the 'room' with bed-closets. There is no
ceiling to the primitive house, the row of box beds having
tops to keep off the drips of rain water. In the middle of
the earthen, sanded floor of the living-room is the circular
hearth, built of stones with clay between, and raised a few
inches, with no chimney.

343 In the byre, the manure accumulates from spring to
spring, and a breach is made in the end of the house for
the annual removal of the manure. There are no privies.
Where there is fodder and straw in any quantity a barn
342 is added. Stacks are rare because of wind. A low wall,
343 continuous with the house and barn, may enclose the kale-

ISLAND, WORK AND PEOPLE PT. 1

2. From Black House to White House

342 Discontent with the old black house grew with the
177 knowledge and experience of better housing in Stornoway
178 and on the mainland. The congestion which developed
during the nineteenth century meant that often one house
175 was fouled by another above it, leading to typhoid epi-
342 demics. While the smoky atmosphere of the 'black
161 houses' inflamed the eyes and irritated the respiratory
164 system, the roof was high and the fire kept the air in
motion by day, ventilating it to the chimney hole, while
the lack of glass often made it necessary to work with the
[354] door open. The ravages of tuberculosis came towards the
end of the nineteenth century, when Islanders went to our
crowded towns and, not being immunised, were danger-
ously infected. Returning home, too often to linger and
die in a house now provided with tiny, fixed panes which
permitted a closed door and made it stuffier than before,
178 patients spread infection. Flight to a tiny, air-tight
342 wooden cabin or to a small white house of stone and lime
often followed. The availability for the first time of planks
• [313] and timber, a certain practice in boat-repairing, and pos-
[177] sibly acquaintance at first- or second-hand with Canadian
wooden houses, may have influenced the choice of wood.
The early 'white' houses, with an attic lit by skylight,
were airtight, for the windows were too often fixed or only
[354] opened at the bottom. The door was left open in warm
weather, but it was not high enough to allow the escape
of the stale, upper layer of air which the women breathed
as they did their cooking and baking.

342 In the inter-war period, particularly in its last decade,
746 the 'black house' was being abandoned, not for something
198 worse, but far better. The Government-aided houses have
656

[Kershader]

(b) From New Year to mid-April most sheep are kept on the common grazing. Practices, however, are irregular: some flocks are usually hand fed, others only rarely. In the former case they shift near the upper limit of their home croft and remain fairly close at hand. Most crofters hand-feed their lambs, probably housing them at night, allowing them hay in the morning and turning them out to the common grazing in the evening. All this naturally depends on weather conditions.

(c) From mid-April to May, lambing takes place on home parks.

Most crofters let their ewes-with-lamb out at one date.

(d) At the end of June, gimmers and wedders are clipped.

(e) In mid-July the ewes are clipped.

(f) The lambs are weaned in the first and second weeks of August.

(g) The dipping takes place in October and the rams are brought on the crofts.

There is no general sale time, sheep being sold or slaughtered at all seasons. There is no club stock, but all but one of the Kershader crofters, along with crofters from neighbouring townships, take full advantage of the arrangement, first established in 1941, to graze sheep at 2/- per sheep and 1/- per lamb in Park Deer Forest. Hence irregularities of rhythm are introduced or exaggerated.

Sheep are not particularly profitable: in general, wedder fleeces give 3½ to 4 lb, ewe fleeces about 3 lb, and the wool is sold to the Stornoway mills and to the Wool Marketing Board. Average sheep carcass weight is reckoned to be 41 lb. and the price rarely rises above £3 and almost never above £4. Braxy and fluke are kept under by medicaments but remain potential dangers; 'Black leg' is still a serious problem. Many sheep are drowned in the bogs in Spring and late snows (1955, 1958) are disastrous for lambing.

Under-employment is a serious problem in Kershader. There are nine males classified as full-time crofters, but probably only four of these (two on one croft) are in fact in this category, and of the total of thirty males with their homes in Kershader, only fifteen of the insatiable population are permanently resident. There are twenty-eight females with their homes in this township, but on only six crofts do any of twenty permanently resident females help with croft work. Local ancillary employment consists of weaving, fishing (for domestic consumption only), and work on the roads. Boats, one with outboard motor, are owned by three crofts. The only resident professional worker is a nurse. Ancillary employment must be, and is, sought away from the township. As a result, of the 73 persons recorded as having migrated since 1939 or as being resident, periodically away and permanently away in 1958, 19 have left the area for good, 4 are permanently away, 8 periodically away, and only 43 are resident. Only one person has entered the township since 1939. The age structure of the population, too, is far from the optimum. The school in Kershader, which had 28 pupils in 1871, reached a peak of 110 in 1907 and declined to 28 pupils in 1953, now has but 17, although it serves Caverate, Garyvard, Kershader and Habost. Maximum population was attained in 1881, but the total remained fairly constant till 1911, after which decline was marked. Since 1955 this decline has markedly increased.

It will thus be seen that the most serious problem facing Kershader is that of stabilising the population and giving it a stronger economic basis. Apart from the potential development of tourism, fishing, weaving and other home industries, the only possible occupation is in agriculture with perhaps a little forestry. Forestry, though important as shelter provision, cannot be a practical propositim in large blocks or on a large scale, as it would dislocate the

[Kershader] [Garyvard]

common grazings - at present approximately correctly stocked - and cannot therefore provide much employment. Hence it is the standard of agriculture that must be improved. Since the land does not permit striking extension or improvement of the cultivated area, development must be directed towards improving pasture, with more re-seeding and controlled grazing similar to that already described. All this, however, is of little avail if prices for cattle, sheep and wool remain low, or at least lower than prices prevailing on the mainland. The first priority, therefore, is the establishment of a prosperous agriculture is a guaranteed market-price. Given this, it might become worthwhile to take steps to increase the carrying capacity of the crofts. It may be assumed that this would involve an all-round improvement which could give a firm basis to the economic existence of the community; until this is achieved, stability and continuity are out of the question.

GARYVARD

Gwenyth R. Page, B. A.

The landscape of the south-east coast of Loch Erisort is a sombre and rugged one. The Quaternary ice sheets left in their wake troughs now filled by the sea loch, innumerable lochs covered in water lilies, a massive area of indeterminate drainage and expanses of bare gneiss.

Garyvard is set on the fringe of this landscape on a 20 to 25° slope with the crofts aligned from the moor to the sea, on a mantle of drift. Here is the home of the MacLeods, the MacKinnons and he Montgomerys. Life beats out its regular pattern of existence during the winter months on the croft, followed by an increasing tempo and variety of work during the rest of the year. In January and February the animals must be fed on hay or lose the battle to survive. In February there are preparations for the year's tasks, making repairs and improvements to the croft. Next month will find the crofter on the land, making or clearing drains and putting fences and dykes in order. The tempo of life quickens with the year; April sees the first sheep dipping, the land turned over, potatoes and oats sown. From mid-May, the sheep leave the crofts to fend for themselves on the common grazing. The following three or four months are times of tremendous activity on the moors when the peats are cut, to be stacked later, first in fours, then in eights, so that the wind may dry them, till eventually bee-hive-shaped stacks - sometimes as high - can be seen near the peat banks in August. Then begins the wearisome task of carrying the peats home, all too frequently in creels carried on the back, since the peat workings of Garyvard are on the moors up to half a mile from road. Altogether some two miles of roads are needed to peat on their crofts, whilst others have permission to cut from Cromore or Caverate common grazings close to the road. All the while croft work continues, varying from hoeing, weeding and cutting hay to the gathering of sheep for shearing. As there are no fences between the various commons, crofters must travel from one township tank to another, seeking their own. In August the lambs are weaned. Hay making generally ends in August and is immediately followed by the oat harvest in September. By the time both oats and hay have been gathered in, the potatoes are lifted and the sheep are brought in from the common grazing about October 12th. The last sheep dipping takes place in November and is followed by tupping.

There are eleven crofts altogether, though one is divided, each portion having a legal tenant who has a half share in the common grazing. Two crofts are 12 acres in extent, the half crofts 2.75 acres only, though the acre cultivated on the common grazing by one of the latter crofters since 1923, has recently been officially recognised. Most crofts are in strips running from the sea-shore up the slope some 500 yards to the township dyke, and are clearly demarcated by fences erected just after the last war. Three crofts have additional strips whilst one croft was an extra strip belonging to another croft. The additional strips date back about 100 years to a time when the township grew rapidly as a result of evictions in southern Park. One croft is divided and worked in three separate parts so in effect there are fourteen operative units in Garyvard.

As far as the crofting population is concerned, the benefits are rather negligible. In fact some of the crofters of Carbost township find the presence of the distillery to be a distinct disadvantage because they must keep their "fank" in an inaccessible location well off the drainage slopes which serve the plant. I should add one additional fact. Like all the major commercial ventures on the Island, the distillery is owned by a corporation with offices in Edinburgh.

Forestry. In recent years forestry has come to enjoy widespread popularity among critics of the "Highland Problem" as a remedy for the distress, lack of gainful employment, and depopulation of the area. Within the last decade or so forestry has become a source of employment for a small number of men on Skye. The Forestry Commission acquired 9000 acres of land between Glen Brittle and Loch Eynort. Houses were built for employees and nine new families were brought in. Planting has been carried on at a rate which gives regular employment to 12 men, one man to each 120 plantable acres. As the labor required for planting decreases, the men are being shifted to thinning operations. Ultimately, they will begin lumbering. It is anticipated that in time there will be jobs for sixty or more. For every 100 acres there will be one man engaged in planting, thinning, or lumbering and five men or women working in auxiliary employment, such as transportation, mill operations, and services to the anticipated village. The government has been impressed by the success of its experiment. Another large tract, a former sheep farm,

just outside of Portree was taken over in 1953, and there are plans for acquiring additional blocks of land.

One reason for the optimism surrounding the potential benefits of forestry to the Highlands is the growth of population which it apparently stimulates. In Glen Brittle the local school, closed for many years, has been reopened. But, as in all migration schemes, the average age tends to be low, and, consequently, procreation is to be expected. Whether or not the potential benefits will be realized remains to be seen. Decidedly in favor of forestry is the stable employment which is offered. Further, a man can be allowed time to carry on crofting not only in his spare time but also full-time when seasonal demands require his full attention. Whether or not there will be enough land left for pastoral-agriculture, near the plantations if he wants to take the time, is another question. Then, too, there are natural limitations to the extension of forests.

The difficulties to be faced by forestry on Skye may be briefly summarized. Above all, conditions for tree growth are far from ideal over much of the island. If the soil is fertile enough for trees, as in Glendale and Kilmuir, exposure to the south and west winds may be too severe for a plantation. Shelter belts might be planted, but they have no commercial value and offer only fleeting employment. If there is shelter from the wind, as in Sleat, the soil is either too poor or too boggy for commercial operations. Beyond the areas already acquired and the few small plantations on private estates, the land considered plantable is in limited, isolated patches. At this

point cultural considerations enter. The land is often essential to the continued existence of the farm or the crofting township. In Sleat, for example, the land which the Forestry Commission has listed as commercially valuable is the lower, sheltered grazings of several farms and crofting townships. Finally, there is the people's dislike of trees. Many a Sgiathanach in Portree is distressed by the plans to cover Glen Sligichan with a forest. They share the attitude of a man from Soay, a small island a short distance off the west coast of Skye, near Glen Brittle, who was being moved to the Isle of Mull by the Department of Agriculture when Soay was evacuated at the crofters' request. "Och, its all right down there, but you can't see the sky unless you bend over like this," he said bending over double and looking over his shoulder.

We have now accounted for, at the most, 120 men and 20 women who work for wages and 238 crofter-fishermen. Excluding the latter, there are over 1000 men and almost 500 women who are employed locally at sometime during the year.[32] With only a few remaining isolated industries, such as the small silica sand quarry at Ord in Sleat and the infrequently used limestone and marble deposits at Broadford in Strath, most of the opportunities for employment have to be in services for women and laboring for men.

Let us consider the occupations of women. Over half are employed as resident domestic servants or as help in hotels and restaurants. Ten percent find work in the local shops as clerks.

[32] Information extracted from the files of the Ministry of Labor in Scotland, Portree and Edinburgh.

Types of ancillary employment

The question of the desirability of ancillary employment in a crofting district is often debated. On the one hand, engaging in such work means less time for croft work and makes wholehearted participation in the agricultural life of the township a virtual impossibility. On the other hand, crofters who take ancillary employment are better able to make capital investment in their croft. Table IV shows that in Park, croft efficiency, as expressed by the souming to actual stock ratio, is not necessarily related to participation in ancillary employment. If the township is to be re-established as a working entity, a clearer dichotomy in the population seems desirable; those who wish to work the croft on a full-time basis might be given full use of the available land, and those who wish to earn their living in non-crofting employment could take out feu charters for their houses. It is clear that the agricultural resources of Park are insufficient to maintain the present number of crofts as viable economic units but the problem of finding industrial employment for any large non-crofting population is very great.

The Park Association, in their keen search to attract industry, met with little response for high freight rates and distance from markets made economic industrial costing well-nigh impossible. The Chairman of the Crofters' Commission has recently suggested that some of the Glasgow Overspill of "tradesmen and small businesses" might find "an opportunity to prosper in the West Highlands and Islands"[1] but even with Government grants for the establishment of small factories, it is clear that present freight charges would be a severe deterrent.

One possibility is that the fishing industry might be revived. In 1945, 16 large motor vessels were fishing from the townships between Cromore and Gravir; by 1952, three boats remained;[2] only one boat was still fishing in 1958. The recent Fishing Board Scheme guarantee, which provides a flat weekly rate for every boat turning out, brings hope as this guarantees a minimum livelihood. The major problem is the finding of the initial capital required to buy and fit out a modern boat, at present about £20,000. Eighty-five per cent of this sum can already be found in the form of grants and loans from the Herring Industry Board but the remaining fifteen per cent or £3,000 is often the more difficult sum to raise. The Murdo Macaulay (Rhodesia) Trust has offered assistance to a limited number of fishermen towards the raising of the £3,000[3], and this offer is a real opportunity. If fishing is not re-started soon in Park, few of the original fishermen will remain to instruct the new generation.

Tourism is an industry hardly developed at all in Park. Lack of running water has made the householders shy to offer accommodation, but it should be remembered that there are city dwellers who are delighted to accept inexpensive accommodation away from the crowded resorts. Dr. Stig Jaatinen, in his "Human Geography of the Outer Hebrides"[4], states that this fact has made the Aaland Islands prosperous, and believes that tourism on simple lines could be successfully developed in the Outer Hebrides. Tourism need not bring in its train the desecration of the Sabbath for people who are willing to journey far in search of a quiet holiday usually conform to local observances.

Unless new sources of employment are brought to Park, it is clear that ancillary employment must continue to be sought elsewhere. The higher 'spending standard' in industrial employment, and the opportunities to find entertainment in urban areas (tastes often resulting from experience during school days in Stornoway or National Service), militate against a large population of young people, but basically lack of employment and the uneconomic nature of the crofts are the real reasons for the high degree of temporary and permanent employment away from Park.

1 Letter to the Glasgow Herald 27.1.59
2 South Lochs Survey Report.
3 Stornoway Gazette 27.1.59
4 Stig Jaatinen, Acta Geographica XVI, No. 2. 1957.

312 There is no piped water supply and after even a short period of dry weather there is a
[601] water shortage. One prosperous crofter (where the crofter does weaving and one member of the family is periodically away with a Norwegian whaling fleet) bought a large modern Bendix electric washer only to find that there was not sufficient water to use it except on
[354] rare occasions. The croft houses have had electricity since 1954, and even the three remaining inhabited thatched houses now have electricity.

311 Although there are only 4 full-time crofters, most of the crofts are carefully and well worked. Only a few crofts are decaying, and there is a tendency for these to be sub-let to the more agriculturally inclined crofters instead of allowing the land to revert. In
[288] addition to the full-time crofters, 31 other men do part-time crofting. Eighteen men weave and this provides their main income, but this figure fluctuates according to the prosperity of the Harris Tweed industry; at present the figure is probably higher than
[166] average. Although 32 people have emigrated from the township since 1939 (many of them
[161] young people who have married on the mainland), there are still several young people and
[162] young families making their homes here. The dominant age-group of permanently resident adults is 15 to 44. Total population is steadily declining, but Callanish has always been a prosperous area and seems likely to remain among the more prosperous crofting communities.

BREASCLETE PARK by Margaret Grice and Doreen J. Phillips.

195 Breasclete Park, also known as New Park, Callanish, was settled by people cleared
427 from Reef in the mid 19th century. Two of the six original crofts have been subdivided, making nine. However, there are only five working units and on one there is no cultivation. There is also a feu house built in 1958.

361 The crofts, which are fenced, form broad strips perpendicular to the Breasclete-
241 Callanish road. Cultivation is mainly by tractor, oats, potatoes and some clover being grown. One progressive crofter has successfully experimented with re-seeding one
231 acre of grazing land on his own croft. Common pasture for the 148 sheep and 6 cattle is shared with Callanish, and for most purposes the Park can be considered a part of that township.

162 The total population is 26 of which 4 are permanently away. There are 6 people over 65, and 8 children under 15.

BREASCLETE by Margaret Grice and Doreen J. Phillips.

131 Breasclete is situated on the east side of East Loch Roag on land which rises gently
133 from the seashore to the moorland and is interrupted by rocky outcrops of gneiss in the northern part. It is separated from the township of Callanish to the south, by a small westerly flowing stream, at the mouth of which is the site of a mill.

491 The road on which most of the houses are situated, follows a curve through the
361 middle of the crofts, but newer houses and some feus have been built along the main Callanish-Cartoway road, nearer to the shore. Stornoway is 18 miles away along this road which is turned throughout. Breasclete could be served by the still unfinished Pentland Road, were it to be properly surfaced and this would make the journey shorter
[491] by 4 miles. Two buses in each direction per day connect the township to Stornoway, but high fares make visits to the town infrequent.

312 The township hopes to receive the mains water supply within the next few years, but, at the moment, relies on wells within easy access of most of the houses. Many houses have piped water from private wells, some of which go dry after two or three days good weather although the wells on the lower ground never fail.

[Cromore] [Marivig]

366 butchers' vans call on Wednesday and Friday and a fish van once or twice during the week. Goods
494 are also conveyed by the daily bus. Electricity was brought to the village about four years ago
377 and the inhabitants now look forward to a supply of piped water in about two years' time. At present
312 only three or four houses have bathrooms.

The crofts, when worked well, are good enough to provide the existing population with a satis-
241 factory subsistence, but each family unit must have some additional source of income. It seems
436 that the recent subsidies for fishing are good enough to attract fishermen from Cromore and one or
228 two boats might be sent out from the bay if the quay were longer. Weaving has brought prosperity
288 but, as the Park Association states in its Second Progress Report "there is not sufficient weaving available for the present number of weavers". The proposal to establish a spinning and processing plant in the Park District made in the 1957 Report, would undoubtedly be of great value to the
000 people of Cromore. The village is sited in a most picturesque spot and one of the inhabitants suggested that a hotel built on Crobeg Farm would bring some benefit to the community. However, even if these three increased sources of income became effective, one wonders whether they would be sufficient to attract the younger generation, already urbanised by schooldays spent in Stornoway.

MARIVIG

Pamela Gough, B. A.

131 Marivig is situated on the western and south-eastern sides of Loch Marivig, a small triangular sea loch opening to the north-east and sheltered from storms and swells by Torray Island, making the loch an ideal anchorage and harbour.

133 The land rises steeply from the shore of the loch for twenty-five feet to fifty feet, then slopes more gradually and irregularly, with frequent precipitous rock outcrops, for two hundred to five hundred yards to rise steeply to a line of low hills, two hundred and fifty feet to three hundred feet high, surrounding the loch. All crofts thus have an easterly or north-easterly aspect, not particularly favourable for agriculture, and only one has any appreciable area of level land
134 uninterrupted by rock outcrops. Soils, derived from glacial drift, are unevenly distributed, thin, and very stony, and cultivable areas are thus small and widely dispersed.

137 The surrounding hills, which form part of the eight hundred and sixty-three acres of common grazing, are mainly covered with heather, moor grass or sphagnum bog, while the lower areas within the township are grassy, but drainage is poor, and rushes are widespread. Bracken is not yet a problem, and only small areas exist, mainly on the lower slopes of the western side of the loch. A few rowans and willows survive here also, but otherwise the area is devoid of cover.

There are twenty-four registered crofts in Marivig, twenty-two being inhabited, one vacant
241 and worked by another crofter, and one worked from a house on the common. With the exception
632 of two crofts, one of which is on the common, all the boundaries run from the township dyke, which closely follows the two hundred foot contour, to the sea in radial fashion (Fig. 4). The size of the crofts varies from 1.25 acres to 22.25 acres but only seven crofts and less than four or more than eight acres in size. No croft has more than three acres of land which has ever been cultivated, and few now cultivate more than one acre. There are thirteen cottars and squatters, five houses being on the common, three of them cultivating small areas adjacent to their houses.

241 Cultivation is exclusively by spade on the 'lazy-bed' system. Owing to the rocky nature of the
244 terrain, the 'lazy-beds' are narrow, often only one or two yards wide. Potatoes and oats are
246 grown in rotation, and hay taken from lazy beds left fallow. Very few crofters sow grass for hay
237 or undersow their crops. Dung and seaweed are used as fertilisers, with potato fertiliser as the
324 most general 'artificial'. Small enclosed gardens, often somewhat neglected, produce lettuce, carrots, cabbage and soft fruits on about half the crofts, but no garden produce is marketed.

[Marivig]

231 There are only fifteen cows, two yearlings and four calves in the township, and the crofters with no cow rely on neighbours, or on tins, for their milk supply. All but two of the crofters keep sheep, there being four hundred and eleven ewes, one hundred and eighty-five sheep and two hundred and thirty-four lambs belonging to the township. The common grazing (including the off-shore islands which are grazed by five different crofters each year) is used for the sheep in summer, while
235 all but one of the crofters winter their sheep within the township dyke on the crofts. Most crofters keep hens, and surplus eggs are sold to the Stornoway vans.

314 Peats cut on the common are transported by lorry to the crofts, while peats from the north end of
482 the peninsula separating Loch Marivig from the sea must be carried in creels.

Nearly every crofter owns a rowing dinghy which is moored in the loch off the end of his croft,
228 and with this supplements the family food supply. One herring boat, operating nightly from Stornoway
501 and returning to Marivig at weekends, is all that is left of a fairly large fleet which operated before the war. A second boat, unused for two years, lies shored up on the beach, and two others are wrecks. Over fifty years ago there was a curing station at Marivig. One crofter fishes lobsters during the winter and markets them in London.

363 Of the other crofters, only two supplement their incomes by weaving, one by working on the
366 roads while several men work partly on the crofts but are periodically away whaling in South Georgia,
fishing, or on hydro-electric schemes. Several others are in the Merchant Navy. The gradual
166 migration from Marivig, especially of the young people, is reflected in the high average age of the
167 permanent residents, and in the numbers in the school - over one hundred pupils in 1900, thirty-nine
162 (including sixteen from Calbost) in 1946, but only nine (none from Calbost) in 1958. The young
171 people leave the township to train or work on the mainland (generally in Glasgow) or in Stornoway, while their elders accept the view that "there is nothing for the young people here".

205 The township has a Post Office and telephone kiosk which also serve Calbost, while lack of a
206 shop is partially compensated by a choice of four vans from Stornoway and one from Gravir. There
366 is a daily bus from Gravir via Marivig to Stornoway and back: the return is over 10/-. The road
494 which reached the township from the west in the late 1920's has a tarred surface and is much
438 better than the later road southwards to Gravir which is untarred. There is no church in Marivig
491 and most of the population attend the Free Church in Gravir.
466

Within the township the two arms of the township road serve all but two of the crofts and the
363 sites of the newer houses, few of them more than thirty years old, tend to be near the road, while
361 the ruined houses found on most crofts are often nearer the sea. Only two thatched houses remain
342 and the other inhabited houses are built of stone roofed with asbestos slate, or of corrugated iron.
377 All the crofts are supplied with electricity from the grid, but very few have a piped water supply;
312 rainwater is collected from the roofs and piped for washing, with a separate piped supply from a well for drinking. All other houses draw water from wells.

829 The stormy winter weather, rocky terrain and poor soil are all blamed by the residents for the drift of population away from the crofts, but those who remain have little incentive to work the
000 crofts more efficiently owing to the very hard labour involved. It is suggested that with more intensive cropping and more cattle, each croft could make a comfortable profit and surplus milk, potatoes and eggs could be marketed in Stornoway - the milk replacing that at present brought from the mainland. Such development, perhaps on a co-operative basis, together with a revival of the fishing industry and introduction of a tourist industry, by building a small hotel or guest house and attracting anglers as well as those who simply wanted scenic beauty, might bring prosperity back to a township which otherwise may well be derelict in the next twenty years. But the capital required for the two latter enterprises is not available within the township.

[Lemreway] [Orinsay]

229 The West Highland Survey Township Card[1] describes Lemreway as "predominantly a fishing
176 township". The remains of an old curing station are visible today and until 1947 there were twelve
436 boats operating from Lemreway. A declining market, increasing cost of gear for obsolescent boats
and the lack of a landing stage led to the decline of the industry in this township. Today there is
435 one fishing boat which lands its catch in Stornoway: working with modern equipment, drift and ring
504 nets, it provides a regular income for a crew of six.

An examination of the population statistics proves interesting, especially when compared with
161 those for Orinsay. Lemreway's resident population of just over 70 males and 70 females is large
162 considering that there are six unoccupied crofts. Eleven of the crofts have more than one house and the cottar population forms over a third of the total residents. More than two-thirds of this resident population is in the two important age groups - between 15 and 64. With over forty resident males in the working age group, Lemreway provides a striking contrast to other crofting townships in Park.

463 Fourteen of these men are full-time croft workers, while nine others find work in ancillary
241 occupations such as weaving and fishing. A further eight supplement their croft work with regular
288 employment - a postmaster and a postman, a bus driver, a lorry driver and several weavers. Just
228 over thirty people work away from the township permanently, fourteen in the Merchant Navy and
205 nine girls in domestic service, while a further nine engage in seasonal work.
494

Emigration from the township has continued steadily with forty people leaving since 1939.
166 Nevertheless, Lemreway has a larger proportionate resident population than most townships.
167
505
357

Only four thatched houses are occupied and housing conditions generally are good. Every house
342 has electricity, but, with four exceptions, water has to be carried from springs and wells. Most
377 of the present houses were constructed in the 1930s and they are usually near to the road. Ruins
312 of the old houses remain, some being used as byres, and these were built either along the shore or
961 up the slope in the shelter of the hills, where the house was near the sheep, the peat and the spring
917 Today supplies of food, peat and even seaweed are brought by road.

Mention must be made of the possibilities of the tourist trade in Lemreway with its most
484 attractive situation and reasonable road connections. An approach has been made to the Scottish Youth Hostels Association and while hostellers could not greatly increase the income of the residen they would stimulate interest in the area. Accommodation for summer visitors, other than relativ
485 of the crofters, is difficult to find but it seems that at least three houses could be used.

000 It is possible to be optimistic about the future of Lemreway, as at the moment considerable
407 enterprise is being shown. A Ferguson tractor, bought this year by a man returning from whaling is an example. It is to be hired out and could be put to good use in some parts, especially on the
311 outend. The attempt to improve the common pasture and the new extensions to neatly painted hous
242 all reflect a combined effort to improve conditions. The old economy of crofter-fisherman is being adapted to modern times and crofter-weaver, crofter-postman and crofter-bus driver are th
463 contemporary employment combinations.

The pessimism and apathy noticed in many crofters is to be found in Lemreway but above this
181 is the impression of enterprise. If Lemreway can continue to adapt itself to changing conditions,
000 it may be able to combat the 'drift to Glasgow' and continue as a successful community.

ORINSAY

Beth Blowers, Brenda Turner and John Wearmouth

131 Orinsay is a small crofting township clustered, in the form of a horseshoe, around the head of
361 a sheltered bay on the northern side of Loch Shell. Most of the houses are situated within fifty ya
241 of the shore on a narrow strip of level land, while the crofts extend from the shore on to the moor

1. The Directors of the Crofting Survey are grateful to Dr. F. Fraser Darling for granting acce to the individual Township Cards, which are a storehouse of information. For detailed con-
113 tents of the cards, see West Highland Survey p. 247.

5:	Caird et al.	K-S	(1958)	1959	ES10 Highland Scots Park ES10

231 Recent trends also point to a decline in the numbers of sheep, although more are kept now than
[288] fifteen years ago. From 1942-51 the numbers were more than doubled (263-565). A great deal of this increase must have been a result of the ewe subsidy, but part at least may be connected with the war and post-war boom in Harris tweed. By 1955, when the subsidy was suspended, numbers had already begun to decline and have since fallen steadily. This year the township has only 374 breeding ewes while the rearing of only 236 lambs would suggest a further decrease in the future.

221 All the crofters keep some sheep although individual stocks vary from 15 to 150. For most of
233 the year these sheep are grazed on the common pasture on the moor or on the eighteen acre island in the bay. In August, however, the lambs are gathered in for weaning and dipping; in November the gates are opened and all the sheep allowed to graze on the cleaner pasture within the croft boundaries. If necessary they are given fodder, but from the beginning of January they are encouraged to return to the moor, although the gates are not 'officially' closed until May.

311 The total area of the common pasture exceeds 1500 acres, but most of this consists of hummocky,
233 waterlogged peat moorland supporting only poor quality coarse grasses and sedges. Over 700 sheep now graze this area and the apparently large common pasture is in reality drastically overstocked, a process which must inevitably harm the animals as well as the land.

231 No pigs or horses are to be found in the township and each crofter keeps very few hens, normally
235 just sufficient to provide eggs for home consumption. Any surplus eggs which do remain are sold
[435] to the Co-operative van, but prices are so low that the keeping of more than a dozen hens is far from profitable.

434 It can be appreciated that crofts of this size and quality can neither provide the crofter and his
464 family with sufficient income, nor fully occupy the available labour force. As a result, people
228 in the past have turned to the sea. Indeed the West Highland Survey describes Orinsay as "primarily a fishing township". Today the herring fishing has disappeared entirely and only one crofter still does a little lobster fishing, sending his catch direct to Billingsgate.

161 There are now 45 people resident in Orinsay but an examination of their ages reveals that less
162 than half of them are between 15 and 64 years. Indeed there are only six resident males between these ages, and three of these spend at least part of their time working away from the township on the Eishken estate.

366 As there is neither a school, post office, shop nor garage in Orinsay, there is no available
368 occupation in the 'service trades'. Therefore, over half of the males between the ages of 15 and 44
166 are permanently away in the Merchant Navy, returning home only for holidays, while another third
167 are seasonally away with the whalers. Similarly almost half of the females of similar age work in
464 domestic service in Glasgow. It must be realized that most of these people working away assist
505 their families at home, and that a large part of the croft incomes are made up of money sent home,
228 together with pensions and other allowances. Emigration from Orinsay to other areas has continued
462 steadily, twenty people leaving the township since the war.
357
454

On the whole, housing conditions are good, due to relatively recent construction. There is
395 only one traditional black-house, and even this house has electricity: only one house is without it.
372 Water supply is not so certain as wells and springs are the only source. The township lacks a
206 telephone and a shop, but is served by travelling vans. A good road, constructed within the last
366 decade, connects Orinsay with Gravir; entering the township via the valley to the north-east, it
431 serves directly all but three of the crofts. A bus leaves daily for Stornoway, about thirty miles
494 distant.

161 Like so many other crofting townships Orinsay, above all else, gives an impression of con-
162 gestion. The self-same hills that provide shelter also restrict cultivation. The crux of the situation is that land, extremely marginal in character, is being worked by too many tenants on holdings too small to be economic. With three residents to every two acres of cultivated land, Orinsay must be seen as an 'overspill' - an unfortunate result of the cottar problem in the 'twenties'.

/p. 35/

depend upon the women of Skye. 000

The Spare-time Crofter. Under this type we must include not 231
only the able-bodied, married man who tends to become a full- 241
time wage earner, but also the old, pensioned, married and 887
unmarried men and women who are no longer able to perform the necessary chores. For the latter, whether they have a small or medium-sized croft, the croft becomes a means of living within a pension rather than a potential source of livelihood. For the former, the croft becomes a means of living cheaply.

When the crofter goes out to work, he either tends to 231
neglect the croft or expects his wife to manage it. Oc- 241
casionally, the husband will help with the ploughing or the 593
harvest in the evening, but he never lends his wife a helping 462
hand in her domestic duties. The only men on the island that I knew who helped their wives with the dishes or the care of the children, except disciplinary measures, were a minister from the Outer Isles and several Lowlanders in Portree. Since [312] very few crofters have plumbing, the wife must fetch water from a well and dispose of waste in the nearest stream. If there is to be a supply of peats, she must cut them. If there are cattle and sheep, she looks after them. Lambing may be left to the township shepherd if the crofters can afford one, and shearing is usually left to the men of the township. An exceptional spinster or widow may shear, but it is indeed an unusual married woman who will break with the traditional

[Habost]

134 Drift is found near the shore and laps round the three hills nearly up to the road, predominantly heavy clay with small boulders; this is replaced above the road by peaty loam on rock. At one time, here was grown on the heavy drift. There is peat accumulation on the flat land near the road to a depth of about six feet and there are one or two peat banks.
137 Vegetation is poor; there is no bracken or cover and within the crofts, moorland grasses and sedges predominate on rough land, though there are many lazy-beds sown down to clover and cocks foot. On the hills heather predominates.

175 Habost is the oldest township in Park. In 1843 Maclennan came from Shieldernish and
692 took what are now Nos. 9, 10, 11, 12 and 13 and Ailean Tailear came from Taransay, Harris,
621 to No. 7. By 1886 there were thirteen crofts; in 1907 four cottars were recorded, three being there before 1886; in 1957, No. 11 which had been shared between two brothers since 1906, became legally 11A and 11B making fourteen crofts. There are also fourteen operative units although two are worked from Kershader, both as 'hay and grazing' units, and two are worked as one unit within the township, for there are three non-crofting units.

241 Only sixteen lazy-beds are dug by spade, the rest have been drained with stone drains and
409 ploughed by tractor owned by one crofter who loans it out to Habost and Kershader. There are three 'Croftmasters' (hand-tractors) in the township but these are only heavy enough for
233 bringing in peats, hay and similar light work. The progressive Habost community has fenced off part of the common grazing, to keep the weaned lambs off the croft from August till November and so save fodder for winter when the croft land is open to grazing.

[244] Oats and potatoes alternate in the rotation, with a little sown grass for hay, sown in enclosed
[246] parks of about one acre. The tendency now is to increase the number of parks, cut the hay in
[231] June and build up the lambs on the new grass. Shell-sand is used to fertilise the parks but
[824] elsewhere artificials, such as superphosphates, 'potato manure', potash, nitro-chalk and lime are used in addition to dung and, near the shore, seaweed. Most of the hay is taken from old lazy-beds.

231 The land is heavily overstocked: the soum is equivalent to 79 cow units, and actual stock is
233 144, whilst the figures for sheep are 191 and 618 respectively, including the sheep stocked in
[432] Park Deer Forest by seven of the Habost tenants. Sales of cattle are held at Garyvard in November
[221] and May and sheep and lambs are sold in Stornoway. Lambing was poor in 1958, 50-75 per cent being general, but many breeding ewes and other sheep have died.

241 The only cultivation on the common land belongs to the unofficial holdings. Behind Craigeal, however, there are some old lazy-beds, a well and ruins of a hut, which has not been used since before 1852. There used to be shielings on the far side of the common on Beinn Bhuidhe and
[311] below Loch na Ciste but these have not been used since 1888. Habost is one of the agricultural
[226] townships and fishing is only for domestic use; looms are to be found on only four crofts and
[281] trade is slack. One crofter has a lorry for contracting, carrying peats, fertilisers and stock
[493] to market and two have butcher's rounds in Lochs. There are two small stores.

361 Settlement is scattered, always on elevated ground, and in many cases the new house has
[312] been built in close proximity to the old house site. All have piped water either from the well or
[654] from a rain tank, drinking water being carried in the latter case. Grants from the Crofting Commission are enabling new building and improvements to be carried out.

314

314 FOREST PRODUCTS--exploitation of forests and other uncultivated area
products other than timber or food (e.g., gums and resins, rubber, veg
oils, dyestuffs, medicines, bark, textile fibers, peat); intermediate pro
(e.g., refining of palm oil or rubber, production of charcoal); organizati
labor and production; etc. See also:

Chemical industries . . . . . 38 Materia medica . . . . . .
Collecting of edible materials . . . . . 222 Ethnobotany . . . . . .

There is no bull in Garynahine; the Department of Agriculture bull from Callanish is borrowed. Most crofters buy their milk either from the Admiral at the Lodge or from Stornoway whence a dairy delivers daily.

Eight crofters keep sheep; stocks vary between 5 and 30 per holding. Two crofters exceed their souming (there is no equivalence in Garynahine because there has always been plenty of pasture). With a total of only 166 sheep and lambs on 1800 acres common pasture there is no danger of over-grazing.

The village has a good piped water supply from Loch Mhurchaidh, and has had electricity since 1954. There are excellent communications: 4 buses a day to Stornoway and also one bus from Uig and one from Bernera passing through Garynahine. These good communications have probably contributed to the declining interest in crofting.

There are only three full-time crofters (two of whom draw war pensions). Of the remaining 12 adult men permanently resident, 10 have regular or part time work, the remaining two being to old. Employment is either in Stornoway or at the Lodge. Only two people do part time weaving. Crofting is rapidly decaying in Garynahine. The croft land is reverting to rough grazing, and there is no indication of renewed interest in the land. Instead, life is becoming increasingly orientated towards Stornoway.

CALLANISH by Anne Iredale and Jennifer Oxenbury

Callanish must be one of the original settlement sites of the Hebrides, as it boasts an impressive standing stone circle and two other groups of stones. The stone circle is on a promontory, which projects into East Loch Roag. The promontory rises to about 125 ft, and then the land drops almost to sea-level at the neck (less than half a mile wide) which joins the promontory to the mainland. The township extends inland for about six miles in a belt roughly two miles wide. This inland area forms the common grazing; it is rough hummocky moorland with the general height rising gradually inland; the highest point is 425 ft.

The early crofts were situated close to the stone circle overlooking the Loch. The area was given to crofters who had been cleared from Linshader in the eighteenth century, and it is said that until the Crofter's Act the Callanish crofters had to return to Linshader to work for one day a year in return for this grant of land. But later the crofts on the more exposed westward facing side of the promontory were cleared and replaced by the 90 acre Callanish Farm. Some ruins of the croft houses still remain. The crofts then spread across the low lying neck to the main road from Stornoway to Breasclete, which now forms the boundary between the croftland and the common pasture. The croftland varies in quality, but it is mainly quite good potential arable. Fertilizer and manure are extensively used. Seaweed was widely used in the past but in more recent years the labour of gathering the seaweed has been out-balanced by the lower price of the artificial fertilizer. The main problem of the crofters is one of drainage, and in some parts the drainage channels have to be as wide as the strips of cultivation. Croft 29, situated on a small peninsula from the neck of low lying land, is almost cut off from the mainland at high tide.

The croft houses were then in two nuclei; one on each side of the narrow neck. Much later a third nuclei developed, known as Callanish New Park, further north along the Stornoway road, formed by evicted crofters from Bernera; they had put to sea in small boats with their belongings, and they happened to land at this point. They first became squatters on the common grazing but later gained crofter status.

There are 47 crofts in Callanish which vary in size from 2 acres to 9.7 acres. Some of the larger crofts are a result of private enterprise; the crofters have, without any

Lewis and Harris

133 clay is exposed, leaving what is vividly called 'skinned'
314 land. And where drift is exposed, the mineral constituents
134 are leached out, and a hard 'moor pan' is left a few inches
[356] below the surface.

Seen from the edge of the crofts, the typical 'skinned
134 lands' of bare, blue or brownish clay, littered with stones,
137 suggest a desert. Often, only a few blades of grass or tufts of heather grow on them. Indeed, 'skinned land' seems at first too mild a term, for on it the stones—thickest on top when undisturbed, and bleached by the acids of the peat that overlay them—suggest the prophet's 'field of bones'. One can only ask, is the rest of his vision ever to be fulfilled and life to spring again? In some hilly parts to south and west, not only the 'skin', the topmost layer of peat, but the very soil, the flesh as it were, is still being
[166] stripped bare to the bone, the actual rock. The evacuation of the islet of Bernera Beag (Uig) was largely due to this stripping. In the more level parts to the north, however, roadside pits show sections of clay with few stones, covered with perhaps six inches of clay with many stones. It is this top layer which gives the skinned land such a hopelessly stony appearance, and shows that reclamation is less miraculous than it seems.

134 With the coming of carts and lorries the increasing use
242 of shell sand has become possible, whether for spreading on the land or for slipping into pockets, together with
[178] fertilisers, for potato seed. As to soils, shell sand and boulder clay possess complementary qualities in texture
[493] and chemical composition. The shell sand of the machars provided an early home for man, the light soil allowing rye, a poor variety of oats, and herbage, to ripen early and mature in late, wet seasons when the clays are sodden with rain. Yet the sand itself is so light that drought is

Geddes (1948: 56) gives evidence that joint farms were abolished in Lewis early in the 19th century. Gray (1952: 50) says that by 1819 there was little run-rig left in Lewis. The factor's notebook for Breasclete, on the west side of the island, shows the destruction of clachans around 1850, and their replacement by linear townships.

In the Napier Commission's "Evidence" (1884) for the parish of Barvas, it was mentioned that the rent had been increased because of improvements made by the landlord, Sir James Matheson, between 1849 and 1852. Land had been drained and new townships created; and both old and new townships were lotted and rented in 1850 and 1851 (Napier 1884: 959). The Ordinance Survey map drawn up in 1852-53 reveals several interesting features of Shawbost: "New Shawbost" has recently been laid out; and in an area now incorporated by only a few separate crofts on "Carnan," a cluster of houses appears, perhaps the clachan in which joint tenants lived, and from which they went out to farm their various strips of land, before Matheson reorganized the land in linear strips with dispersed housing. The peat banks in the Carnan area are almost exhausted, indicating a long period of settlement in this area.

As these quotations bring out, the subsidy enables people to risk rearing cattle under conditions that would otherwise make success very uncertain.

5. Communalism: Despite the decline in various agricultural activities and the individuation of land use, some activities persist which require mutual aid. Conditions of low geographical mobility, in which mutual watchfulness and competitive gamesmanship have developed (see section on "Social Marginality"), contribute to the strong boundedness of the township network. There is still competition over who begins an agricultural activity at a particular time of the year. No one wants to be so early that he stands out like an over-eager novice running risks of frost or other bad weather, but there is an element of pride in being the first to harvest potatoes or bring in the peat. Almost everyone cuts peat, a time-consuming and back-breaking job made pleasanter with a large labor force; and every aspect of the activity--the time of cutting and bringing in, the length of time required to cut peats, the size of the peats when dry, the type of meal served to the work crew, the evenness of the final peat stack--is subject to intense scrutiny.

Headrick's recommendations. However, he promised to make experiments on the economic value of the 'bog-ore of iron' found in many parts of the island, with a view to making bar-iron. Peat was to be used as a fuel for smelting.

With so much water on the island, it is natural to expect to find some of it harnessed for the generation of electricity. The Gisla hydro-electric scheme is on the west of Lewis, to the west of the shores of Little Loch Roag. The Harris scheme is at Loch Chliostair, at the foot of the three peaks of Tirgamore (2,227 ft), Ullaval (2,135), and Oreval (2,165). Some 12 per cent of the island's total electricity production is generated thus, the remainder being diesel generation at Stornoway (see Chapter 11).

Next to water, the island's most readily available resource is its stifling blanket of peat, which covers more than 80 per cent of Lewis's land area. It has had a more than significant effect on the natural history of the area, its scenery and the human element. When the deposits were examined in varying detail in 1910-11, it was estimated that they covered no less than 230 square miles, in depths up to 16·5 ft; the average depth of peat over the whole island was assessed at 5 ft. On this basis the deposits would contain approximately 85 million tons of solids. A survey carried out by the Peat Section of the Department of Agriculture & Fisheries for Scotland in 1952 indicated that the earlier estimates were slightly high.

In 1946-7 the Ministry of Fuel & Power reconnoitred the peat deposits on both sides of the Stornoway-Barvas road and indicated that these were suitable for large-scale utilisation. Yet today, despite these Government-backed investigations, the peat deposits of Lewis are still used only for domestic fuel. One of the points made in a 1952 survey was that the area was generally firm enough to take the weight of various bog machines for digging and milling. Another point was that the calorific values of ten out of twelve peat samples were in excess of 10,000 BTU/lb.

CLIMATE

The rainfall has already been mentioned, averaging an annual 43 inches, according to readings taken at the Meteorological

maintained—once an important aid to the survival of half-starved cattle. A slope from the dwelling-quarters down to the byre facilitates drainage: normally the length of the homestead follows the slope. The separation of house from byre took place in Harris and Uist over seventy years ago by County Council decision, but in most of Lewis, even in 1947, about 40 per cent of the homesteads were of the primitive type, outwardly but little changed. This separate cottage, as in Harris, is a shapely little structure, roughly symmetrical and particularly pleasing when the walls are whitewashed below the pale-gold thatch.

The surviving 'black house' is a stone structure. As Stevens has written, "the rock of the island is hard to work, and hard to win", and may be covered by peat. Undressed stones are collected and sometimes carried for long distances. Before dynamite came into use, a very large stone could be broken up by lighting a peat fire on it, then dashing cold water over it. By an old Gaelic custom, the bachelors of a township used to help to build the house for one of their friends who was about to marry. Lime for mortar being absent from the island, the walls are built dry. The wall is double, the space between being filled with earth. Hence it may be six feet thick at the base, though barely six feet high. Typical primitive houses lacked windows, only a little light entering through the smoke vent and through a piece of oiled skin, replaced latterly by a pane of glass let into the thatch of the roof or by a deep window aperture in the wall.

Roof building is a difficult problem in construction, on account of the scarcity of timber and the strength of the winds, and explains the narrow plan. Wood was so scarce that when a house was abandoned the frame of the roof was removed, the spars being the tenant's; but in

[TEXT CONTINUED ON PAGE 82]

couple advancing one on either side of it—many other tasks were definitely team-work. Such was peat-cutting. "When they are making peats, five people are employed. One cuts the peat, another places it on the brink of the ditch where it is dug; a third spreads it on the field, a fourth pares and cleans the moss; and a fifth man is resting, ready to relieve the man that cuts. The women are seldom at this work, but the men help one another alternately; sometimes they must rest satisfied with fewer hands; but the above is the full complement of men required to perform the work, according to their tastes." Buchanan's description was written 160 years ago (1793); it remained true till recently and generally it is so still. There was thus a normal team practice for work—even a man to rest was not forgotten! As the Gaelic proverb puts it: "They won't make power (add strength) without a threesome and they'll limp without a foursome!" (*Cha deanar treine gun triuir, 's bidh iad crubach gun cheathrar*). In Gaelic, as in Scots, one speaks of a team according to its number, as "a pair, a threesome, foursome" and so on, up to a tensome (*deichnear*). In Lewis the farm-team was usually a foursome or fivesome.

Only in exceptional cases was land worked and held singly—as when a smith was kept busy at his anvil in ploughing-time and harvest. Thus in 1715 one or two rural smiths had single holdings of average value or more (£1), and one artificer or tin-smith (caird) a holding of minimum value (5s.); and in the burgh all the small plots were held singly. As the women wove, at home mostly, no male rural weaver held a single plot; his weaving could be done at slack times, so long as there was light; at busy times he worked on the land with the rest of his team.

On the mainland, both Lowland and Highland, an

be high until 1948. The year 1947 was the peak year for the production of Harris Tweed, with over 5,000,000 yards (of which 3,765,000 yards were stamped, and some 1,500,000 unstamped). In 1948 the production of unstamped tweed had fallen to 500,000 yards but stamped tweed came to 4,380,000 yards.

Then, in the year 1948 the imposition of a 66⅔ per cent purchase tax struck the industry a crippling blow. The rise in prices of wool increased difficulties, and by 1950 few orders were being booked and men were being paid off. A few small men who had relatively large stocks frozen by the purchase tax were able to sell them off, but this minor compensation for losses was short-lived. The outlook is disquieting.

(ii) *Agriculture, Peat-making and House-building*, 1938

(a) *Agriculture.*—The estimated agricultural output shows a total value of £189,100, and of this total the quantity fed to animals was valued at £103,000. This leaves £86,100 as the estimated value of crop produce consumed on the Island. Adding this figure to the gross livestock output we arrive at a total valuation of the agricultural production of Lewis of approximately £194,100. To arrive at the average output per croft there was deducted the farm production, estimated at $\frac{1}{10}$ of the total by calculation from known crop and stock returns. This gives a figure for crofts alone of £184,400. By dividing by 3750, we obtain an average value of the gross annual production by crofters as £49, or say £50. The inclusion of squatters' produce would add so slightly to the total figure as hardly to affect the average for rural households. Outlays being small, most of this net output may be regarded as 'net earnings'.

(*b*) *Peat.*—To this sum must be added firing and some share in housing. The peat cut has been valued at £90,000, an average of £24 per croft; it demands much labour. As peat is freely cut by cottars and squatters, etc. (estimated at 1050 or so), the average value might be given as £19 per rural household. In Stornoway the chief fuel is coal.

(*c*) *House-building.*—From 1920 to 1940 the Department of

APPENDIX II

178 2110. The acreage under potatoes declined steadily: 3940,
434 3730, 1650. Barley dwindled from 2350 acres to 1340, and
241 130. Turnips reached a maximum of 510 acres in 1939, but were not worth noting by 1953. These crop acreages reflect the change in stock-rearing, with the decline in the number of
178 cattle but the great increase in the number of sheep. Taking the three successive totals for 1918, 1939 and 1953, cattle
434 numbered 13,620, 9060 and 6540 head; but this diminution
231 by more than half was chiefly due to the small number of bullocks reared. Cows and heifers, 7650 in 1918, still stood at about 4500 in 1953, and they are now of far better quality in weight and milk production. The totals of sheep were successively, 78,150, 114,330, 185,860; by use of mainland rams their average weight has increased, while the wool is rather more abundant but coarser. Taking the Lewis Association's equivalent of 1 cattle beast to 8 sheep, the livestock carry increased by nearly 25 per cent; and if we add the increased value of the cattle the livestock increase counts for very much more. Horses, it is true, fell to 380 by 1953; as before, most had been bought in from Uist, not bred. Hence a new charge on agriculture, the purchase and use of the 65 tractors owned by farmers and crofters, and their running costs, is relatively less heavy than it would be in a horse-breeding area. The poultry are still deplorably few: 86,460, or about 20 per croft.

[632] The Table on p. 316 sums up the conditions, apparently somewhat stabilised for the time being, parish by parish, and invites comparison with Chapter II, pp. 67-68.

178 (b) and (c) *Peat-making and House-building.*—While *peat-*
222 *cutting* is still important, more coal is used than formerly, and hence the peat is valued here much as in 1938. *Housing* is
• 314 most important; Local Authority housing by the Burgh struggles to meet the need of a growing urban and 'suburban'
178 population as in other towns in Britain, but with an additional
362 "remote area subsidy" to meet mainland contractors' extra
647 costs. There is little truly rural housing by the County Council and rents are too high for the houses to be fully occupied. The
63 figures for Stornoway Burgh for the ten years 1945-54 exceed
[162]

175 The new proprietor was no better placed than Seaforth to change the fundamental
427 causes of recurrent poverty and distress. But at least he had funds to ameliorate his
233 tenants' lot and to allow experiments in land reclamation and industrial development.
314 Existing sheep farms were extended and others formed. Land reclamation went forward
• hand in hand with industrial experiments such as distillation of paraffin from peat and
359 brick and tile-making. A programme of road building was begun (the first roads beyond
479 Stornoway were begun in 1791, but there were only 45 miles of road by 1836). In Uig the
226 results were very obvious. Further clearances took place particularly from Timsgarry,
Carnish (21 tenants), Reef (22 tenants), Garynahine, Dun Carloway. The small tenants of
Valtos and Kneep were only saved from eviction by the intervention of the Fisheries Board,
[162] for they were important places for white fishing. By the 1850's, although the population
of Uig was more than double that in 1755, and 60% greater than in 1800, it was crowded
[162] into little more than half the area. Emigration enforced by clearances reduced the population of Bernera and South Uig by nearly 500 between 1851 and 1861.

175 No other part of Lewis saw so many farms; nowhere else did the small tenants suffer
427 so much from eviction. That was not all. Those who remained undisturbed were de-
311 prived of some of their traditional grazings and access to the rest was sometimes
233 restricted. Moreover they had to make room for many of the evicted families in their
own townships, thereby further increasing the problem of congestion caused by the rapid
[161] natural increase of population. Thus, for example, about 1825 there had been 22 families
in Valtos and Kneep. By about 1880 there were almost 100. But, during the same
[162] period these townships were deprived of their island grazings - Pabay, Vacsay, Floday
and Wiay - formerly used for wintering cattle - and of part of their hill grazings (the
traditional shielings). Use of the hill-grazings was restricted, too. Thus, for example,
only one day was allowed to pull heather for ropes; if men were away fishing or for other
reasons, could not attend on that day, they risked punishment by going on any other. Such
stories could be multiplied many times.

In the Bernera district, by the 1850's only Tobson, Bosta and Breaclete (on the
[103] island) and Earshader and Crulivig (on the mainland) were left for the crofter families.
Moreover their traditional summer grazings, which lay south east of the Deer Forest
which was formed out of the Scalascro sheep farm about 1850. Apparently their use of
the old shielings was tolerated until 1878, after which date they were directed to the area
north of the present road and which they have continued to use until the present day. Thus
the shieling huts shown in fig.5 all post-date 1878; the area in which they lie may have
been part of the West Earshader tacksman's holding. The date of discontinuance of that
tack is not known but the house, now empty, was for long occupied by squatters and the
old lazy beds around it still form part of a large squatter holding.

It is noteworthy that almost all the clearances were in the Bernera and South Uig
districts and this is reflected in population changes between 1841 and 1851, shown in
table 4.

The cleared areas included extensive hill and mountain grazings and some of the best
wintering ground, including all the machairs except Valtos and Kneep. The East Loch
Roag and Carloway districts were less attractive to the new farmers; as is so commonly
the case in Lewis, their rough grazings lay on gently sloping low plateaux and were con-
sequently ill-drained and of poor quality. About 1852 Dun Carloway was let as a tack but
was never successfully farmed and was soon returned to crofter-occupation; it may never
have been wholly cleared of crofters. Garynahine, at the southern end of East Loch Roag,
next to Linshader, was also turned into a farm about 1852. Here the hill grazing was more
extensive and, though seriously reduced by a crofter settlement scheme c. 1936, it remains

231 summer, were last used for cattle six to eight years ago by people in Brenish, but none
are in use today. These shielings were at the western foot of Mealisval, only about a
mile from the township. The Brenish 'distant' shielings, about six miles to the south-
east of the township across the mountains, were not used after about 1920, while the
adjoining Islivig shielings were last used in 1922. Mangersta may have had its original
shielings to the east of Loch Melaval about a mile south of the township, but after obtaining
the enlargement from Mealasta farm, until about 1939, shielings were used in that area.

• 314 No peats are cut on the crofts; the peat-cutting areas for all three townships are near
the road and in no case far from the township. The common pasture near the crofts bears
241 evidence of former cultivation, but it is at least fifty years ago since crops were grown on
it. At this time the townships of Islivig and Brenish were over-populated with many
cottars living on the crofts and all possible land on the crofts was already under cultivation.
Today, less than half this 'old arable' is being cultivated, and in several cases the land is
used solely for hay and grazing.

342 There are now no thatched houses inhabited in the townships and most houses have
kitchen and other extensions added. Some crofters have built concrete two-storey byres
312 of modern design. In Brenish, where the hills to the east provide a good catchment area
and the Brenish river a good source of supply, all the crofts have their own private piped
water supplies, while in Islivig and Mangersta most crofts now have, or are getting, a
377 water supply. All croft houses are supplied with electricity from the grid.

226 Commercial fishing has long ceased and as there are only three boats there is now very
301 little fishing for domestic use, the principal use of the boats being to ferry sheep to the
off-shore islands. Weaving is an important occupation. There are seventeen weavers -
286 nine in Brenish, two in Islivig and six in Mangersta, and during 1959 they were kept busy;
461 in 1958, however, few orders were received. Weaving cannot be said to bring in a steady
income here, and some of the weavers, and others, find additional employment outside
[634] the township - this includes four men at the hydro-electric scheme at Gisla, three at
Mangersta Ministry of Civil Aviation station, three at Aird R. A. F. station and at least
407 one in the Glen Valtos quarries. In addition, one man owns at tractor which he hires
out, and one, owning a lorry and van, does haulage work. Altogether, out of a total of
[443] twenty-seven men under sixty-five who do work, all but three (one just out of school and
one a semi-invalid) have other employment in addition to their crofts.

162 The total population for the three townships is one hundred and twenty-one residents,
and fourteen permanently away from home. Of the residents, twenty-eight (or 23%) are
children of, or below, school age, forty-seven (39%) are in the 15 - 45 age group, 15
(12%) are in the 45 - 65 age group, and 31 (26%) are over 65. Of the resident tenants,
thirteen are over 65, twelve under 45, and five between 45 and 65.

181 The relatively young population may help to account, together with the better soils,
for this area giving an impression of a fairly prosperous crofting district compared with
some of the others in Uig. Amalgamation of crofts into larger units has also gone further.
The use of a tractor or horse for ploughing, extensive use of artificial fertilisers, the
sowing of grass seeds and the sale of sheep for meat, all seem evidence of a group of
people who are determined to make the most of their limited resources.

233 One enterprise, that of the Aird Bheag sheep farm, deserves special mention. Four
crofters (three from Brenish and one from Islivig) have purchased from the Uig shooting
estate about 2,000 acres of land on the Aird Bheag and Aird Moire peninsulas, five miles
south of Mealasta. Here they are running a flock of about five hundred sheep. There is

427 joint tenants of one have moved to Geshader while continuing to work the Ungshader land.
632 Another is preparing to move to Enaclete and yet another lives on a feu at Loch Christean
311 Cottage. At present, three working units remain. Enaclete consists of nine crofts with ten units, one being rented by joint tenants.

22/ The rhythm of work is similar to that in other parts of western Uig. Potatoes and oats are planted in April followed by lambing and peat cutting in May. In June and July the sheep are shorn and subsequently sent to the common grazings. In August the peats are carted, once they are dry, by lorry direct to the crofts. Hay-making follows. The lambs are weaned in September, harvest is then carried in and tupping and statutory dipping take place in November. The sheep are then returned to the township grazing though the lambs
241 may be fed with hay on the croft. There is little regular crop rotation and only a small number of crofters seem to undersow oats, thus improving the quality of future hay crops. Gardens are not important and only provide for family needs but Caryshader particularly has a number, some growing flowers as well as vegetables. Fertilisers vary widely from croft to croft as well township to township. Enaclete potatoes are still grown near the shore and thrive on seaweed; those of Caryshader are usually fed on artificials.

23/ Most crofters keep one milk cow with a calf; a few rear a young beast for the autumn sales in Caryshader. However, some now rely on their neighbours for milk in return for grazing and one croft has turned to goats, as giving less trouble. The bull for the whole district is a beef shorthorn and is kept on Geshader-Ungshader common grazing as it is completely fenced; and Geshader is responsible for its upkeep.

233 Lambing seems to have been generally good in 1959 but it was not easy to get exact figures. The Morsgail Estate and Gisla farm also run considerable flocks. The common pastures total 3,119 acres with an enlargement, formerly used as shielings, of 1,215 acres for Enaclete, Geshader and Ungshader near Loch Suainaval, and for Caryshader 88 acres
[314] on Floday island. The shielings have been disused since the war. Peat is normally cut to the west of the road but at least one elderly tenant in Geshader has kept a section of his croft for this purpose to save the effort of working further afield.

241 Generally speaking the land now cropped only represents one third to one half of that
178 worked by spade 20 - 50 years ago when the crofting population was larger and when much greater numbers of cattle were kept through the winter, thus requiring more potatoes and
231 more oats. The cattle numbers are much less than the total souming but sheep are in excess. In Enaclete, at least, overgrazing by sheep has caused a decline in grazing quality.

464 Clearly in these townships, apart from the very few crofts still fully cultivated, the means of livelihood is sought elsewhere. At present there are altogether fifty-three men in the working age group (15 - 64) in all four townships. Of these fourteen are away, nine permanently and five periodically. Thirty have regular or periodic employment besides crofting and of these seven work at Gisla on the hydro-electric scheme, seven weave, some of them part-time, four hire out vans, two do post-office work and others have varied occupations while only three are full-time crofters. At present there are few men in the Merchant Navy and fishing does not provide an occupation although many share rowing-boats in their spare time, and fish for domestic use.

162 The population as a whole is ageing and of the group between 15 and 64, forty-four
(164) (roughly 30%) work away permanently or have emigrated. It is noticeable that there are few crofts worked by people with young families

000 In conclusion it may be re-emphasised that the fate of the crofting townships depends more

TABLE 29

241 vation at all, but even fewer crop more than 2.6 acres (table 29). Expressed as a percentage, little more than a quarter of the total inbye area is even "old arable", of which only about two-thirds is cultivated. Oats are every-where the most important crop: they are used almost exclusively for fodder. Potatoes, mainly for domestic use, are the only other significant crop; the absence of turnips is noteworthy. The crops are in general subject to some sort of rotation within the physical limits of each croft unit; oats are usually undersown with grass when the arable is to be left unploughed for a period but the "sown grass for pasture" is
[314] largely reseeded pasture land. The rest of the croft is left for pasture and hay, and, in many cases the cutting of peat - a sure sign of agricultural decline. The inbye economy depends upon so many unpredictable variables that it becomes extremely difficult to generalise about the areas thus used. Forty-seven gardens exist in the Berneray region, but many of them are almost 'notional' and others are merely potato patches: perhaps half-a-dozen are at all well cultivated, for flowers or food.

241 The main change in the crops grown, apart from the introduction of sown grass, has
178 been in the corn crops, where barley has been completely displaced by oats. Barley was grown up to 1936 - at least in Crulivig - and gave a good crop. It used to be pulled, (not scythed), stacked, then the ears cut off with a sickle and the stalks used for thatching. Probably the disappearance of thatch and the replacement of barley bread by the products of the town bakery account for the decline in barley. Fewer potatoes are grown than formerly: this directly reflects the decline in population. The absence of turnips is due at least in part to the heavy incidence of finger-and-toe disease.

000 weather although the wells on the lower ground never fail. Mains electricity was installed
354 7 years ago, but on the whole cooking is still done by Calor Gas and peat. The chief source of fuel for heating purposes is peat, although a little coal may be used.

427 There are 63 registered crofts, including many subdivisions, a small-holding of 15
[341] acres formerly the Mill, and 10 feus, all of which are worked as 54 units. The crofts lie as long narrow strips in a NE - SW direction from the moorland to the sea. All are at least partly fenced, the fencing being of recent date. Some crofters are, at the moment, making use of fencing grants to enclose their land completely.

241 The only crops grown are oats and potatoes, and although a little clover mixture is sown for hay, many crofters find that the natural grass is sufficient for their needs. Vegetables are produced in a few gardens, but most people do not have enough time or interest to bother with them. Flowers rarely flourish owing to the lack of shelter.

311 Far less of the croft is cultivated now than in the past, and the land nearest the shore,
[178] part of which was once cultivated on a run-rig system is now unfenced and used entirely for grazing together with some peat cutting. A piece of the common grazing has been improved by application of shell sand and chemical fertilisers and reseeded. This experiment in which almost the whole township took part has proved very successful and there are plans for further reseeding. Details of crops are given in Appendix C.

[147] Although the tractors of which there are two in the township are used wherever possible,
[231] the spade is still used on many small patches, particularly for potatoes. Much hay is cut by mower but scythes are used to a large extent. There is still one horse in the township but it is scarcely ever used for ploughing except by its owner.

233 The total number of sheep kept in the township is 1,500 i.e. 2½ times the souming which here is 2 cows and 5 sheep per £1 sterling rent. 40 crofters keep sheep but none have sufficient to make a livelihood from sheep alone. Many lambs are lost on the
231 moors during the summer and more fail to survive the winter. The number of cattle kept is 84, i.e. only 1/3 of that permitted. It is usual for each household to keep 1 cow and 1 calf which is generally sold after 6 months when a subsidy can be claimed. Breasclete has no bull, but shares the one from Callanish. Most households keep sufficient poultry for their needs but no eggs are marketed.

Shielings were still used to some extent up to 1938. Now it is not necessary as fewer cows are kept than formerly. With the reduction in numbers of stock the common pastures close to the village are being colonised by heather.

22/ The crofters' year begins at the end of March when the ditches are cleaned and the
241 land is prepared. In April the ground is ploughed, fertilised and sown with oats and
233 potatoes. The sheep are dipped and by the 10th of May must be out on the moors as the
[314] crofts are then closed to common grazings. Soon after this peats are cut on the moors two or three miles from the village. After about 20 days the peats are lifted and carried to the Penland Road by tractor where they are stacked to await the lorry which takes them to the village.

In June, the sheep are gathered into the fank for shearing and the cows are usually brought to graze on the crofts from the nearby moors. If the croft is not fenced they must be tethered. At the end of June the clover is cut, while the potatoes must be cleaned and hoed. In August the lambs are weaned and dipped. Natural grass is cut for hay and if there is any first year sown grass this may yield a second crop in September, together with the corn harvest. When the potatoes have been lifted in October the crofts are opened and the sheep are brought in for the winter. Final dipping takes place in November.

162 Out of a total resident population of 226, 56 are under 15 years and 57 are over 65 years of age. Of the resident tenants 9 are between 15 and 44 years, 19 are between 44 and 65 years and 26 are over 65 years of age. Twenty on persons are periodically
000 away e.g. students and seasonal workers and 29 are permanently away. Since 1939,

[Seaforthhead]

161 Table XVII reinforces the idea that there is a striking dichotomy between the agricultural
162 and fishing townships. The former are characterised by a more stable population trend,
166 significantly fewer of the population in permanent employment furth of Park, and a smaller loss
167 migration. In the fishing townships, where growth and decline have been equally meteoric,
241 there is a larger proportion of persons in permanent employment furth of Park, and migration
222 losses have been greater. It is also significant that there is a smaller natural increase of
152 6.5 per cent in the agricultural townships. The only township which shows a natural decrease over this period is Caibost, one of the fishing townships.

SEAFORTHHEAD AND SHIELDERNISH

Rachel A. Hirst

131 Seaforthhead and Shieldernish are separated by 4,485 acres of rough grazing, the former lying on the northern shore of Loch Seaforth and the latter on the southern shore of Loch Erisort.

SEAFORTHHEAD

135 Seaforthhead, the most isolated of all the Park townships, consists of three crofts and a
161 gamekeeper's holding. The township boundary is situated between the 50 and 75 foot contours which at their furthest extent are only 150 yards from the shore. Immediately behind the road the land rises very steeply in rough uncultivable moorland covered with many boulders but generally below the road the land slopes gently at about 5-10 degrees, in places being
[247] completely flat. Here, however, the lazy-beds are very boggy and rushes have appeared in the ten years since cultivation ceased.

134 The soils are deep near the shore due to soil creep; higher up they are very thin and peat
137 accumulates to at least 3 feet both below and above the road. There is little cover; bracken is rare, but silverweed and heather, moorland sedges and grasses soon colonise disused lazy-beds.

241 Legally there are three crofts but only one is still cropped, the other two being used solely
[255] for grazing. There is, however, a gamekeeper's holding within the township boundary worked as a croft. The other two crofts are used as ancillary grazings to holdings in Aird Ghruach and Balallan and have not been lived on for forty years and ten years respectively.

[246] The chief crops are oats and potatoes, though the gamekeeper had a patch of turnips and
the other croft had grown them during the last few years until 'finger and toe' developed.
[407] Patches, about half an acre in extent, are drained with stone drains and ploughed by tractor, after which potatoes are grown to clean the soil, followed by oats for one year and then sown hay for three to four years. This is not strictly adhered to and several lazy-beds appeared to be
[319] in natural hay. There is no peat-cutting on the crofts as peat is secured just outside the
[251] township fence on the common pasture. Lambing has been poor for the past two years being only 50 per cent in 1958; the stock carried is twice the sheep soum. The cattle, Highland and Ayrshire or Shorthorn crosses, are below the soum, but previously nine cows and followers have been kept.

161 There has been a great decrease in population and cultivation since the resettlement in
162 1886. In Seaforthhead and Shieldernish as a whole, there were twelve crofters before the
241
178

[Caversta]

241 Each croft is fenced but has a gate giving access to the common grazing, in which each crofter
291 holds an equal share. The township has no specially enclosed area for fanking or other purposes
and no fixed date exists on which the crofters open their gates for winter grazing. Breeding ewes
[221] are normally brought in for tupping in mid-October and November when crops have been gathered,
and lambing takes place in late March or April. After dipping and inoculation with vaccines for
black leg, braxy and louping ill, the sheep are put out on the common grazing in the second or third
week of May.

231 The 642 acres of common pasture support a sheep stock equal to the sheep soum, but the overall
233 stocking is only 88 per cent of the total souming. Two crofts only exceed their individual soums,
while the others are well below the number required for greatest efficiency. The grazing is, however,
poor for summer pasture, owing to the lack of grass, but the heather is valuable for wintering the
[236] hogge. Lewis Blackface sheep are the predominant breed and the wool, clipped in July, is sold to
the Stornoway mills and the animals themselves are sent to the slaughter house. The 1958 loss
at lambing was exceptionally high owing to a cold, dry spring preventing the growth of grass for the
ewes. More than forty lambs and thirty ewes were lost by the township last winter, a number four
or five times greater than the average loss.

Six cows, two heifers and four calves are kept in the township and tethered most of the year on
[227] the crofts. Calves are born throughout the summer months, but whereas early-born calves may be
sold in the Autumn at six months old, those born later must be wintered to eight months until the
Spring sales. The cows are served by the Department of Agriculture Highland bull at Habost, but
although good prices are obtained for beef cattle, it is felt that for the family milk supply, a dairy
bull would produce a better strain.

241 In addition to keeping stock, oats are cultivated on five holdings and potatoes on six. In
244 most cases the land under each crop is less than half an acre and nowhere does it exceed two acres.
245 The land has been built up into lazybeds about six to ten feet wide, separated by open drainage
[307] channels and worked by the spade. There are only two holdings where a tractor (hired from Habost)
is used and the acreage cultivated only amounts to three-quarters of an acre. Conditions are not
altogether suitable for mechanisation at present, for the terrain is very uneven and broken up by
marsh and steep faces of bare rock.

[691] Neither Torista nor Caversta is on a main road. The former is served by a track joining the
road near Cromore, while the latter has a secondary road running as far as the township dyke, and
an inferior footpath joining the main road at Garyvard. The lack of a good road within the dyke
acts as a deterrent to the use of modern equipment and fertilisers. Byre manure is used on all
the crofts and seaweed is brought from the shore and spread on the lazybeds. Artificial manures,
used on only three crofts, must be carried over rough ground from the dyke. This lack of incentive
to improve is perhaps even more marked by the fact that on one holding alone is a rotation
practised - potatoes, oats undersown with clover, then hay for three or four years. Apart from
this one instance, potatoes and oats are sown, perhaps alternately, on the same strips for many years.
Natural grass yields the bulk of the hay and is often cut from lazybeds that were formerly cultivated.
On one croft there is upwards of quarter of an acre where the old ridges can be seen to have a
crescentic shape and are thought to date back more than one hundred years. A short distance beyond
the township dyke is a similar stretch of land, now colonised by heather.

314 Peat still forms the principal fuel and, apart from one half acre patch within the dyke, is cut
379 on the common grazing, as near the road as possible in May and June, and later brought home by
382 creel, bicycle or tractor. Three of the six operative units still have gardens and all keep up to
twenty chickens; rowing boats for line fishing, solely to supplement the larders, are also maintained.

In 1841 population records show that there were twenty-two persons at Caversta and seven at
[501] Torista. After 1881, when maximum figures of fifty-nine and nineteen were noted, there was a
161 secondary peak in 1911 in Caversta, followed by a steady drop to twenty in 1951 and eighteen in 1958.
162

[Cromore]

The crofters sowed
241 clover with their oats in 1957; the quality of most of the natural grass could be improved considerab
291 by extending this practice. Several of the crofters have taken advantage of the facilities for obtain
[248] lime and fertilisers, but seaweed and byre manure are widely used. Only seven crofts have
237 vegetable plots this year but that of No. 23, (partially enclosed by a dry-stone wall) has produced
324 crops of lettuce, cabbage, turnips and carrots.

221 The souming for Cromore is one cow, one heifer and eight sheep per £1 rental, but is not
231 enforced. The crofters keep the stock which they can manage to maintain throught the winter and
no one appeared to be dissatisfied with this arrangement. In fact the souming is exceeded by only
233 seven crofters and the total stock for the township is only 75 per cent of the soum. Lambing takes
[236] place in April and May and often a high proportion of ewes and lambs is lost. The sheep are
clipped in July and each crofter usually clips his own sheep. He either sells the fleece or has it
spun in Stornoway before weaving it himself. The lambs are taken from the ewes during the secon
week of August and then dipped; November is the tupping period and almost every crofter had his
own ram. Most crofts have a cow and a calf and the crofters like the calves to be born in March
so that they are six months old in October for the Garyvard sales. The cows are served by an
Aberdeen-Angus bull from Crobeg Farm. The township gates are opened in October and the cattle
remain within the bounds until May. An interesting regulation enforced by the Grazings Committee
is that each family can have only one dog, and that it cannot be taken on to the Common grazing
without special permission, or on fank days.

178 Shielings, situated on the common grazing between Calbost and Cromore, were used until
the 1890's. Active land use has gradually declined; in the 1920's, much of the outrun was under
233 cultivation and from an an air photograph, it is evident that hay was being taken on the strips
311 above Cromore in 1946. The present trend is a continuing decrease in the amount of arable land b
[242] this year ten crofters formed a group to enclose and improve a ten-acre plot on the common grazin
it is unfortunate that all crofters are not willing to take part. Peats are now being cut near the
[314] road between Caversta and Gravir, about three miles south- south-east of Cromore and one mile
north of Gravir.

17 Cromore was once a prosperous fishing village but now it has no fishing boats. Two Cromore
228 fishermen work on other boats (one from Marivig and one from Stornoway) and there are a few men
who would welcome the opportunity to start fishing again. There seem little prospect of this,
[506] however. The landing-stage, completed in 1957, is regarded by many as a 'white elephant' and,
in fact, at low tide it is useless. So much for the hopes that it might have been used by cargo
vessels bringing goods to Park.

288 In Cromore there are fourteen looms for the weaving of Harris Tweed. Tweeds are obtained b
[433] road from two mills in Stornoway and one in Airidhvruach. At present the average production is
only one tweed per loom per week but the weavers could quite easily double their production. Duri
the past two years this industry has been comparatively prosperous. Knitting is a winter pastime
[236] but only for pleasure, although one household possesses a knitting machine.

162 In common with the rest of Park, Cromore has a high proportion of old people. Many from the
166 middle age groups have sought employment on the mainland, and the teenagers, many of whom have
167 been at school in Stornoway, seek jobs there or on the mainland, returning for holidays and assisti
164 with the croft work. Some younger folk are resident to care of aged parents.

491 Cromore is only eight miles by sea from Stornoway yet all communications with the town are by
[434] road - a distance of thirty-two miles. There is a daily bus service and the sub-postmaster has a v
which is occasionally hired. Some people recalled that the only route to Stornoway was once by
[493] boat to Crossbost and thence by bus. One resident owns a lorry and this is used for most of the
haulage in Cromore, particularly for bringing home peats during the summer. As a result of recen
additions to the roads, only three crofts remain inaccessible to vehicular traffic. There are no
366 shops in Cromore but grocery vans call on Monday, Tuesday, Wednesday, Thursday and Saturday;

[Marivig]

231 There are only fifteen cows, two yearlings and four calves in the township, and the crofters with no cow rely on neighbours, or on tins, for their milk supply. All but two of the crofters keep sheep, there being four hundred and eleven ewes, one hundred and eighty-five sheep and two hundred and thirty-four lambs belonging to the township. The common grazing (including the off-shore islands which are grazed by five different crofters each year) is used for the sheep in summer, while [235] all but one of the crofters winter their sheep within the township dyke on the crofts. Most crofters keep hens, and surplus eggs are sold to the Stornoway vans.

314 Peats cut on the common are transported by lorry to the crofts, while peats from the north end of 482 the peninsula separating Loch Marivig from the sea must be carried in creels.

Nearly every crofter owns a rowing dinghy which is moored in the loch off the end of his croft, 228 and with this supplements the family food supply. One herring boat, operating nightly from Stornoway 501 and returning to Marivig at weekends, is all that is left of a fairly large fleet which operated before the war. A second boat, unused for two years, lies shored up on the beach, and two others are wrecks. Over fifty years ago there was a curing station at Marivig. One crofter fishes lobsters during the winter and markets them in London.

463 Of the other crofters, only two supplement their incomes by weaving, one by working on the 464 roads while several men work partly on the crofts but are periodically away whaling in South Georgia, fishing, or on hydro-electric schemes. Several others are in the Merchant Navy. The gradual 468 migration from Marivig, especially of the young people, is reflected in the high average age of the 467 permanent residents, and in the numbers in the school - over one hundred pupils in 1900, thirty-nine 462 (including sixteen from Calbost) in 1946; but only nine (none from Calbost) in 1958. The young 471 people leave the township to train or work on the mainland (generally in Glasgow) or in Stornoway, while their elders accept the view that "there is nothing for the young people here".

205 The township has a Post Office and telephone kiosk which also serve Calbost, while lack of a 206 shop is partially compensated by a choice of four vans from Stornoway and one from Gravir. There 366 is a daily bus from Gravir via Marivig to Stornoway and back: the return is over 10/-. The road 496 which reached the township from the west in the late 1920's has a tarred surface and is much 458 better than the later road southwards to Gravir which is untarred. There is no church in Marivig 491 and most of the population attend the Free Church in Gravir.

346

Within the township the two arms of the township road serve all but two of the crofts and the 363 sites of the newer houses, few of them more than thirty years old, tend to be near the road, while 361 the ruined houses found on most crofts are often nearer the sea. Only two thatched houses remain 342 and the other inhabited houses are built of stone roofed with asbestos slate, or of corrugated iron. 377 All the crofts are supplied with electricity from the grid, but very few have a piped water supply: 312 rainwater is collected from the roofs and piped for washing, with a separate piped supply from a well for drinking. All other houses draw water from wells.

829 The stormy winter weather, rocky terrain and poor soil are all blamed by the residents for the drift of population away from the crofts, but those who remain have little incentive to work the 900 crofts more efficiently owing to the very hard labour involved. It is suggested that with more intensive cropping and more cattle, each croft could make a comfortable profit and surplus milk, potatoes and eggs could be marketed in Stornoway - the milk replacing that at present brought from the mainland. Such development, perhaps on a co-operative basis, together with a revival of the fishing industry and introduction of a tourist industry, by building a small hotel or guest house and attracting anglers as well as those who simply wanted scenic beauty, might bring prosperity back to a township which otherwise may well be derelict in the next twenty years. But the capital required for the two latter enterprises is not available within the township.

[Orinsay]

253 The future existence of the common pasture for grazing is being seriously endangered by overstocking. The souming is not enforced in Orinsay and the actual sheep stock exceeds the [314] by 300 per cent. Peat-cutting is gradually destroying valuable grazing areas; in the last three years there has even been some peat cutting on the better grazing on the island. The dangers of overstocking and of indiscriminate peat cutting cannot be overstressed.

311 No evidence was seen of attempts to improve the quality of the common pasture. The esta 292 ment of shelter belts would provide not only shelter but a means of stopping the peat from 'slu down slopes if they were carefully sited. Much of the common pasture could be improved by drainage scheme and by re-seeding, after sanding and liming, a project well within the capaci the resident labour force.

241 Good crops on a few of the crofts suggest that the land is not inherently sterile, however, it would seem that if the holdings were reduced to a maximum of four, an economic existence be feasible on these crofts. The stony nature of the soil limits the possibilities of tractor cul but with an improvement in drainage, one might be used in the two valleys.

464 It is not so easy to be optimistic about the employment of surplus population resulting fro [268] such an enlargement of holdings, although a revival in the fishing industry could absorb most of the present there are no looms in Orinsay and providing the Harris tweed industry can hold its ov are possibilities in weaving. Seaweed is in plentiful supply. Indeed Lemreway people also ob [324] supplies and should its quality prove adequate, the establishment of a processing plant would p valuable employment.

000 Nevertheless it is becoming increasingly obvious that unless the holdings can be enlarged, officially or by sub-letting, and some further employment created, Orinsay is liable to stagna depopulation to continue. The township which was developed to relieve congestion is now itse congested.

SUMMARY AND CONCLUSIONS

121 The aim of the Glasgow University Department of Geography Crofting Survey is to record analyse material relevant to the crofting districts, and in so doing provide a clear and impart statement of the present situation. In inviting us to undertake a survey of Park, the Pairc As tion hoped that a body of fact would be assembled and conclusions drawn which would assist th Association in their admirable aims of advancing the well-being of the area. Their two Prog Reports, of 1956 and 1957, indicate that they have already investigated many of the possibiliti development. This summary refers to Park alone, and, it must be emphasised that until the of crofting is completed, no final assessment of the Crofting Area as a whole can be made.

182 The district of Park is one of the more isolated and difficult crofting environments. The of the terrain, the high proportion of land of very low agricultural value and sheer isolation 175 existence of human communities precarious. In addition, many of the Park communities wer 311 established as a result of population pressure in more favourable areas of Lewis, and the ori small settlements grew rapidly as a result of a change in land use which was a national trend conversion of poorer areas from subsistence farming to an extensive sheep-rearing economy impact of this change came to Park in the form of the eviction of a large body of small farme favour of an extension of the grazing area. Thus the present conditions are a legacy of the re recent past, and of legislation, particularly in the Crofters' Act of 1886, which accepted, an agreed to the maintenance of a larger population than the land could reasonable carry. Two [161] Wars and fluctuating economic factors have had repercussions in Park and resulted in a chan [162] economic and social values, and depopulation has resulted: the 1951 population was 60 per ce the 1911 total.

1. The Commissioners proposed that only holdings rented at £6 and over should have secur tenure, with a view to discouraging the perpetuation of grossly uneconomic holdings; in t all holdings were given security of tenure.

133 most northerly outlier, yet, in the main, one is struck not by the variety of rocks (except for the 'Stornoway Beds') but by their homogeneity. It is structure, causing the uplift of certain masses relatively to others, more than differences in rock-type, which has guided the work of erosion, in sculpturing both the Island's plan and the details of its forms. Submergence of the land has fretted the coastline into a zigzag line of ridge-capes alternating with valley-mouths flooded or 'drowned' by the sea, as inlet and loch.

• 316 Historically the gneisses were of little value. The fact that they tend to split still helps the Islander in building, [174] as it helped his ancestors when they raised the great stone [172] circles at Callanish on East Loch Roag. Except where they are very basic (non-acid) in composition, they make [135] poor road metal. Yet the gneisses are not quite devoid of economic minerals, which include masses of pegmatite, and the only large body of anorthosite or lime-feldspar rock in Britain, conceivably a source of alumina for glass [439] manufacture.[1] Two feldspar quarries opened at Lingarbay and Northton in South Harris in 1941 employed sixty men during the war, the mineral being despatched from Leverburgh for use in the Staffordshire Potteries in the manu- [178] facture of porcelain insulators. The higher grade mineral in Scandinavia and the better transport facilities there led to closing the quarries, with little hope of their reopening.[2]

4. *Land-forms and Sea Floor*

133 To the faulted structure is due not only the Island plan, but the highland in middle and south, uplifted rela-

134 Alluvial soils have developed along the lower reaches of Amnuinn Thoraghair and the Erista river.

137 There are no trees apart from an occasional stunted rowan or willow - willows for [024] creel making grow still in some old garden enclosures. Hedges, too, are rare so, althou individual houses are often carefully sited, there is little cover and the townships as a whole are very exposed to westerly gales. The natural vegetation developed on the machai is of fine closely matted grasses with a good deal of natural clover - very similar to that found on chalk downland. On the peaty moorland the usual moor grasses mosses and heather are dominant, though little encroachment by bracken was noticed.

In Crowlista the strip layout of the crofts dates from a lotting about 1850, (Figure 14) 311 in the new townships, laid out about 1921 (Figure 15) the majority of the crofts are 361 less strip-like and do not run to the shore. Indeed in Ardroil and Timsgarry only five 427 out of twenty-two reach the shore and the rocky headlands with their machair are valuable parts of the common pasture. The six crofts in Carnish run from the shore at the foot of the esker up its flank towards the southwest and almost to its summit. They also have one or two small plots each on the machair.

[133] Crofts in Ardroil are in one piece. An old cattle road forms the north west boundary; from this they rise, steeply in places, to undulating moorland just over 200' high. Numbe 5 - 8 Timsgarry are strips across the Erista valley, rising northwards to just over 170'; 2, 3 and 4 are allotted to make use of arable land on the lower slopes of Knock Valabrie. The houses of crofts No. 1 Timsgarry and No. 1 Ardroil are the former farmhouses.

[417] In Crowlista most of the crofts remain unfenced but in Carnish, Ardroil and Timsgarry all are fenced and many of the fences were being repaired or replaced in 1959. They are not open for common grazing during the winter. Patches of sown hay are fenced within each croft.

• [36] There are six recognised croft-holdings in Carnish; one is sub-let so that there are only five "operative" units; two of those are not worked. One has been resumed by the proprietors and is being quarried as an extension of the main quarry between the township dyke and main road. In Ardroil each of the fourteen crofts is worked as a unit - though two carry no stock; in Timsgarry eight crofts are worked as seven units.

In contrast to the above, the old settlement of Crowlista has twenty-five recognised crofts but, by amalgamation and sub-letting these are worked as fourteen units. The Crowlista crofts are small - fourteen are 4.0 acres or less and of those only one is worked as a unit. Crofts as small as 1.5 acres and with a soum of eight sheep can never have been intended to support a family; they are the result of sub-division in earlier generations; the remains of two piers and a curing house point to the importance of [464] fishing in the past. Twenty-one men were employed in fishing boats about 1914. Sub-letting usually takes place between relatives; of some of the fourteen operative units are quite complicated. One example will suffice (croft numbers are here replaced by letters to prevent publication of personal matters):-

Crofts a, b, c and d are worked as a unit (although they are not adjacent). The tenant of a and b sub-lets c and d for grazing; he also helps with the work on yet a fifth croft. The present b is half of an original croft. West of the road the original croft is held in fixed runrig between b and another croft, not part of this multiple "working" unit; east of the road it has been divided into separate strips. The tenant lives on b.

233 hundred and thirteen - but most crofters had from forty-five to one hundred and twenty. Wedders are sold at two-three years old when the mutton is said to be at its best.

231 Parts of the common pasture - usually the machair, are set aside for wintering hogge but the usual practice is to keep as many as possible on the croft. The soum as a whole
[427] is not enforced but shares in the wintering parks are adhered to. For example:- Timsgarry Glebe is leased to Crowlista and one share entitles a crofter to winter twenty-five hogge on it. In Ardroil one share allows one cow or four yearlings or eight sheep or eight hogge
[232] on the machair - in practice it is the best hogge that are sent. The minister at Timsgarry, who is much interested in sheep husbandry, has bred a heavier sheep with longer legs by crossing the Hebridean blackface with Swaledales and these seem to be doing very well; the minister is more attentive to his sheep than are many of the crofters, but some local crofters are showing interest in this crossbreed. The lambing percentage, so dependant upon the winter and spring weather, was about 80% in 1959 and this was regarded as good.*

Enquiries show that some crofts in each township far exceed their soming but because others carry no stock the four townships are understocked according to the total soum, here expressed in cow units. Sheep stocks in Timsgarry approximate to the sheep soum, Crowlista is overstocked by 130%, while the other townships are understocked.
[239] Some of the figures used for sheep stock were approximate or estimated. Nearly all crofts keep some poultry and surplus eggs may be sold to the grocery vans.

The rhythm of work on the croft during the year is shown on Figure 16, overleaf.[1]

241 Part of the hill common west of Crowlista was cultivated until the beginning of the
175 present century, at which time the township was overcrowded with two or three houses on
[361] each croft. A similar area west of Carnish was cultivated and old lazy beds, now grazed, are to be seen on slopes south of the road in Ardroil, in the valleys of Amhuinn Thoraghain and Ailt a'Gharaidh and on the Borranish peninsula. The ruined shieling huts for this area, still to be seen around and beyond Loch Suainaval were in use until 1934 - '35. (Figure 5).

464 Ancillary employment is sought by all but nine of the thirty men under sixty-five in these townships and the wives of two of the 'full-time crofters' have regular employment.
228 There is no commerical fishing by local boats though the Bernera lobster boats are seen frequently off Uig Bay. The ruined curing house and piers at Crowlista, and the 'port' shown on the O.S. map near the site of the clachan in Carnish, point to the former importance of fishing.

288 At present the weaving of Harris tweed from yarn supplied by the Stornoway mills is more lucrative. There are two looms (plus one other weaver) in Carnish, two in Ardroil, three in Timsgarry and two (plus one other weaver) in Crowlista. All these looms were in use and two tweeds woven a week bring in a useful income but the supply of weaving is irregular. The future security of these weavers depends on the prosperity of the Harris tweed industry.

464 Mitchele's sand and gravel quarry at Carnish provides employment for from three to
[316] ten men. Five men from Ardroil and one from Carnish are employed there at present.
712 The Aird R.A.F. station draws most of its civilian employees from Aird Uig but two
377 Ardroil men work there. One Crowlista man is employed at the hydro-electric scheme
446 site at Gisla and this work will last for another year or two. Employers recognise the particular needs of their crofter employees and 'days off' are allowed for sheep fanks and other necessary work.

* The minister's ewes gave 103%.

CHAPTER NINE

THE ISLAND OF BERNERA AND ADJACENT DISTRICTS OF THE MAINLAND OF LEWIS

('Bernera and Bernera Shore')

by

P. Wheeler

131 Of the three main sections of the parish of Uig, the Bernera district, consisting of Bernera Island (Breaclete, Croir, Hacklete, Kirkibost and Tobson) and the "Shore"
[103] (Earshader, Crulivig and Lundale together with the isolated township of Linshader), presents a number of peculiarities due not primarily to physical conditions, but to isolation
[491] Bernera Island, though central to most of Uig and easily accessible over the sheltered waters of Loch Roag, yet remained relatively inaccessible overland until the recent building of the road bridge; even now it is necessary to travel over six miles to get from
[181] the bridge to the main Uig road and a further four miles to Garynahine. Consequently the island, even more than the adjacent mainland settlements, has a very close-knit and self-sufficing population. Whether this community retains sufficient vitality to resist the destructive effect of better communications in addition to the general forces eroding rural and especially Highland life, remains to be seen.

13 The district shares the unpropitious physical characteristics described in the Intro-
228 duction. Like the other districts it has virtually no valuable mineral resources (1), and the herring and white fish industries have all but disappeared and seem unlikely to
[173] resuscitated. Lobster fishing is, however, prosecuted with vigour and enterprise; it
464 provides a good living but only for a small group of families. The rest depend on regular or casual employment to eke out the proceeds of the croft. The kinds of work
[164] available, and the problems of permanent or seasonal absence in search of employment are common to the whole parish; thus this account is mainly concerned with the problems of crofting agriculture.

Settlement: history and patterns.

172 The pattern of settlement in this inhospitable and discouraging environment is partly very old, and partly very recent. At least four brochs are known on Bernera and various
361 standing stones of even earlier date, while continuous settlement has survived from the
[173] early Christian era. Traces of old patterns and practices remain, in tangible form as in the graveyard on little Bernera, or in oral tradition. All this contributes towards the very close network of family relationships that binds the island folk and to a lesser extent those of the adjacent mainland.

175 With the exceptions of Tobson, Bosta and Breaclete, all Bernera Island had been
361 cleared by 1851. Resettlement began in 1878 when twelve families were moved from Bosta to Kirkibost, and continued at Hacklete in 1880, and subsequently elsewhere. Occasionally (as at Kirkibost) old, pre-clearance lotting patterns were re-adopted, but usually settlement was laid out afresh. The townships of Bernera Shore, were also affected: all the small tenants except those of Earshader and Crulivig were cleared, leaving the land under the sheep farms of West Earshader and Linshader. However, the Bernera Island crofters were allowed to continue their customary use of shellings on the mainland, and the transfer in 1880 of these grazings to their present position marked the

[316] (1) A small deposit of diatomite has been exploited in Kirkibost since 1959. Only a few men are employed and the number is not likely to increase.

[TEXT CONTINUED ON PAGE 61]

wnships the large crofter is given an allocation in 427
ion to his rent. The payment of his rent also entitle 241 [233]
fter to gather seaweed along the coast for fertilizer 221
cut peat for fuel on the common grazing or in special 314 ●
eas. In a number of townships he has a further right [233]
ure his rams in a "tup park" and his horses in a "horse
These are lowlying areas of improved pasture. There
general picture.

here are three important exceptions to the typical 427
f land tenure. First, there are the Glendale crofters 423
their land. Each individual has purchased his croft, 421
members of each township own the common grazing col-
ly. Before the law they are no longer entitled to the [254]
s of crofting status because, by legal definition, the
is a small farmer who rents his land. Second, there [233]
crofters of six Kilmuir townships who have individual
f "outrun," good lowlying cattle pastures, in addition
normal crofter's holding. Even though the Glendale
s are landowners and the Kilmuir crofters have their
tle pasture, they are subject to "souming" regulations.
there are a few large, isolated crofts which are self-
ed units. The individual has his own cultivated land,
, and rough grazing. In reality, many of these large
s are farms, but as long as the annual rent does not
£30, the benefits of crofting status are not withdrawn.
fter, of course, stocks his holding as he thinks best.
he Irish and Scottish Highland systems of land use

mamured, harrowed, and limed his fields. Normally, he will 221
have a tractor to speed his work. In the meantime his wife 241 [363]
prepares her small kitchen garden. By the time he has sown 221
his oats and set his potatoes and turnips, the ewe sheep are 231
ready for lambing. Lambing begins during the last week or two
of April and runs through the middle of May. This is one [462]
activity which is exclusively man's work. It is also a chore
which demands an early start from individuals who are normally
late risers, seldom getting started before eight or nine in
the morning. Now, all day long, from early morning until late
at night, day after day, the crofter or his shepherd are found
on the hill watching and waiting for the lambs and their
natural enemies, the crow, the hawk, and the fox. During this
time, he does not neglect feeding his cattle nor finishing
putting in his crop if inclement weather has hindered his
progress. Then, too, he may have a cow ready to calve. His [462]
wife will then add milking to her regular household duties.
Men have only recently begun to milk.

After lambing, the family must decide whether or not 221
they are going to take time out for cutting peat. As I have 314 ●
already said, it is unlikely that the man of the house will
want to bother. He has enough to do caring for the sheep and 221
lambs and preparing his cattle for the May markets. Although 231
he could attend the local sales which are held at convenient 432
locations around the island, the large crofter has found the
mainland market of Dingwall attracts buyers willing to pay
higher prices.

As far as I know only one attempt has ever been made by the 231
smaller holders to sell their cattle at the large mainland 432
markets since the last drove left Skye in 1906. There was a
feeling at the close of the Second World War among the crofters
that they were not receiving a fair price at the local sales.
The Scottish Wholesale and Cooperative Society, which had be-
come interested in the Highland Problem, offered to handle the
marketing. Their cattle buyer, a man of wide experience, found
the Skye cattle to be of high quality and suggested shipping
them to the Stirling market. This is one of the largest in
Scotland has the advantage of attracting a full range of buyers.
Since the cattle were not at their best after the long sea
voyage, they were provided with hay and pasture for a week
after arrival. Unfortunately, a disease epidemic in the
South forced a postponement of the market. Nevertheless, they
arrived at the auction block in good condition. The prices
obtained, an average of £1 or £2 more than they normally re-
ceived at the local sales, convinced the crofters that there
was no advantage in selling on the mainland. Actually, if
the Society had not paid the expenses of shipment and feed,
the crofters would have suffered a slight loss. Those who
attend the Dingwall sales say they used the wrong market.

While the man who devotes all of his time to his 221
pastoral-agricultural occupation finds it uneconomical to 314 ●
bother with gathering seaweed for manure, fishing, or cutting 241
peat, the crofter of the category we are discussing often
adheres more closely to the traditional cycle. After the

lambing season, the crofter and his family go out on the moor 221
to cut their peat for the following winter. The man uses a 241
"tusker," a two-bladed spade, to cut the peat. His wife or 314 ●
his children follow behind, tossing the peats out of the ditch [313]
and building small, loose stacks for drying. After the lambs
have been marked and the sheep dipped in June and the shearing
finished in July, the family returns to the banks to carry
the peats to the nearest road, actually a beaten cart path,
in creels. They are then carted home and stacked near the door.
There is a growing tendency for both the part-time and spare- 314
time crofter to give up cutting peat. It is not because coal 198
is cheaper or he needs time for other pressing chores. His 241
auxiliary occupation will not permit his devoting the necessary [464]
time to this long and arduous task. He is caught between the
traditional economic patterns and the money economy of which
he has become a part.

The year for our part-time crofter, as for all active 221
crofters ends in November. By then the oat and hay harvest has 241
been stacked by the house and the potatoes and turnips stored 236
in the ground, the wool shipped off to market, the surplus [233]
sheep and cattle have gone to market, and the rams are on the
hill. Now follows a period of enforced idleness, broken by
feeding the cattle. As we have seen many go away to find [464]
employment, leaving the care of the croft to their wives who [543]
have shared the work of crofting in addition to their own
womanly responsibilities. We must turn to the spare-time
crofter to discover just how heavy the burden of labor may [462]
depend upon the women of Skye.

strongly about this infringement of the traditional norms. 837
Gossip spreads very rapidly. The offenders are said to be 434
"no better than the tinkers." While tinkers are respected [564]
because they have the power of the evil eye, they are not [754]
accorded any more prestige than we would give a beggar. All
who have any contact with the neighborhood or the village
where the deviants live soon know all the details. Since [367]
most of the adulterers on Skye have been in Portree, it adds
another brick to the wall which separates the rural neighbor-
hoods and the trade-center village. The offenders normally
leave Skye as quickly as possible.

The Sgriathanach cannot be said to have a strong sense 423
of property, or, more correctly, the land is valued as a 421
place of residence and identity not as something to be bought
and sold. We have seen that he uses his land communally and
that he often will not leave a will for the house, not to
mention his land. Even though the state thinks otherwise, he
looks upon the natural resources of the island as his for the
taking. At the same time, he normally respects the fruits of 421
his neighbor's labor. Any one can cut peat on the moor, but 314 ●
no one, except an unthinking tourist, would take a piece of
turf once it had been cut. In a similar way, the children are 257
generally well behaved. In the village there is a bit of stone
throwing, a little profanity, and uncommonly some drinking on
the sly, but rarely do children show any disrespect for the
rights of others. One contractor, a Lowlander who came up to
Skye to make alterations on the school, was amazed. Skye

better economic units. There could well be plants for fish meal 433
and canning, working in conjunction with fish-farming ventures. 185

Perhaps one of the most significant events which have occurred was the formation in 1972 of the Lewis Development Fund Limited. The Company has the following aims:

1. To strengthen and expand the economy of Lewis and in consequence that of the Western Isles by promoting and encouraging the development of all the natural, economic and industrial resources of Lewis and the Western Isles.
2. To encourage the repopulation of the Western Isles and to encourage industries in the island to obtain the necessary staff and labour.
3. To encourage the building of shops, factories, public works, churches, places of amusement and any other works which the company might think fit.
4. To encourage tourism.
5. To promote and carry on businesses such as building, fishing, buying and selling, agriculture and manufacturing, etc.

The Company has given itself wide powers to lend and borrow money. A target of £150,000 is envisaged, which funds will then be used to help all kinds of economic and socio-economic ventures.

Surveys carried out in the Minch area in 1971 by British 315 •
Petroleum and the Gas Council have indicated the possibility of oil. While there are no signs of the traditional anticlines—the dome-shaped geological structures—which normally signify the presence of commercial quantities of oil or gas, there are hopes for secondary sources in the more complicated rock-structures which could be oil-bearing. The sea-bed of the Minch is young rock of the type which bears oil in other parts of the world.

The assumption, in 1974, by the Western Isles Regional 185
Authority of most of the functions of the mainland local authori- 433
ties is thought by many to be a chance to sink or swim. Having been for so many decades under the thumb of external influences, the islands now are being given the opportunity to devise relevant methods for ensuring their socio-economic viability in the future.

All in all, the island is going through a period of re-stocking,

316

Keepint the sea-
weeds company are the whelks, razor-fish, limpets and mussels, 136
winkles and barnacles, many once used for food, but now left to [262]
grow in great numbers, to the delight of seabirds.

For anyone who wishes to have a full list of the richness of fishes found in the inshore waters of the island, there is the Harvie-Brown and Buckley volume (1888) in the *Vertebrate Fauna of Scotland* series. Of the ocean fauna, most famous of course are the common and the grey or Atlantic seals, the latter being one of the largest and most robust of British mammals. A great breeding place for the common seal is the island of Shillay, which lies a mile or two from Pabbay, off the western end of the Sound of Harris. All the island's outliers, North Rona, Sulasgeir and the Shiants, afford a place for breeding. The basking shark, the porpoise, and the blue shark are among other large creatures that frequently haunt Hebridean sea-waters.

LAND WEALTH

135 In minerals the island is poor. Feldspar was quarried in Harris
• 316 during the second world war, but it is doubtful whether the workings were economic. The feldspar quarries opened at Lingerbay and Northton in South Harris in 1941 employed some sixty men, the material being sent from Leverburgh for use in the Staffordshire Potteries, for the manufacture of porcelain insulators. The high-grade mineral found in Scandinavia, and the better transport facilities there, led to the close-down of the Harris quarries. At Lingerbay, however, a small quarry yields anorthosite, a white granite used as an abrasive for cleaning products. A recent survey discovered deposits of asbestos on the island of Scarp to the west of Harris.

135 For some reason there has been, through the centuries, a be-
#195 lief in the mineral wealth of Lewis. As far back as 1616 the records of the Privy Council show an entry: 'Ane patent ardanit to be past to Archibald Prymrois of the copper and lead mynes in Ila, Sky and Lewis.' The Fife Adventurers and the last Lord Seaforth were also optimistic. Lord Seaforth went so far as to commission a survey on the resources of the island by a mineralogist, the Rev James Headrick, in 1800. Nothing much followed Mr

621
631 has direct or indirect communication with Glasgow, Stornoway
[505] and North Uist. In summer a thrice-daily bus runs to Stornoway,
[494] and once a day a bus makes the round trip of East and West
[361] Harris. The township, linear in pattern, east to west, includes six-
[366] teen shops which cater for most of the needs of the population
[368] within reasonable travelling distance; it also has two cafés, a
[873] post office, a licensed hotel, a hall for social functions, a masonic hall and two churches. The Sir E. Scott School here is the only secondary school in Harris with an academic stream.

Most of the working population is employed in the service industries, the professions and the tweed industry. Tarbert was a
[504] fishing port of some significance in the past, and is now a re-fuelling point for ships.

464 The absence of organised industry on a large scale, such as
[167] Lewis has, is a factor which tends to bring nearer to reality any desire on the part of Harris natives to leave their native soil. There are small pockets of industry, but these are only dabs of easing
463 ointment on the excessive unemployment sore of 27 per cent. The
[241] main occupation is of course crofting, the income from it being
[434] augmented from a variety of sources. Some crofters concentrate
[286] on the production of Harris Tweed, perhaps using the wool from
[386] their own sheep; the natural dyes from the lichens which grow on the rocks and from other plants are still used occasionally. Others specialise in knitwear. Recently shell-craft and wood-turning have been added to the traditional crafts, with a view to the
[226] tourist market. Fishing, of course, plays a part in the economy in some communities. The interest of such organisations as the Scottish Country Industries Development Trust has been concentrated on the potential in shell-fish processing, and the production of knitwear on a larger scale than exists at present. Road-
[464] work gives employment to about thirty men, but is of course seasonal.

• 316 An apparently bright light on the employment horizon showed itself in 1965, with the opening of a quarry at Lingerbay. The mineral quarried was anorthosite, a white granite used as an abrasive in cleaning products. A 99-year lease was taken out by a subsidiary company of William Robertson (Shipowners) Limited, Glasgow. But the quarry was closed in 1967 due to lack of orders.

316 •
Fourteen employees were directly concerned, with another six in 464
the services sector.

The potential of the tourist industry is only beginning to be 484
tapped. MacBrayne's drive-on drive-off car ferry, with a capacity [505]
of 50 cars and 600 passengers, makes two or three trips a day between Uig in Skye and Tarbert, the journey taking less than two hours. The mainstays of tourist accommodation in Harris are 484
the Tarbert and Rodel Hotels, both well appointed and owning 485
fishing rights for salmon and trout. Sea fishing is another tourist 529
attraction. Crofters participate in the holiday trade by offering [226]
full board or bed and breakfast, caravans, caravan sites or vacant lets.

An interesting tourist venture has been started at Rhenigidale. 484
A rough, stony track, one of the most tortuous and exciting in 487
Britain, takes its leave from the main road over a ridge. It twists 529
and turns in and out of gullies, over cliffsides and across the steep heather-clad slopes of the Toddum, a dramatic little hill of 1,730 ft which protects Rhenigidale village from the Atlantic gales. The [205]
seven-mile track is the only marked route, though crofters take a shorter way to the north over pathless bogs; the local postman makes a round of about 60 foot miles in the week, walking this track and on to Tarbert three times in all weathers. The village 504
relies on its sheltered harbour with a good natural rock pier: 361
most communication is by water, all food and fuel coming that 505
way. In past times every household owned a boat for lobster and 501
shell fishing to supplement both diet and finances. Today the 226
interest in fishing has declined, as has the population. But in 1946 485
Mr Herbert Gatliff paid his first visit to Harris, discovered what the island had to offer, and started a campaign to convince hostelling interests of the need to make some investment in the Western Isles. A croft house in Rhenigidale was in 1961 equipped as a hostel, and under what is now the Gatliff Trust it is maintained for hardy trekkers, the Scottish Youth Hostels Association making a grant for running costs. Many visitors have found that the place offers a degree of happiness corresponding with its remoteness from civilisation.

342 maintained—once an important aid to the survival of half-
343 starved cattle. A slope from the dwelling-quarters down to the byre facilitates drainage: normally the length of the
[178] homestead follows the slope. The separation of house from byre took place in Harris and Uist over seventy years ago by County Council decision, but in most of Lewis, even in 1947, about 40 per cent of the homesteads were
342 of the primitive type, outwardly but little changed. This separate cottage, as in Harris, is a shapely little structure, roughly symmetrical and particularly pleasing when the walls are whitewashed below the pale-gold thatch.

342 The surviving 'black house' is a stone structure. As
343 Stevens has written, "the rock of the island is hard to
[314] work, and hard to win", and may be covered by peat. Undressed stones are collected and sometimes carried for
[324] long distances. Before dynamite came into use, a very large stone could be broken up by lighting a peat fire on it, then dashing cold water over it. By an old Gaelic custom, the bachelors of a township used to help to build the house for one of their friends who was about to marry.
[333] Lime for mortar being absent from the island, the walls are built dry. The wall is double, the space between being filled with earth. Hence it may be six feet thick
[354] at the base, though barely six feet high. Typical primitive houses lacked windows, only a little light entering through the smoke vent and through a piece of oiled skin, replaced latterly by a pane of glass let into the thatch of the roof or by a deep window aperture in the wall.

342 Roof building is a difficult problem in construction,
343 on account of the scarcity of timber and the strength of
313 the winds, and explains the narrow plan. Wood was so scarce that when a house was abandoned the frame of the
[182] roof was removed, the spars being the tenant's; but in

CHAPTER IX

ECONOMIC CHANGES: 1750–1919

(A) TRANSITION: MIGRATION, FISHING AND KELP-MAKING

175 433 [621] [427] [794] [437] UNTIL the 'Forty-five the township had lived an almost self-contained life. Its traditional economy was self-sufficient except for two indispensable commodities—salt for the housewife and iron for the smith. Beyond this, the chief demand for payment was the rent to the lord, with tithes for the kirk. For these needs and demands a step towards production for exchange was required, the more so that what was exported might include the very necessities of life in 'bad years'. The rent was paid largely by the sale of a surplus steer or two, and 175 317 drovers called for the cattle. By 1790, if not before, two or three open boats set out annually from Uig, for instance, 436 for Glasgow, laden with salt beef and dried salt fish. Although salt seems of little account today, it once bulked [435] large in the Budget, its price being heightened by duty, especially after 1707: "as dear as salt", was a saying, *cho* [251] *daor ris an t-salluinn*. Salt was needed to preserve the carcase of a 'cattle-beast' or sheep killed in autumn, and 175 433 for cod and herring curing. Wrecks were valuable, as on all infertile undeveloped coastlands, both for their timber and their iron. Cairds or tinkers occasionally brought [326] metal goods; or a packman called, as strange a figure then [443]

133 Over most of the parish the natural landscape is a series of low plateaux, generally below 250' O.D. around East Loch Roag, but rising westwards to an extensive platform with many summits around 500'-700'. Into this platform, towards its western edge, is incised the narrow trough containing Little Loch Roag. Above it rise the deeply dissected mountains of North Harris and south west Uig, with many precipitous slopes reaching to 1,500' or more and summits to 1,885'. The discontinuity between plateau and mountain is particularly well displayed along the Atlantic coast, where it corresponds roughly with the junction of granite and gneiss; an even more severe discontinuity, but formed entirely in gneiss; is to be seen near the south end of Loch Langavat. Liuthaid (1,611' O.D.) rises more than 1,400' in less than a mile. The mountains, although lacking height, are therefore spectacular in appearance. The low plateaux are far from featureless, too; their surfaces have been roughened and scraped bare by ice action and numerous hollows preserve shallow lochans and a few larger lakes. Occasional rocky hillocks rise 20'-100' above the plateaux; their abrupt discontinuity with the smooth surfaces is entirely comparable, though in miniature, with that of the mountains. They resemble nothing more than tropical inselberge and have no apparent structural explanation.

Unconsolidated superficial material, such as would provide sub-soil drainage and suitable raw material for soil formation, is rare. The characteristic surface almost everywhere is bare rock, often blanketed by peat at lower levels and on gentle slopes. Morainic material is most commonly preserved in hollows; peri-glacial conditions and, 135 more recently, heavy rainfall have swept clear most of the higher and steeper places. In the east and north east, e.g. around Loch Carloway, a sticky grey clay with large boulders is sometimes seen; the coarse gravelly drifts of south Uig have already been mentioned. It is impossible to make any useful generalisations regarding the characteristics and distribution of the boulder clays because their occurrence is so sporadic and exposures, [317] beneath the peat blanket, are rare. Very occasionally, e.g. in Bernera, a finely bedded dull bluish or greenish grey clay is seen which is said to have been used for coarse pottery. This may be a lacustrine deposit of late glacial or early post glacial times or it might be a marine clay of the same period; there is however, no clear example of a raised beach in the area, which, were it present, might support the latter suggestion. [317] Since our visit a lacustrine deposit of diatomite has been exploited on a small scale in Bernera.

Extensive deposits of fine white sand occur around Uig bay and in the Valtos-Kneep-Reef area; smaller deposits occur at Mangersta and Mealasta. Except at Cliff bay, Valtos, where it contains a high mineral content, the sand consists largely of finely broken shell debris. This blows readily and is found inland for half a mile or more and as high as 100' O.D., thus providing a natural surface dressing rich in lime. There are extensive machairs (sandy plains) at Kneep and Reef, and smaller ones at Uig bay, Mangersta, and Bosta (Bernera). Little cultivation takes place on the machairs nowadays.

133 In the whole parish little soil, such as would be recognised by a lowland farmer, is to 134 be found. The most usual surface features are bare rock and blanket bog; arable land, h meadows and improved pastures are generally made on peat, gathered together into long [407] narrow beds - so-called "lazy beds" - separated by deep ditches. This expedient may [23] mean that the use of tractors is impossible; since horses have almost disappeared, cultivation in such cases, if carried out at all, must now be by the spade alone. This is 133 the traditional method of lazy-bed work; it may be very productive in terms of yield per 134 square yard but it is pathetically unproductive in terms of man-hours. In some areas it 241 is clear that it has led to soil erosion. Even where the size and lay-out of the beds permits tractor work the tractor probably spends as much time manoeuvering into position and turning, as it does ploughing. In a few places, e.g. some of the East Loch Roag

[TEXT CONTINUED ON PAGE 7]

Something has to be done to keep the people here." A Glendale crofter put it more forcibly: "There aren't enough men in Glendale to man a row boat. They've lost experience. One crew after the last war lost their boat because they didn't know how to use it. If depopulation isn't stopped, there soon will be no need for any of these remedies." Fishing, then, is one of those subjects which is often discussed and about which little is done. Let us turn to a consideration of the less traditional occupations open to the men of Skye and their womenfolk.

Minor Supplementary Industries

Diatomite. Diatomite, the siliceous remains of minute organisms laid down in fresh water lake beds, is found in quantity in drained Loch Cuithir, near Staffin. After extracting, drying, and pulverizing, during which process it loses 70 percent of its weight, it has innumerable industrial uses, ranging from filters for the manufacture of beer, sugar, fruit juices, and petroleum products, through abrasives, to fillers and insulation material. Attempts to work this large and high quality deposit go back seventy years. To date, however, the success has been indifferent. The omnipresent lack of capital, difficult access through rugged terrain, and technological barriers have been limiting factors. Within the last few years outside investment, about £180,000, with a limited amount of local capital has stimulated the industry once again. A road was built by the government to replace the old tramway, long in disrepair and

finally scrapped for ammunition. Drying sheds have been erected at Staffin. Power machinery for extraction has been brought in; a processing plant has been built at Uig with German equipment; and experienced men have been employed.

The industry is admirably suited to the island. The great weight-losing properties of the raw material, the scarcity value of good deposits, and the large commercial demand combine to offset the high cost of transportation from which most export items suffer. It is estimated by the directors of the company, an English concern, at least that fifty men will eventually be employed in the pit and at the plant. They will be given regular employment, five days a week in three shifts. In addition to building the access road the government, through the Department of Agriculture, has leased the site, and the Inverness County Council has erected subsidized housing at Uig to encourage the venture. When the Secretary of State presided at the opening of the plant in May, 1954, he spoke of the promise the industry held for the Island's future, especially the prospect of regular employment. Up to June, 1954, however, the employment was irregular and limited to sixteen men.

The Skye Tweed Industry. About twenty-five years ago a small weaving and basketry shop was established at Duntulm in Kilmuir. The factor for the Department of Agriculture acted as manager, and the local Church of Scotland minister was the foreman. Later it was taken over by the Highland Home Industries, a cooperative, non-profit corporation.

323

323 CERAMIC INDUSTRIES--manufacture of pottery and glass; preliminary processing of materials (e.g., cleaning, mixing); shaping (e.g., modeling, use of molds, coiling, blowing); firing; special apparatus (e.g., potter's wheels, kilns); methods of decoration (e.g., glazing, painting, incising); ceramic products not elsewhere described; specialization (e.g., potters, glass blowers); industrially elaborated ceramic manufactures (e.g., bottle making, porcelain manufacture); etc. See also:

Interior decorating	353	Decorative designs and motifs	531

175 Around this time, various factors had encouraged
[161] an increase in population. After Scotland's union with England in 1707, the prohibition on the import of cattle into England was lifted, and trade in cattle became economically more important (Day 1918: 26). The numerous wars of this period caused the price of cattle to double between 1736 and 1766 (Day 1918: 180). Clan warfare diminished; the potato was introduced; and vaccine for smallpox became available.

175 The increase in population led to an extreme
161 crowding of land in some areas, which made agricultural
[166] reform difficult. Many landlords tried to encourage tenants of their estates to emigrate. The appearance of a market for kelp, which lasted from the middle of the 18th century to about 1815, discouraged landlords from implementing policies of depopulation that would
175 diminish their labor force. An alkaline extract of
824 kelp was used in a variety of manufactured goods, such
• 323 as soap and glass. The seaweed was gathered by men,
388 women and children living along the coasts, and burned in rough open kilns. Tenants who worked at this
[465] occupation received L3-4, and the landlords L18-20, per ton (Mackinlay 1878: vii); the landlord received as high an income as L10,000 to L20,000 a year from the burning of kelp (Gray 1957: 42).

286 womenfolk, giving a ratio of only one male weaver to fifty-five
462 families. In Lewis, male weavers were more common: one to
*175 every twenty-five families. The making of whisky was introduced
433 about the seventeenth century. This was in addition to the old drink of home-brewed beer or ale *(lionn)*, and much of it was
273 made to pay rents; it must have consumed a considerable quan-
*175 tity of valuable foodstuff. However, the spread of distillation as a
433 legitimate home industry by which the rent could be paid, in kind
[427] or by sale, was followed by legislation prohibiting all but very
[438] large stills; illegal distilling of course went on in a small way.

*175 It was, then, by a very narrow margin that subsistence was won
511 in the island some two centuries ago. Many times famine showed how close was the wolf to the island doors. The introduction of the potato, and the interest in the fishing industry led to an increase in the population, though as discussed in Chapter 3 this in turn brought more problems. Basically, the island economy had never been organised on a sound foundation, with the result that winds of change blew where they would with little or no control.

*175 A new factor in the island economy was introduced after 1750.
824 This was kelp-making, the cutting and burning of seaweed on the
• 323 shore for subsequent use in the manufacture of alkali for the glass
388 and soap industries. The first tentative move in the island was
433 made by MacLeod of Harris in 1748, when he allowed some Irish labourers to make kelp on his shores; so little was the product's value realised at the time that he only charged them 2s per ton manufactured. As the burning of kelp came to be understood, and the marketable value of the product ascertained, the native population set to. Between 1772 and 1864, about 50 tons were produced in Lewis each year, compared with some 800 tons per annum in the Uists; the Harris figure was 500-600 tons. The growth of the industry began to snowball, and the Minister of Lochs, writing in the *Old Statistical Account*, states that at the time (1796) some 50 tons were being produced in that parish per annum. In Stornoway parish, though no figure is available,
[221] the minister reports that kelp-burning was the principal manufacture, and that everyone able to fill a creel, or carry one, was employed at it for about three months of the year. Little of it seems to have been done in Barvas parish. The price of kelp varied

according to the amount of barilla (its great competitor, a carbonate of soda made from plant ashes) which found its way into the British market. When the American war interfered with the imports the kelp price was as high as £22 per ton. Prices began to decline about 1810, and from 1822 successive reductions in duties on salt and barilla resulted in the decline and demise of the kelp industry. As a consequence great distress appeared in those districts which had founded their whole economy on seaweed.

The weeds of most value to the industry, because they yielded most salts, included *laminaria digitata, laminaria bulbosa, ascophyllum nodosum* and *fucus serratus*. One ton of kelp yielded an average of 8 lb of iodine, with certain quantities of chloride of sodium, chloride of potassium, and carbonate of soda. When subjected to special treatment and distillation, 2-3 cwts of sulphate of ammonia, and several gallons of naphtha, paraffin oil, and volatile oil were also derived.

The fishing industry, discussed in the previous chapter, took over where the kelp-making industry left off and became another king-pin in the island economy. By the end of the last century it seemed set fair for continuing prosperity. In 1900, harbours were being planned and built with State aid in Uig, at Carloway, Ness and Tarbert. Then 1914 came, and with it sweeping changes in international trade. Island fishermen were left workless with wrecked and rotting fishing boats. In twenty years the number of Scotland's fishermen was halved; the remainder were all but ruined. The islanders' fate mirrored this pattern.

Yet another significant source of income for island families for almost 200 years came from the men in military service, who either sent money home or returned home with their gratuities and pay. In the wars of the last century many enlisted in the Highland regiments, the Navy and the Merchant Marine. Even today, the income from this external activity is not insignificant.

EIGHTEENTH-CENTURY ECONOMY

Information and statistics about the economy of the island in the middle of the eighteenth century are to be found in Walker's *Economical History of the Hebrides or Western Islands of Scotland*; his MS is in the British Museum.

landlords to improve passenger regulations at that time.

Wars brought enlistment in the Highland regiments, the Navy and Merchant Marine. Owing to migrations of all kinds, males came to be outnumbered by females, then as later (100 males to 114 females, 1931).[1] In Lewis in 1795 the proportion was 100 to 111, and in Harris 100 to 124. From this period onwards the 'export of men' continued, modified by the reserve for war. Men were trained for the Naval Reserve and Militia; and in 1900 for instance 800 men were training at Fort George and 2500 sailors were in the Reserve. The maintenance of a reserve for the Navy was one of the strongest pleas for the framing of the Crofters Act.

A new resource, important to the Islanders after 1750, was kelp-making, the cutting and burning of seaweed upon the shore, for use in the manufacture of alkali in the glass and soap industries. From 1770 onwards the price rose, heightened first by an import duty, then by the Napoleonic Wars. Estimating from the high prices, averaging over £10 per ton from 1800 to 1823, Sir John Sinclair put the value of the annual produce (20,000 tons) at £200,000. "It may appear surprising", he remarks, "how that sum could be of such importance to 80,000 people"; but he goes on to point out that this gave the additional cash needed to supplement their subsistence. But even when Sinclair wrote in 1825, the industry was in peril. Failure and loss occurred almost immediately after, with disastrous effect.

It is complained in the *New Statistical Account* that owing to the summer-time work of kelp-making up to 1830, the people could give little attention to the crofts, so that their extension must almost have ceased. Nor could

[1] In 1951 the ratio in Lewis was 100 males to 112 females, and in Harris, 100 to 110.

324

324 STONE INDUSTRY--methods of shaping stone (e.g., chipping, pecking, grinding); materials used; products not elsewhere described; special stone industries (e.g., carving of tombstones and monuments); specialized personnel and organization; etc. See also:

175 827 463 [205] Whatever the rationalization, cobbler fathers begot cobbler sons. The present postmaster's grandfather was the first postmaster in Shawbost, and when help is needed in delivering the mail it is the postmaster's first [767] cousins who are likely to help out. As late as the 1950's, the township still had its own undertaker, a man who had learned from his father the art of laying out and dressing the body but who didn't like the job very much and was happy enough to turn it over to an undertaker who traveled from Stornoway.

463 [232] The island has had a veterinarian, based in Stornoway, for the past 30 years or so. Earlier, certain blacksmiths and farmers treated ailing livestock when the crofters [278] [155] needed them. For human ailments, there were many cures by plant and spell.

463 326 The man who was the last village blacksmith died not long ago. His smithy was in the center of the village. [342] His home and smithy were mortared stone buildings with corrugated iron roofs that were once estate houses for the men who worked the experimental farm established by Sir James Matheson in what is now New Shawbost. The blacksmith was also a shopkeeper and butcher. As a 463 326 874 blacksmith, his work was principally shoeing horses and making harrows and peat-cutters, which he did with the aid of one and sometimes two apprentices. One of his

463 326 874 [204] [521] One of his apprentices was his sister's son, who built another smithy not far away. "This was the center of gossip. People gathered there while he shoed horses that came from Barvas to Carloway."

444 178 [494] A number of shops were established in Shawbost that sold clothing, cooking ware and groceries. At one time they numbered six altogether. These shops also ran the first buses between the village and [477] [443] Stornoway. Gradually these businesses disappeared because of competition with larger companies. Mobile grocery vans and butcher shops and bakers began coming in the late 50's, and gradually took over the trade in large parts of the island, undercutting the local busi-178 434 571 621 nesses. Income from weaving had already weakened self-sufficiency derived from the intensive use of land and sea and also weakened the formerly heavy reliance on local ties and mutual aid. Today an army of town-44 463 178 dwelling entrepreneurs and employees constitute a major proportion of the traffic on the island roads. Grocers, [472] [484] fish dealers, bakers, sellers of soft drinks, garbage collectors, insurance salesmen, mobile banks, coal dealers and others extend goods and services from centralized sources to a market which has money to pay for them. The island's participation in this extensive market system is affected by its marginality to the

175 476 couple advancing one on either side of it—many other tasks were definitely team-work. Such was peat-cutting. "When they are making peats, five people are employed. 175 476 One cuts the peat, another places it on the brink of the ditch where it is dug; a third spreads it on the field, a 314 fourth pares and cleans the moss; and a fifth man is resting, ready to relieve the man that cuts. The women are seldom [462] at this work, but the men help one another alternately; sometimes they must rest satisfied with fewer hands; but the above is the full complement of men required to per-[127] form the work, according to their tastes." Buchanan's description was written 160 years ago (1793); it remained [178] true till recently and generally it is so still. There was thus a normal team practice for work—even a man to rest was not [538] forgotten! As the Gaelic proverb puts it: "They won't make power (add strength) without a threesome and they'll limp without a foursome!" (*Cha deanar treine gun triuir,* [802] *'s bidh iad crubach gun cheathrar*). In Gaelic, as in Scots, one speaks of a team according to its number, as "a pair, a threesome, foursome" and so on, up to a tensome (*deichnear*). In Lewis the farm-team was usually a foursome or fivesome.

175 Only in exceptional cases was land worked and held 423 singly—as when a smith was kept busy at his anvil in ploughing-time and harvest. Thus in 1715 one or two 241 rural smiths had single holdings of average value or more [324] (£1), and one artificer or tin-smith (caird) a holding of minimum value (5s.); and in the burgh all the small plots [286] were held singly. As the women wove, at home mostly, [462] no male rural weaver held a single plot; his weaving could be done at slack times, so long as there was light; at busy times he worked on the land with the rest of his team.

000 On the mainland, both Lowland and Highland, an

CHAPTER IX

ECONOMIC CHANGES: 1750–1919

(A) TRANSITION: MIGRATION, FISHING AND KELP-MAKING

175 433 [621] [427] [194] [430] UNTIL the 'Forty-five the township had lived an almost self-contained life. Its traditional economy was self-sufficient except for two indispensable commodities—salt for the housewife and iron for the smith. Beyond this, the chief demand for payment was the rent to the lord, with tithes for the kirk. For these needs and demands a step towards production for exchange was required, the more so that what was exported might include the very necessities of life in 'bad years'. The rent was paid largely by the sale of a surplus steer or two, and 175 317 drovers called for the cattle. By 1790, if not before, two or three open boats set out annually from Uig, for instance, for Glasgow, laden with salt beef and dried salt fish. 436 Although salt seems of little account today, it once bulked [435] large in the Budget, its price being heightened by duty, especially after 1707: "as dear as salt", was a saying, *cho* [251] *daor ris an t-salluinn*. Salt was needed to preserve the carcase of a 'cattle-beast' or sheep killed in autumn, and 175 for cod and herring curing. Wrecks were valuable, as on 433 all infertile undeveloped coastlands, both for their timber and their iron. Cairds or tinkers occasionally brought [326] metal goods; or a packman called, as strange a figure then [443]

175 433 as some Indian pedlar one meets on the road may seem now. An older packman's tale of his long tramps, of the [326] people's poverty and hospitality, must have resembled [443] the mingled plaints and praise one hears from an Indian pedlar today! But in the past only a speaker of Gaelic [191] could find his way among the people. Almost until 1900, if not still later, Gaelic speech was to prove a social bond, [197] but ignorance of English speech an economic barrier.

175 433 463 [178] The transition to increased exchange, with migration, permanent and temporary, tended to make for specialisation. About 1795, *Statistical Accounts* enumerated, for every hundred families, two or three smiths, wrights (or carpenters), a shipwright or some boat-makers, a few weavers, tailors, and perhaps a miller. Each of these held some corn land, individually or in shares, with rights on the common. The line between plain crofters (to use a later term) and crofter-craftsmen was not easily drawn, and different writers wrote as they judged best. In Lochs, 80 per cent were fishers and net-makers. On the open shores of the west, in Barvas parish (in which three-fourths of the men were also 'fishers'), kelp-making was a seasonal [427] occupation. In Stornoway parish, where sub-tenants paid 30s. to 60s. in rent, with twelve days' service, they sold ling to their tacksmen at 5d. each, earned £1 a month on herring boats, made kelp at 30s. per ton, and roads at 8d. a day.

175 286 462 In Harris in 1795 the eight 'bred' (or trained male) weavers worked only for 'the gentry': the laird, the tacksmen and their families. The rest of the weaving was done by the women, giving a ratio of only one male weaver to fifty-five families. But in Lewis male weavers were commoner—one to every twenty to thirty families was the ratio—as if the practice of home weaving by the women was less universal there, even at that date.

THE PEOPLE

175 In 1899, the Medical Officer of Health for the Parish of Bar-
342 vas described the typical Lewis crofter's house of the time. It had three apartments, two for the family, and a third for the cattle; this new arrangement was the result of the Regulations issued by Sir James Matheson for the betterment of the estate. The low
[333] thick walls were built of stone, or stone and turf, with a packing of loose earth, and were perennially damp. The roof, composed of a framework of wooden rafters and couples resting on the inner edge of these walls, was covered over with turf divots and straw, bound with ropes of straw, heather or coarse thatching rope, and weighted down with stones. It was never air- or water-tight, and roof water usually soaked into the packing of the walls and thus oozed into the house. Further, only the slightest attention was given to situation and drainage. The floor of the dwelling apartment was composed of a pavement of rough stones covered over with clay—and a cold damp floor it was. The cattle apartment had
[231] no pavement, so that the manure liquids and slop water percolated into the ground and at times found their way into neighbouring dwelling houses and even into the drinking wells. Many of the houses were built back-to-back and sometimes in rows three deep. Lighting was deficient and the windows, fixed either in walls or roof, were not made to open.

175 Some houses had round portholes in the roof at the top of the
342 wall which might be opened or closed at pleasure; these served
354 for lighting and ventilation at the byre end of the house, though occasionally they were present also at the living end. Draughts coming in through the roof and walls, and the blazing peat fire in the centre of the middle apartment, helped to keep the air in motion, but the smoke from the fire frequently filled the upper portions of the room and, there still being no chimney or other outlet as a rule, it pervaded the whole atmosphere of the house.
175 From a sanitary point of view such houses had the gravest of
342 defects: it amazed visiting doctors that infectious diseases were
[164] ever absent. Yet generally the inmates compared well in physique, general well-being and immunity from serious disease with those more favourably situated. Tuberculosis was the most prevalent enemy.

[422] In 1879, improving leases were offered to those who were will-

Lewis and Harris

A HARRIS VIGNETTE

346 Linking the present day firmly with an ancient past is the probably fourteenth-century church of St Clement's, at Rodel. It is an outstanding building, and the only considerable architectural monument in the Western Isles. Built of rubble, dressed
• [333] with schist, and freestone which must have been imported for the
[353] purpose, it is cruciform, with nave, choir and two transeptal aisles, the fabric being covered with carvings and sculptured panels. The
* 175 first mention of the building is made by Dean Monro, in his
346 account of his tour of the Western Isles, *c* 1549. In the first half

346
341

St Clement's Church, at Rodel, Harris

In the first half
* 175 of the sixteenth century it was extensively repaired by Alexander
346 MacLeod of Harris, who died in 1547 and whose remarkable
[764] tomb it houses. He prepared it nineteen years before he died; reckoned to be among the finest in Scotland, elaborately
[532] wrought, and with Latin inscription, nine sculptured panels cover the rear wall of the alcove, with the recumbent effigy of an armoured warrior with ornamented bascinet and camail lying below. Round-toed sabbatons cover the warrior's feet, which rest on a lizard-like beast, a lion standing guard at head and feet.

342 maintained—once an important aid to the survival
343 starved cattle. A slope from the dwelling-quarte
to the byre facilitates drainage: normally the lengt
[178] homestead follows the slope. The separation o
from byre took place in Harris and Uist over seven
ago by County Council decision, but in most of
even in 1947, about 40 per cent of the homestea
342 of the primitive type, outwardly but little changed
separate cottage, as in Harris, is a shapely little st
roughly symmetrical and particularly pleasing w
walls are whitewashed below the pale-gold thatch.

342 The surviving 'black house' is a stone structu
343 Stevens has written, "the rock of the island is
[314] work, and hard to win", and may be covered b
Undressed stones are collected and sometimes car
[324] long distances. Before dynamite came into use,
large stone could be broken up by lighting a peat
it, then dashing cold water over it. By an old
custom, the bachelors of a township used to help
the house for one of their friends who was about to
• [333] Lime for mortar being absent from the island, th
are built dry. The wall is double, the space b
being filled with earth. Hence it may be six fe
[364] at the base, though barely six feet high. Typical p
houses lacked windows, only a little light entering
the smoke vent and through a piece of oiled skin, r
latterly by a pane of glass let into the thatch of t
or by a deep window aperture in the wall.

342 Roof building is a difficult problem in const
343 on account of the scarcity of timber and the stre
the winds, and explains the narrow plan. Wood
313 scarce that when a house was abandoned the frame
[182] roof was removed, the spars being the tenant's;
[422]

342 adequate air-space, and windows opening at the top and
746 usually kept open by day, in which a woman can work at
178 ease. The Department of Agriculture aided the building
656 of a good standard type. The quality of joinery and
[335] masonry or concrete work improved, one fairly skilled
[333] workman usually directing the householder and friends as amateur builders. The cost of materials was met by a grant, generally of £250, half being repayable by an annual rent of £6 : 10s. for twenty years. Repayments proceeded satisfactorily. No scheme organised by the Department of Agriculture for Scotland won so general a commendation as this of house improvement. It made good use of family initiative and responsibility, with neighbourly co-operation not called for upon a large scale, a township at a time, but in quite a small, personal way. Nevertheless, had more guidance been provided to the builders, the
[464] houses could have been really well built. For lack of this, perhaps, crofters increasingly prefer to pay for skilled work, though helping actively. Appendces I (ii) and II (ii) gives pre-War and post-War statistics.

3. *The Township and its Changing Plan*

361 Where absence of rock and boulder permits ploughing,
[182] the village land is laid out in a series of parallel strips,
[491] aligned with the slope. The road runs either parallel with shore or river, or at right angles to it. The intermixed possession of strips by 'run-rig' characterised the Lowlands before the Enclosures, and is frequent in
[423] the Highlands and Isles. The apparent regularisation of field lines may conceal the fact that an individual holder's plots may be scattered amongst those of others in fixed
[182] run-rig. This is an advantage where quality of land is so patchy, and each man thus gets his share of good and bad

342 adequate air-space, and windows opening at the top and
746 usually kept open by day, in which a woman can work at
178 ease. The Department of Agriculture aided the building
656 of a good standard type. The quality of joinery and
[335] masonry or concrete work improved, one fairly skilled
[333] workman usually directing the householder and friends as amateur builders. The cost of materials was met by a grant, generally of £250, half being repayable by an annual rent of £6 : 10s. for twenty years. Repayments proceeded satisfactorily. No scheme organised by the Department of Agriculture for Scotland won so general a commendation as this of house improvement. It made good use of family initiative and responsibility, with neighbourly co-operation not called for upon a large scale, a township at a time, but in quite a small, personal way. Nevertheless, had more guidance been provided to the builders, the
[464] houses could have been really well built. For lack of this, perhaps, crofters increasingly prefer to pay for skilled work, though helping actively. Appendces I (ii) and II (ii) gives pre-War and post-War statistics.

288 434 The Harris Tweed industry has provided a higher standard of living, but income from this source is [458] inconsistent. The standards developed during prosperous [342] times cannot be met during difficult times. Many-roomed [336] houses with indoor plumbing are more heavily taxed than [661] smaller, less modern homes; loans must be repayed; [426] a car and a television once gotten are difficult to [145] give up. A weaver must pay for his insurance stamp, [651] which amounts to over L70 a year; and income tax takes a large percentage of a person's income, in large lump sums which are paid twice a year rather than in small amounts throughout the year. When income fluctuates, any constant demand for monetary outlay constitutes a liability.

654 181 To many persons outside the island concerned with Highland and Island development, Lewis has a reputation for "subsidy-grabbing." According to one official, "The people are too used to getting subsidies. They tend to sit back and rely on the subsidies, which makes it difficult to develop the place."

[829] "We pay tax," said one weaver. "Why not get back what we can in subsidy?"

651 434 Income tax collectors shake their heads in despair at the thought of trying to get a true estimate of a crofter's income, except for jobs such as weaving for

A HARRIS VIGNETTE

HARRIS'S OFFSHORE ISLANDS

Scarp

361 Until 1972 Scarp was the most westerly inhabited island in Scotland, separated from the Harris mainland by a strait which is about half a mile across at its narrowest, coursed by strong [133] tidal currents. The island is about three miles in diameter, rugged, especially in the north and west, with cliffs on all sides; 361 the maximum altitude is nearly 1,000 ft. On the east side lies a tiny marginal belt of good land, machar and soil; on this green 311 shelf, about one-third of a mile long, were all the crofts of the [134] Scarp settlement. Many stand deserted, and abandoned lazy-beds [241] in sites beyond the present settlement indicate a denser population at one time. The island's population-carrying capacity was severely limited by the minute amount of land available for tillage: of a total of about seven square miles only half a square mile can be used. Climatic conditions and soil type also restrict the range and quality of crops grown.

*175 Scarp was originally settled about 1810 and was occupied by 361 eight farming families who were reasonably comfortable. Not only did they have the island to themselves, but they had access to good pasturage on the Harris mainland opposite. About 1823 [166] thirteen small townships between the head of Loch Resort, Harris, and Bunabhainneader were cleared, some of the displaced families coming to Scarp. Some emigration back to Harris took place in the 1840s, but when about 1868 the proprietor divided Scarp into sixteen crofts instead of the previous eight holdings, these were further divided by the people themselves, trying to accommodate [162] their families and friends from elsewhere. In 1861 the population was 151; the peak was reached in 1881 with 213 persons. In 1951 it was 74. Communication with the Harris mainland is by boat, plying between two stone-built jetties.

433 The local economy was essentially a subsistence one, with self-241 sufficiency in such products as potatoes, turnips, cabbages, oats, 234 milk and fish. After a break of some years lobster-fishing has 226 recently been reinstated as an occupation. Oil lamps are the only lighting, though a few houses have piped water. The small shop

TRADE AND INDUSTRY

382 sent to several shipping ports, and the response was good; one
*175 Liverpool chandler even offered to take the whole output at a good price. But again the product was rendered useless, this time by being subjected to a partial-distillation process, in the thought that this would improve it; orders stopped. One shale-oil firm offered to take the crude peat tar to refine along with its own products for the purpose of modifying the flash-point of the oil it was itself manufacturing. Most commercial enterprises would have jumped at the chance of disposing of their output without the need for the always-tricky refining process, but here personal interests intervened and another avenue of profit was blocked.

The Lewis Chemical Works had by this time become something of a showpiece, chemists and scientists mecca-ing their way to Stornoway to see both plant and product. One eminent chemist pronounced the plant one of the most successful ever erected for the distillation of hydrocarbon oils from peat, and an Irishman said that if the Irish Peat Company's installation had been as successful as the Lewis counterpart, Ireland would have been enriched by her peat bogs. By the middle of the 1860s a ton of peat tar was being produced for 70s, as against 100s for unrefined shale oil. Peat oil sold at first at 2s 9d per gallon, then dropped to
[435] 2s 6d and finally to 2s, presumably as the American oil products were reaching the market. The writing was on the wall. Sir James Matheson, realising too late that perhaps a closer control should have been applied to the venture from the beginning, decided to cut his losses and close the works. All the metal—condensers, pumps, stills, pipes, and tanks—was broken up and sold for scrap. Nearly four miles of light railway had been laid from the Creed Works to the peat bogs; this was lifted for scrap. So ended the first phase of industrial Lewis. The venture proved, however, that with adequate skill and knowledge success could be grasped.

Bricks, printing, whisky

339 The brickworks which Matheson built for £6,000 at Garra-
*175 bost produced building materials and some fine examples of draining tiles, but has now disappeared. The Patent Slip built at
396 Stornoway for another £6,000 was able to take ships of up to
*175

[TEXT CONTINUED ON PAGE 127]

175 The new proprietor was no better placed than Seaforth to change the fundamental
429 causes of recurrent poverty and distress. But at least he had funds to ameliorate his tenants' lot and to allow experiments in land reclamation and industrial development.
233 Existing sheep farms were extended and others formed. Land reclamation went forward
319 hand in hand with industrial experiments such as distillation of paraffin from peat and brick and tile-making. A programme of road building was begun (the first roads beyond
359 Stornoway were begun in 1791, but there were only 45 miles of road by 1836). In Uig the
491 results were very obvious. Further clearances took place particularly from Timsgarry,
226 Carnish (21 tenants), Reef (22 tenants), Garynahine, Dun Carloway. The small tenants of Valtos and Kneep were only saved from eviction by the intervention of the Fisheries Board,
[162] for they were important places for white fishing. By the 1850's, although the population of Uig was more than double that in 1755, and 60% greater than in 1800, it was crowded
[66] into little more than half the area. Emigration enforced by clearances reduced the population of Bernera and South Uig by nearly 500 between 1851 and 1861.

175 No other part of Lewis saw so many farms; nowhere else did the small tenants suffer
429 so much from eviction. That was not all. Those who remained undisturbed were de-
311 prived of some of their traditional grazings and access to the rest was sometimes
233 restricted. Moreover they had to make room for many of the evicted families in their own townships, thereby further increasing the problem of congestion caused by the rapid
[161] natural increase of population. Thus, for example, about 1825 there had been 22 families
[162] in Valtos and Kneep. By about 1880 there were almost 100. But, during the same period these townships were deprived of their island grazings - Pabay, Vacsay, Floday and Wiay - formerly used for wintering cattle - and of part of their hill grazings (the traditional shielings). Use of the hill-grazings was restricted, too. Thus, for example, only one day was allowed to pull heather for ropes; if men were away fishing or for other reasons, could not attend on that day, they risked punishment by going on any other. Such stories could be multiplied many times.

[103] In the Bernera district, by the 1850's, only Tobson, Bosta and Breaclete (on the island) and Earshader and Crulivig (on the mainland) were left for the crofter families. Moreover their traditional summer grazings, which lay south east of the Deer Forest which was formed out of the Scaliscro sheep farm about 1850. Apparently their use of the old shielings was tolerated until 1878, after which date they were directed to the area north of the present road and which they have continued to use until the present day. Thus the shieling huts shown in fig.5 all post-date 1878; the area in which they lie may have been part of the West Earshader tacksman's holding. The date of discontinuance of that tack is not known but the house, now empty, was for long occupied by squatters and the old lazy beds around it still form part of a large squatter holding.

It is noteworthy that almost all the clearances were in the Bernera and South Uig districts and this is reflected in population changes between 1841 and 1851, shown in table 4.

The cleared areas included extensive hill and mountain grazings and some of the best wintering ground, including all the machairs except Valtos and Kneep. The East Loch Roag and Carloway districts were less attractive to the new farmers; as is so commonly the case in Lewis, their rough grazings lay on gently sloping low plateaux and were consequently ill-drained and of poor quality. About 1852 Dun Carloway was let as a tack but was never successfully farmed and was soon returned to crofter-occupation; it may never have been wholly cleared of crofters. Garynahine, at the southern end of East Loch Roag, next to Linshader, was also turned into a farm about 1852. Here the hill grazing was more extensive and, though seriously reduced by a crofter settlement scheme c. 1936, it remains

34

34 STRUCTURES--general statements describing several types of
tailed below. Only purely descriptive information on types of b
other structures, as well as data on materials and construction
under 33 will be filed here. The uses of each type of structure
under appropriate headings elsewhere.

178 241 476 of the normal capitalist farmer in the West; but in crofting areas, these practices reveal a strain between communal and individual tendencies.

a. Fencing:

233 [178] [419] [333] Although run-rig was replaced by fixed, compact holdings, the method of animal husbandry was not affected until the land began to be fenced. A single dry-stone dike enclosed the township, keeping livestock on the moor and away from the arable land. In different parts [184] of the Hebrides, various types of herdsmen were hired to protect both the livestock and the growing crops (cf. Owen 1958-59 for a discussion of cattle, calf and sheep herdsmen in North Uist).

175 625 The township Constable had a great deal of power, which included the right to evict people from their crofts, to enforce rules of good husbandry. The last Constable of Shawbost, who died at the turn of the century, has been credited with a number of ignoble actions, such as forcing an old woman with a sore leg to take her cow to the moor along with all the others. Old widows who had no one going to the fishing and hence no means of paying their rent might be evicted in favor of other persuasive, land-hungry members of the village.

The hills of North Harris. On the far side of the loch (West Loch Tarbert) can be seen the remains of the whaling station /p. 54/

175 342 361 the eighteenth century these 'black houses' would be replaced by houses of stone and lime, and a few of those survive.

172 174 712 Of the fort built by Cromwell on the Point, no signs remain. For tactical reasons, the best site would seem to be the neck of the Point, from which the guns of the fort could defend the houses, stores and quays. The irregular building line near the point marked T, a Town House at a later period, may correspond to the northern angle of the fort. The fort appears to have been standing when the original drawing was made for the engraving in the Old (or First) Statistical Account of Stornoway, *c.* 1793.

175 361 By the time Wood drew his plan in 1820, houses on the Point no longer looked exclusively on to the axial street. The main alinement of interest came to be the shore, marked by a properly built quay. Today, the Point Street houses have fallen into decay but many older houses still stand in fair repair along the 'Beach' or Quay.

175 361 34 Thirdly, from the nineteenth century, until 1914, two-storey, flatted tenements, hotels and houses of middle-class people were built upon a grid that followed upon the old field plans. In an alternative plan, proposed about 1820 but not adopted, a diagonal vista opened out to the Established Church, built in 1794 on rising ground. The modest Seaforth Lodge which had stood across the harbour was replaced in 1850 by Stornoway (or Lews) Castle, its pseudo-Tudor style designed to please the new improving landlord, Sir James Matheson, who had purchased Lewis in 1844. Presented to the people on the break-up of the Leverhulme Estates in 1925, a new technical school has taken it over. A few villas also grew up on outlying roads. Thus, a mere village in 1801, and among the smaller burghs

346 Linking the present day firmly with an ancient past is the probably fourteenth-century church of St Clement's, at Rodel. It is an outstanding building, and the only considerable architectural monument in the Western Isles. Built of rubble, dressed
[333] with schist, and freestone which must have been imported for the
[353] purpose, it is cruciform, with nave, choir and two transeptal aisles, the fabric being covered with carvings and sculptured panels. The
*175 first mention of the building is made by Dean Monro, in his
346 account of his tour of the Western Isles, *c* 1549. In the first half

346
• 341

St Clement's Church, at Rodel, Harris

In the first half
*175 of the sixteenth century it was extensively repaired by Alexander
346 MacLeod of Harris, who died in 1547 and whose remarkable
[764] tomb it houses. He prepared it nineteen years before he died; reckoned to be among the finest in Scotland, elaborately
[532] wrought, and with Latin inscription, nine sculptured panels cover the rear wall of the alcove, with the recumbent effigy of an armoured warrior with ornamented bascinet and camail lying below. Round-toed sabbatons cover the warrior's feet, which rest on a lizard-like beast, a lion standing guard at head and feet.

103 Stigh, the "town" at the "head" of the road "in" by the sea), Buailebhir (an area identified with the keeping of cattle), Gearraidh Mor, Creagan, Pluic, and Mach a Chul ("out the back," by a road built relatively recently). A street which leaves the main road and cuts into the moor, or common grazing land, is called Grinnbhat, from the name of a nearby loch.

511 The presence of a large Harris Tweed mill in
[348] Shawbost has contributed to a high standard of living
[288] within the village. It is estimated that only 25% of
[493] the households of rural Lewis have cars; about 50% of the households in Shawbost possess them. In 1970
[342] Shawbost had only one occupied tigh dubh, or "black house" built of dry stone and roofed with thatch, which to many islanders symbolizes a past life of poverty and
[404] adverse times. Modern appliances such as refrigerators,
[251] deep freezers and electric toasters are common in
[207] Shawbost. Most homes also have television sets, and
[206] many have telephones.

288 The mill in Shawbost employs between 60 and 70
463 persons to dye, card and spin yarn, to prepare the yarn in warps which are then delivered to weavers who work in their own homes, and to darn, wash and market the

288 finished lengths of tweed. For a tweed to be classified
463 as "Harris Tweed," it must be hand-woven by Outer
[424] Hebrideans in their own homes, but the weavers are
288 essentially employees of the mill. All the large Harris Tweed mills in Lewis, except the one in Shawbost, are located in Stornoway. A few smaller businesses, which design and market tweeds but have no elaborate machinery to process the tweed further, are scattered throughout the island.

621 The village of Shawbost is composed of 169 households,
162 of which 110 are headed by "crofters," persons recognized
[427] as legal tenants of a croft. Of the remaining 59
[361] households, 16 rent houses which were built and are maintained by the County (called "council houses"), 11 have erected houses on the crofts of relatives, and
463 32 have built homes on the common grazing lands. Non-
241 crofters participate in the agricultural activities of the township. It would not be unusual, for example, for a non-crofter to serve as the clerk of a grazings committee.

●342 In North Shawbost, one croft house and two non-
166 croft houses are used only when the owner returns to Shawbost from the mainland for a holiday. The school-
[875] master lives in a house adjoining the school, and the
[793] minister in a manse located between Shawbost and the neighboring village of Bragar.

233 were taken out to small huts in the central moorlands
233 for several months during the summer. These moorland
●342 dwellings, called sheilings or airidh, were tiny stone structures, as small as seven by five feet. They had double stone walls filled with clay, and a rounded thatched roof. There were two doors opposite each other in the longer walls, one of which was filled with turf depending on the direction of the wind. A fireplace
[354] was built into one end of the hut; shelves in the stone
[352] walls held basins of milk and other items; and the major part of the sheiling constituted a grass-and-heather-lined cavity which served as a bed. The sheilings were usually
[361] clustered together near a stream, duplicating neighborhoods within the village.

221 Ploughing and planting were finished in the spring before the young men and women went off to the fishing, and before the cattle were taken to the sheiling. Some families went to the sheiling as early as March for a "fresh bite" of grass. Many went out in the middle of May, and returned at the end of July or beginning of August.

233 "During the week, young girls or boys stayed out on
857 the sheilings, depending on who was available in the
887 family; maybe old people who couldn't do anything else,
462

178 The number of cattle diminished as milk became
231 available by other means; and when the township reseeding
234 schemes came into existence, the need to go to the
233 sheilings for an "early bite" was removed. The sheilings
178 that remain in use today are huts of tin, wood and
●342 concrete within easy walking distance from the highway, used on weekends and during summer holidays. Most of these modern sheilings are close to Stornoway, and serve as summer retreats for the relatively harried urban
[184] dwellers such as publicans. On the west side, the sheilings are no longer used, but remain as a theme of songs and in nostalgic memories.

C. The Loom

175 Clo Mor, the big cloth, was woven in the Highlands
286 and Islands for hundreds of years. Martin Martin, who travelled through the Outer Hebrides in the late 17th century, describes the export of "plaiding," and the practice of waulking or shrinking the woven length of cloth (Martin 1716). Weaving was done on wooden looms, and produced only for local markets until the middle of the 19th century.

[731] By the middle of the 19th century, the failure of
[735] the kelp industry, decline of fishing, and destruction

175 Whatever the rationalization, cobbler fathers begot
829 cobbler sons. The present postmaster's grandfather was
463 the first postmaster in Shawbost, and when help is needed
[205] in delivering the mail it is the postmaster's first
[767] cousins who are likely to help out. As late as the 1950's, the township still had its own undertaker, a man who had learned from his father the art of laying out and dressing the body but who didn't like the job very much and was happy enough to turn it over to an undertaker who traveled from Stornoway.

463 The island has had a veterinarian, based in Stornoway,
[232] for the past 30 years or so. Earlier, certain blacksmiths and farmers treated ailing livestock when the crofters
[278] needed them. For human ailments, there were many cures
[755] by plant and spell.

463 The man who was the last village blacksmith died
326 not long ago. His smithy was in the center of the village.
[342] His home and smithy were mortared stone buildings with corrugated iron roofs that were once estate houses for the men who worked the experimental farm established by Sir James Matheson in what is now New Shawbost. The blacksmith was also a shopkeeper and butcher. As a
463 blacksmith, his work was principally shoeing horses and
326 making harrows and peat-cutters, which he did with the
874 aid of one and sometimes two apprentices. One of his

585 on these occasions. At some point during the night the bride and groom were prepared for their wedding night together. The bride's female companions undressed her, prepared her for bed, and put her into the bed with a hot water bottle. She shared some sherry with them, and they went out, whereupon the groom was brought in by his male companions. After much joking the couple were left together.

[574] On the third night, a dinner was given for the older persons who had not been able to come to the "big" wedding.

[293] For some time after the wedding, the married couple
[431] visited relatives and neighbors who had been unable to come to the wedding, taking a bottle of whiskey with them.

585 House weddings declined in number during the war when
178 food was rationed, and as more persons changed from the
[342] "black house" to the less easily cleaned and more
[485] elaborately furnished "white house." Most weddings are now held in hotels, and consist of a single wedding dinner and dance; they are often held on Thursdays, the day of the banais in the past. The emphasis on community participation still exists: even though the practice of holding hotel weddings has limited the number of guests, an effort is made to invite someone from each household in the neighborhood. In part to avoid disappointing the

121 being determined by conditions of culture, such as
121 political and economic conditions. Under conditions
178 of gradual centralization of economic and political
182 systems, the geographically marginal crofting areas have evolved strategies, some of which puzzle agencies concerned with development or other aspects of governmental process.

178 Before the North of Scotland Hydro-Electric Board
365 began to operate in the crofting counties, not more
511 than one croft in every hundred had electricity; but by the end of 1951, one in every six holdings had been supplied (Taylor 1954: 20). "The light" came to
[354] Shawbost in 1951. Before then, the islanders used
[199] Tilley lamps, a Canadian invention; and before then,
[312] double-wick paraffin lamps. Piped water came a few
[464] years later, around 1955; it was brought from a nearb loch, and the construction work gave temporary jobs to local people. The availability of these services
[344] facilitated the building of county council houses,
[342] which many welcomed as providing a relief to the congestion caused in part by rules against building more than one house on a croft. But, paradoxically,
[651] with larger, better homes and all these services came a decrease in the advantages of living in a crofting township: property was assessed and people began pay rates or taxes.

288 The Harris Tweed industry has provided a higher
434 standard of living, but income from this source is
[458] inconsistent. The standards developed during prosper
[342] times cannot be met during difficult times. Many-roo
[336] houses with indoor plumbing are more heavily taxed th
[661] smaller, less modern homes; loans must be repayed;
[426] a car and a television once gotten are difficult to
[945] give up. A weaver must pay for his insurance stamp,
[651] which amounts to over L70 a year; and income tax tak
a large percentage of a person's income, in large lum
sums which are paid twice a year rather than in small
amounts throughout the year. When income fluctuates,
any constant demand for monetary outlay constitutes a
liability.

654 To many persons outside the island concerned wit
181 Highland and Island development, Lewis has a reputati
for "subsidy-grabbing." According to one official,
"The people are too used to getting subsidies. They
tend to sit back and rely on the subsidies, which
makes it difficult to develop the place."

[829] "We pay tax," said one weaver. "Why not get bac
what we can in subsidy?"

651 Income tax collectors shake their heads in despa
434 at the thought of trying to get a true estimate of a
crofter's income, except for jobs such as weaving for

CHAPTER III

THE ISLAND HOME: HOMESTEAD, TOWNSHIP AND BURGH, AND THEIR POPULATION

(A) THE LEWIS HOMESTEAD AND THE TOWNSHIP

1. *The Black House*

342
343

THE 'black house' of Lewis proper contains within four walls—or rather its one continuous wall—both men and animals (Fig. 10(A)). It is the simplest surviving homestead in Western Europe. The basis of its plan, with its threefold division—for animals, for living, and for sleep—makes it not merely a house but a home and steading in one, a single homestead. The basis of its plan is still found on many a Scottish croft, and Burns' cottage was built as "byre, but and ben"—a cowshed, a room 'without' and a room 'within'. In isolated cases in the Lews, however, the partitions are still low; so that one could sit on a stool by the mid-floor fire and see mother and babe, and behind them cow and calf. The scene recalls a painting of the Holy Family, but whereas Joseph the Carpenter felt his wife hard-pressed when they took refuge beside ox and ass, this primitive homestead with its quietly borne hardships has been the rule in rural Lewis until well after 1919.

[353]

As men and animals share the same roof, warmth is

maintained—once an important aid to the survival of half-starved cattle. A slope from the dwelling-quarters down to the byre facilitates drainage: normally the length of the homestead follows the slope. The separation of house from byre took place in Harris and Uist over seventy years ago by County Council decision, but in most of Lewis, even in 1947, about 40 per cent of the homesteads were of the primitive type, outwardly but little changed. This separate cottage, as in Harris, is a shapely little structure, roughly symmetrical and particularly pleasing when the walls are whitewashed below the pale-gold thatch.

The surviving 'black house' is a stone structure. As Stevens has written, "the rock of the island is hard to work, and hard to win", and may be covered by peat. Undressed stones are collected and sometimes carried for long distances. Before dynamite came into use, a very large stone could be broken up by lighting a peat fire on it, then dashing cold water over it. By an old Gaelic custom, the bachelors of a township used to help to build the house for one of their friends who was about to marry. Lime for mortar being absent from the island, the walls are built dry. The wall is double, the space between being filled with earth. Hence it may be six feet thick at the base, though barely six feet high. Typical primitive houses lacked windows, only a little light entering through the smoke vent and through a piece of oiled skin, replaced latterly by a pane of glass let into the thatch of the roof or by a deep window aperture in the wall.

Roof building is a difficult problem in construction, on account of the scarcity of timber and the strength of the winds, and explains the narrow plan. Wood was so scarce that when a house was abandoned the frame of the roof was removed, the spars being the tenant's; but in

g, 73 per cent have the language, which has been introduced y immigrant country folk and their descendants.

HEALTH AND HOUSING

Despite the harsh conditions of centuries, the physical health of the island was good in early times. Epidemics were rare due to olation, though on occasion smallpox carried away many children. The commonest diseases were fevers, jaundice, dysentery and iarrhoea. Bloodletting (as in many another more advanced community) was the usual cure for fevers and dysentery. For coughs the people took a 'brochan' or soup of roots of nettles and reeds boiled in water with yeast; the meal of a black bean, mixed with boiled milk, was a useful cure for dysentery. Reports describe the olk as being well-proportioned, free from bodily imperfections and of good stature; healthful and strong-bodied.

But privations, particularly the frequent recurrences of near-amine, coupled with the primitive housing conditions, began to ake their toll. The increasing sickness rate aroused the concern of authority. The most primitive dwellings had but one room, with the cattle at one end and the family at the other. In 1830 Seaforth sought at least to put an end to this, ordering that a partition must be erected between beast and man, 'and that more light should be admitted into the dark recesses of their habitation'. This type of one-room dwelling was not confined to the island, being found with many variants throughout the Highlands and Islands area. The old Lewis house was, as a rule, an oblong structure, varying in length according to the means and requirements of the occupier. It had but one door, and frequently had no windows. Chimneys did not find favour, mainly because any opening for the escape of smoke from the centrally-sited hearth tended to reduce the quality of soot produced; and soot was regarded as a valuable manurial product. If there was a hole in the roof to admit some light, a small pane of glass was fixed into it: this soon had a coating of soot, and the sole source of light was the doorway—when the door was open. The family and the cattle used the same entrance; and the cows' dung was removed once a year in the springtime.

PLAN

Hebridean type of 'black house': plan and cross-section

In 1899, the Medical Officer of Health for the Parish of Barvas described the typical Lewis crofter's house of the time. It had three apartments, two for the family, and a third for the cattle; this new arrangement was the result of the Regulations issued by Sir James Matheson for the betterment of the estate. The low thick walls were built of stone, or stone and turf, with a packing of loose earth, and were perennially damp. The roof, composed of a framework of wooden rafters and couples resting on the inner edge of these walls, was covered over with turf divots and straw, bound with ropes of straw, heather or coarse thatching rope, and weighted down with stones. It was never air- or water-tight, and roof water usually soaked into the packing of the walls and thus oozed into the house. Further, only the slightest attention was given to situation and drainage. The floor of the dwelling apartment was composed of a pavement of rough stones covered over with clay—and a cold damp floor it was. The cattle apartment had no pavement, so that the manure liquids and slop water percolated into the ground and at times found their way into neighbouring dwelling houses and even into the drinking wells. Many of the houses were built back-to-back and sometimes in rows three deep. Lighting was deficient and the windows, fixed either in walls or roof, were not made to open.

Some houses had round portholes in the roof at the top of the wall which might be opened or closed at pleasure; these served for lighting and ventilation at the byre end of the house, though occasionally they were present also at the living end. Draughts coming in through the roof and walls, and the blazing peat fire in the centre of the middle apartment, helped to keep the air in motion, but the smoke from the fire frequently filled the upper portions of the room and, there still being no chimney or other outlet as a rule, it pervaded the whole atmosphere of the house. From a sanitary point of view such houses had the gravest of defects: it amazed visiting doctors that infectious diseases were ever absent. Yet generally the inmates compared well in physique, general well-being and immunity from serious disease with those more favourably situated. Tuberculosis was the most prevalent enemy.

In 1879, improving leases were offered to those who were will-

[TEXT CONTINUED ON PAGE 145]

ing to put their houses into better condition. The leases required, *inter alia*, that the thatch was not to be stripped off or removed for manurial purposes; that the byre was to be a separate building; and that the dung was to be removed regularly to a distant dung-heap. A Sanitary Inspector's Report for 1896 noted that the new houses being erected were following the old traditional patterns. And though the introduction of statutory requirements did bring real improvements, as late as 1902 it was reported: 'The insanitary houses and the impure water to which the people have long been accustomed, would lead an enquirer to expect a high death-rate. That is not so, however. The island is occasionally visited by epidemics of measles, or whooping-cough, like other parts of the country; and there are sometimes outbreaks of dung-fever—a preventable malady—but altogether the general health is good."

The Sanitary Inspector's Report for 1898 described certain water supplies in the island as 'little better than cesspools for surface soakings'. And five years earlier the water supply of Cromore was 'merely a few holes dug out amongst the arable land next to the houses; and polluted with the manure dissoved off their arable ground; and in some cases contaminated with liquid sewage percolating through the soil from their houses.' In 1893 an outbreak of typhoid fever in some townships in Uig was traced to the contaminated stream whose water was used as a drinking-water supply. Improvements in the water supplies were eventually put into effect, with a marked decrease in the ailments which the people had come to expect as normal to their way of life.

The rate of infant mortality was high. The weaklings died young. Only the strong survived to withstand the insanitary surroundings. A peculiar form of disease was associated with the island: it seized a child about the fifth night after its birth and was consequently called the 'fifth night's sickness'. According to medical opinion this was infant lockjaw *(tetanus neonatorum)*. The doctor of Lochs in 1892 reported that it was common among the infants of his parish, being 'most frequently met with in those dwelling houses where sanitation in its most rudimentary form is entirely ignored; where we have to walk to the fireplace in the

Though the island is but a great lump of rock, Dean Monro says that in his time an abundance of corn was grown, by delving only, and an abundance of clover-grass for sheep. The island also produced a fine bere-meal which the islanders stuffed into the skins of sheep and sent, as their rent or tribute, to MacLeod of Lewis, along with mutton and fowls.

Of St Ronan's Chapel, still to be seen and reckoned the oldest Christian building in Britain remaining in its original state, Monro says: 'As the ancients of the country allege, they leave a spade and a shuil [shovel] when any man dies, and upon the morrow find the place of the grave marked with a spade, as they allege.' In 1695 Martin wrote of Rona in 1680:

> The people repeat the Lord's Prayer, Creed, and the Ten Commandments in the Chapel every Sunday morning. They have cows, sheep, barley, oats, and live a harmless life, being perfectly ignorant of most of those vices that abound in the world. They know nothing of money or gold, having no occasion for either; they neither sell nor buy, but only barter for such little things as they want; they covet no wealth, being fully content and satisfied with food and raiment; though at the same time they are very precise in the matter of property among themselves; for none of them will by any means allow his neighbour to fish within his property . . . They concern not themselves about the rest of mankind except the inhabitants in the north part of Lewis. They take their surname from the colour of the sky, rainbow, and clouds. There are only five families in this small island, and every tenant has his dwelling-house, a barn, a house where their best effects are preserved, a house for their cattle, and a porch on each side to keep off the rain or snow. Their houses are built with stone and thatched with straw . . . When any one of them comes to Lewis, which is seldom, they are astonished to see so many people.

Then came tragedy. Somehow, probably off a wreck, a swarm of rats landed on the island and consumed virtually all the food. A few months later, some seamen landed and robbed the islanders of their only bull. 'These misfortunes and the want of supply from Lewis for the space of a year occasioned the death of all that ancient race of people.' Some years afterwards a new colony was sent to the island. In 1796, at the time of the *Old Statistical*

even to the extent that the St Kildans used their observations of the flights of birds both as compass and as omen for good or evil. Martin speaks of the islands with amusement and admiration. He indicates that the community was backward in some ways: they were illiterate, and wondered naïvely at the newcomers and their manners. 'The inhabitants of St Kilda are much happier than the generality of mankind, as being the almost only people in the world who feel the sweetness of true liberty.'

In May 1877, when the local tourist trade had hardly started, HMS *Flirt* sailed from Greenock with food to relieve hardship among the St Kildans, and an officer of the Highland & Island Agricultural Society on board reported that 'Tobacco was what they invariably asked for'. The ordinary diet of the island consisted of, for breakfast, porridge and milk; for dinner, potatoes and the flesh of fulmar, or mutton and, occasionally, fish; for supper, porridge when meal was plentiful. Seabirds' eggs, from March onwards, also formed a staple food. Tea was taken once or twice a week and the islanders were reported to be 'rather fond of it'. There were eighteen inhabited houses, sixteen of which had zinc roofs, two being thatched huts. The sixteen new cottages had been erected about 1863, 'and are certainly much superior to the inhabitations of the same class of tenants anywhere in the Western Isles'. All were well furnished, peat was used for fuel and there were two watches and one clock on the island. There were some seventy-five islanders; most of the men were old, and only two of them were unmarried, with twelve spinsters still to choose from. All read the Gaelic Bible. The men were mostly tailors, shoemakers and weavers; every house had a loom. They made all their own clothing, the men also making the women's dresses, and a good deal of blanketing and tweed cloth was made and sold. Nearly every house had a spinning wheel and a large pot in which the yarn was dyed. The women were expert knitters. Each croft and house was rented at £2 annually, sheep being charged for at the rate of 9d per head; these charges were usually paid in kind.

Feathers of the sea fowl formed the principal export of the island. The factor paid 6s per stone of 24 lb for black feathers; and 5s per stone for grey. For these he received, in Edinburgh or

(1) Stornoway stretches from the town north to Tolsta;
632 (2) Barvas from the north of the Island southwards, past Barvas village (WNW. of Stornoway) five miles further to Bragar;
(3) Uig covers the rest of the south-west coast; and
(4) Lochs, the remainder of the south-east coast.

131 Seen from the sea, the Island chiefly presents dark,
133 gneissic, heath-fringed cliffs whose steep walls become gentle slopes towards the south as we enter the bays, sea lochs and firths which run far inland (Plates I to IV). As one sails northward along the east coast of Lewis, there are few hills to be seen, and these are below 1000 feet; most of the island is rolling moor, rarely rising above 300 feet. Here and there new houses stand out, the 'white houses' (*tighean geala*), which, however, are usually grey
342 or even dark in colour. These dwellings have generally been stone-built and were often slate-roofed; asbestos roofs are now common. Yet even when dark, these new cottages are conspicuous beside the low 'black houses' with their rounded forms of wall and roof, and with thatch overspread by a faint haze of blue peat reek, like the bloom
133 upon a fruit. Their plots of corn, though each may be so
[243] tiny as to appear but a spot at a distance, together form a bright patch against the dark brown moor. In the sketch which forms the Key to the Map of Vegetation and Settlements (Fig. 8), an attempt has been made to bring the map and the landscape alive to the mind's eye, from the hills of North Harris north-eastward to the Butt of Lewis.

131 Turning the north cape of Lewis, 'the Butt', and sailing
133 southwards along the west coast, we see hills increasing in height in the Uig district, rising to those of Harris with

PLATE XI. AIR VIEW OVER STORNOWAY HARBOUR, LOOKING SOUTH TO HARRIS

The original central street of the Point can be seen (cf. Plate II and Fig. 13). The woods of Lews Castle lie across the Bay, with Arnish Moor beyond

/facing p. 92/

later times the landlord might supply timber. Long ago a main source of timber was the shore. The length of the house may be fifty to sixty feet, and the inside breadth ten to twelve feet, spanned by ten or a dozen pairs of couples on which are laid transverse 'cabers', which may be tree trunks, branches, odd wood, old oars, or, exceptionally, sawn timber. The tops of the walls are finished with turf, to keep the filling from being washed out, and to provide a smooth bearing for the couples, the ends of which are pushed into the turf so as to bear on the inner half of the wall; the rounded form and absence of overhanging eaves prevent a gale obtaining purchase on the roof, but a gable with chimney is now usual on the end wall of the inner room. The rafters are annually covered with turf, and the roof is thatched with thin, short barley straw, which was pulled up, not cut, after the ears were picked off, the roots gripping well, and the stem hanging outward and down.

The door gives direct access to the byre (*bathach*), through which one reaches the middle part, or living-room, 'at the fire' (*aig an teine*), from which there opens the inmost part, the 'room' with bed-closets. There is no ceiling to the primitive house, the row of box beds having tops to keep off the drips of rain water. In the middle of the earthen, sanded floor of the living-room is the circular hearth, built of stones with clay between, and raised a few inches, with no chimney.

In the byre, the manure accumulates from spring to spring, and a breach is made in the end of the house for the annual removal of the manure. There are no privies. Where there is fodder and straw in any quantity a barn is added. Stacks are rare because of wind. A low wall, continuous with the house and barn, may enclose the kale-

yard and occasionally a barley-kiln in which to dry grain before malting it for home-brewed beer. A 'black mill', with its primitive horizontal water-wheel, stands apart by some burnside.

Round the circular hearth, a large company can assemble in very social fashion for talk, story and song, the meeting *together* (*ceilidh*). By the transfer of the hearth from the centre and the substitution of a gable fireplace and regular chimney, the social circle is halved, while meantime the tales of the *ceilidh* are forbidden or forgotten. Happily the bench still stands against the wall, near to the open door, through which neighbours slip in with a word of greeting to find a customary welcome.

The dwellings on the summer pastures out on the moors show great variety, illustrated in Fig. 10(B). A simple type in use is built of turf and stones, lightly roofed with turf placed on spars. A more primitive 'beehive' type (which fell out of use before 1900) was stone-built and corbelled, probably for lack of timber. And whereas the lighter type always stands by itself, the corbelled type was added to until a dozen cells formed a single mass, suggestive of ancient 'neolithic' hamlets as at Skara Brae in Orkney, described by Childe, and of the domed, corbelled huts of the ancient East.

A further type was the 'spring house' of Tolsta, NE. Lewis, in which both cattle and folk sheltered in spring a little way from the village, before going out to the more distant moor. Mr. Donald Macdonald, F.R.S.G.S., a native of Tolsta, informs me that the spring house was in use until 1936. He remembers vividly how life in the shieling restored health and colour after the winter.

2. From Black House to White House

Discontent with the old black house grew wit knowledge and experience of better housing in Stor and on the mainland. The congestion which deve during the nineteenth century meant that often one was fouled by another above it, leading to typhoi demics. While the smoky atmosphere of the houses' inflamed the eyes and irritated the respi system, the roof was high and the fire kept the motion by day, ventilating it to the chimney hole, the lack of glass often made it necessary to work wi door open. The ravages of tuberculosis came towar end of the nineteenth century, when Islanders went crowded towns and, not being immunised, were da ously infected. Returning home, too often to linge die in a house now provided with tiny, fixed panes permitted a closed door and made it stuffier than b patients spread infection. Flight to a tiny, air wooden cabin or to a small white house of stone an often followed. The availability for the first time of and timber, a certain practice in boat-repairing, an sibly acquaintance at first- or second-hand with Ca wooden houses, may have influenced the choice of The early 'white' houses, with an attic lit by sk were airtight, for the windows were too often fixed o opened at the bottom. The door was left open in weather, but it was not high enough to allow the of the stale, upper layer of air which the women br as they did their cooking and baking.

In the inter-war period, particularly in its last d the 'black house' was being abandoned, not for som worse, but far better. The Government-aided house

adequate air-space, and windows opening at the top and usually kept open by day, in which a woman can work at ease. The Department of Agriculture aided the building of a good standard type. The quality of joinery and masonry or concrete work improved, one fairly skilled workman usually directing the householder and friends as amateur builders. The cost of materials was met by a grant, generally of £250, half being repayable by an annual rent of £6 : 10s. for twenty years. Repayments proceeded satisfactorily. No scheme organised by the Department of Agriculture for Scotland won so general a commendation as this of house improvement. It made good use of family initiative and responsibility, with neighbourly co-operation not called for upon a large scale, a township at a time, but in quite a small, personal way. Nevertheless, had more guidance been provided to the builders, the houses could have been really well built. For lack of this, perhaps, crofters increasingly prefer to pay for skilled work, though helping actively. Appendces I (ii) and II (ii) gives pre-War and post-War statistics.

3. *The Township and its Changing Plan*

Where absence of rock and boulder permits ploughing, the village land is laid out in a series of parallel strips, aligned with the slope. The road runs either parallel with shore or river, or at right angles to it. The intermixed possession of strips by 'run-rig' characterised the Lowlands before the Enclosures, and is frequent in the Highlands and Isles. The apparent regularisation of field lines may conceal the fact that an individual holder's plots may be scattered amongst those of others in fixed run-rig. This is an advantage where quality of land is so patchy, and each man thus gets his share of good and bad

in solid black, and the third in hatching (Fig. 11). First, upon the little peninsula or 'Point' which protects the inner fishing harbour of the river there grew the nucleus of the town, with its Castle upon the rocky islet now concealed by the steamer pier. Sheltered from the waves by the peninsula and from enemies by the Castle, MacLeod's galleys and the early fishing fleet must have congregated in the inner harbour. Protection from storm was specially needed until, in the nineteenth century, a quay was built, with space for marketing and handling the herring.

Inland from the Castle was the little church of the burgh, dedicated to Saint Lennan (L). The little town can be imagined stretching inland from the church, its dwellings built along the 'Point Street' axis, until it met the track, road or street crossing the neck of the Point. The largest church of Lewis proper, now in ruins, stood apart from the burgh, at the south-west extremity of Eye Peninsula. Until trade developed, the backs of the houses would have been turned to the shore. To north, on the landward side from which cattle would come, the market developed.

Secondly, in the seventeenth century, thatched houses were strung out along Point Street and the shore for the Gaelic settlers, the fisher- and craftsman-crofters brought here to found a burgh and commercialise fishing. During

361 it command and make it the leading settlement of the
366 Hebrides, with a population fluctuating around 5000.[1]
162

2. Aspects and Problems of the Burgh

361 The little town pleases by its views over the harbours,
632 outer or inner—sheltering perhaps a steamer or two and the clustered fishing vessels—across to the wooded skyline and the beautiful grounds of the Castle, a-flower in spring with rhododendrons. Or framed in trees from the Castle policies, the harbour and even the roofs and
• [342] smoke of the houses are not unpleasing (Plate II). But the town's chief charm is its setting, not itself, though its plain dwellings with 'harled' or rough-cast walls and slate
[146] roofs are simple and inoffensive. In rehousing, the Local
[656] Authority had respected Scottish domestic features. But the greater use of local materials, labour and skill is surely desirable in the Island with its many half-employed men, who need such work to maintain income, health and morale.
[362] As is to be expected in view of low incomes, and the extremely primitive housing in the country, urban housing
[162] is inadequate. In Stornoway burgh in 1931, 44 per cent, or nearly half the population, still dwelt in houses of one to three rooms, 17 per cent in four (including attics often with no dormer windows), 20 per cent in five or six, and 18 per cent in seven rooms and over. There has been improvement up to 1939, and after 1945, but much remains to be done.

369 Turning to cultural life, profound differences divide
632 the town from the country about it. Whereas in the townships of rural Lewis the people are almost purely natives

[1] The burghal area was extended in 1935. At the census of 1951 its population stood at 4950. This showed an increase of 15·9 per cent above the population enumerated in the same area in 1931.

623 The Trustees of the Stornoway Trust have not found
423 it easy to meet the cost of keeping up the valuable property
427 of the Castle and Park, nor to carry the burden of its rates, no adequate income being available for the purpose.
178 Today, however, Leverhulme's gift is being put to good
874 use as a Technical College, opened in September 1952.

Division of the available farms, after providing about
311 200 small crofts (of ten acres or so), still left the problem
427 of finding legal homes on legal tenure for the remaining cottars and squatters.[1] The Department of Agriculture
362 arranged to feu plots of 'skinned land' on the outrun of
656 certain townships, including one in the extreme north and others in Lochs. About 200 of these little holdings with potato ground were provided. On the holders' behalf the Department feued land from the owner, after obtaining the consent of the Common Grazings Committee of the township and permission from the Land Court for 'resumption', *i.e.* for enclosure of a portion of the common. The legal and administrative procedure involved may seem disproportionate to the economic value of the holdings. Yet difficulties of law and custom had been allowed to go from bad to worse during the past eighty years; and these difficulties were overcome.

362 To encourage better housing in the crofting counties,
657 loans are made to 'crofters and fishermen feuars' person-
• [342] ally. Local stone, or latterly concrete, is used, and much of the building is done by the 'man of the house' himself, and his friends. From 1920 to 1940, nearly 1200 loans were made in Lewis and Harris for the erection (or improvement) of houses, and in a few cases for the erection

[162] [1] Estimated at 1200 to 1500 shortly before, the open question was whether subdivision during the previous eighty years was to be recognised and accepted.

231 summer, were last used for cattle six to eight years ago by people in Brenish, but none are in use today. These shielings were at the western foot of Mealisval, only about a mile from the township. The Brenish 'distant' shellings, about six miles to the south-east of the township across the mountains, were not used after about 1920, while the adjoining Islivig shellings were last used in 1922. Mangersta may have had its original shielings to the east of Loch Melavat about a mile south of the township, but after obtaining the enlargement from Mealasta farm, until about 1939, shellings were used in that area.

314 No peats are cut on the crofts; the peat-cutting areas for all three townships are near
241 the road and in no case far from the township. The common pasture near the crofts bears evidence of former cultivation, but it is at least fifty years ago since crops were grown on it. At this time the townships of Islivig and Brenish were over-populated with many cottars living on the crofts and all possible land on the crofts was already under cultivation. Today, less than half this 'old arable' is being cultivated, and in several cases the land is used solely for hay and grazing.

• 342 There are now no thatched houses inhabited in the townships and most houses have
312 kitchen and other extensions added. Some crofters have built concrete two-storey byres of modern design. In Brenish, where the hills to the east provide a good catchment area and the Brenish river a good source of supply, all the crofts have their own private piped water supplies, while in Islivig and Mangersta most crofts now have, or are getting, a
377 water supply. All croft houses are supplied with electricity from the grid.

226 Commercial fishing has long ceased and as there are only three boats there is now very
301 little fishing for domestic use, the principal use of the boats being to ferry sheep to the
280 off-shore islands. Weaving is an important occupation. There are seventeen weavers - nine in Brenish, two in Islivig and six in Mangersta, and during 1959 they were kept busy;
446 in 1958, however, few orders were received. Weaving cannot be said to bring in a steady
[334] income here, and some of the weavers, and others, find additional employment outside the township - this includes four men at the hydro-electric scheme at Gisla, three at Mangersta Ministry of Civil Aviation station, three at Aird R.A.F. station and at least
[407] one in the Glen Valtos quarries. In addition, one man owns a tractor which he hires
[242] out, and one, owning a lorry and van, does haulage work. Altogether, out of a total of twenty-seven men under sixty-five who do work, all but three (one just out of school and one a semi-invalid) have other employment in addition to their crofts.

162 The total population for the three townships is one hundred and twenty-one residents, and fourteen permanently away from home. Of the residents, twenty-eight (or 23%) are children of, or below, school age, forty-seven (39%) are in the 15 - 45 age group, 15 (12%) are in the 45 - 65 age group, and 31 (26%) are over 65. Of the resident tenants, thirteen are over 65, twelve under 45, and five between 45 and 65.

181 The relatively young population may help to account, together with the better soils, for this area giving an impression of a fairly prosperous crofting district compared with some of the others in Uig. Amalgamation of crofts into larger units has also gone further. The use of a tractor or horse for ploughing, extensive use of artificial fertilisers, the sowing of grass seeds and the sale of sheep for meat, all seem evidence of a group of people who are determined to make the most of their limited resources.

233 One enterprise, that of the Aird Bheag sheep farm, deserves special mention. Four crofters (three from Brenish and one from Islivig) have purchased from the Uig shooting estate about 2,000 acres of land on the Aird Bheag and Aird Moire peninsulas, five miles south of Mealasta. Here they are running a flock of about five hundred sheep. There is

133 The 1,700 acres of common pasture stretch to the east and west of the crofts, across
231 the peninsula which terminates in Gallan Head, extending to those of Crowlista and Valtos
654 in the south. The whole coast is broken and rocky, the land inland is peaty, and Aird lacks the advantages of the machair land found further west. To the north of the village there is now an R.A.F. radar station on Rudha Caol, built on what was part of the common pasture. It dominates the landscape and makes a considerable difference to the life of the inhabitants.

341 The township, though isolated, is reached by a good road which leaves the main road
491 at the western end of Glen Valtos. Grocery vans call on Wednesday and Friday, a
493 butcher's van on Saturday, and the local people are also allowed to shop at the N.A.A.F.I. within the Camp. The road through the village approximately follows the line of the 100 ft. contour and all the houses are built directly on to the road, with byres, weaving sheds and other buildings behind, whilst in most cases hens are kept on the steeper slopes below
[205] the road. Thus the settlement has far more of the appearance of an English village than
[342] have most crofting townships, but there is no shop or post office. The majority of the houses are stone with slate roofs and fairly large, though some of them have been built for
[354] more than fifty years. All have electric light and their own water supply and several have
[312] modern byres.

427 There are ten crofts, as the enlargement of one of the original nine was subsequently
311 split off to make a separate croft. Of these, one tenant is an absentee and another an elderly woman who does no cultivation. In both these cases, grazing is let to others so
[447] that there are actually eight operative units. The crofts are fenced in their upper portions, but in most cases the fencing does not extend down to the river and there is free access to the single concrete footbridge which spans the stream.

241 The only crops now grown are oats and potatoes and a few vegetables, with some sown
[407] grass; natural grass provides most of the hay crop. Lime and shell sand and artificial fertilisers are used; the two former particularly on the ground near the river where the
[242] cultivation is in narrow strips separated by drainage ditches and ploughing is done by horses.
[824] Most of the cultivated land is on the gentler slopes behind the houses, where the use of a
[23] tractor is possible. Before 1914 most of the land within the original turf dyke was cultivated; here was grown and ground at the mill for meal for barley bread. Seaweed was extensively used as a fertiliser and most of the families kept eight or nine cows, so that there was a more plentiful supply of manure. Now, six of the families each keep one cow for domestic milk supply (two of the others each keep a goat). The township possesses no bull, but make use of those at Valtos or Ardroil.

233 On the other hand, the sheep soum is generally exceeded; instead of the entitlement of about 200, the total flocks grazed on the township pastures are approximately 500. The lambs are weaned early in August and put on Rudha Caol (Air Force use has not prevented this) and wedders are usually sold at the age of two or three years in Stornoway - many in October to reduce the numbers that must be pastured during the winter.

162 The total resident population of Aird consists of fifteen males and sixteen females.
Of these, twelve are over 65, six are aged 45 - 64, 11 are in the 15 - 44 age-group (there are only three married couples) and there are two children under 15. Nevertheless, most of them are complete families; only one person lives alone; no members are reported as
[66] periodically working away, no men and only two women are permanently away. Neither has there been much emigration since 1939 - five women only have married out of the parish. The tenants of seven of the crofts are over the age of 65, the only one in the 15 - 44 age-group is a new-comer to the district and does little croft work.

175 beginning of the resettlement movement which has given the modern crofters of the
36 district almost all the lands formerly occupied by small tenants. This process was
completed in the Bernera region soon after 1918, and the problem now - one which is
obviously going to become increasingly important - is not to give the crofters more land,
but to find active crofters for the existing holdings (see Chapter iii for more detailed
information on clearance and resettlement).

361 The ground plans of the existing settlements vary considerably, depending mainly on
632 the terrain. Where a township is spread along a fairly straight coast the original
tendency is for the croft boundaries to run at right angles to the coast and for each house
427 to be set on its own croft. The best examples of this are Hacklete and Kirkibost, where
an early nineteenth century (i.e. pre-clearance) lotting was readopted when the township
was re-settled in 1878. Linshader, Lundale, Crulivig and Earshader also follow the
same type of layout as nearly as possible, but Tobson, with the exception of Valassy, is
intermediate between a lotted and an unconsolidated township. Croir also differs: it
was laid out in 1921 but the disposition of the potential arable forbade a coastwise
organisation. The site of Breaclete is greatly broken by lochs and a sea inlet, and
consequently an essentially regular layout based along a main Loch Breaclete - Loch
Beg Breaclete axis, appears somewhat complicated. The accompanying diagrams
contrast the control exercised by physical conditions at Croir with the subordination of
physical conditions to a simple lotting plan at Hacklete, (Figure 28).

Within the townships, with the exception of Kirkibost, the distribution of settlement
361 seems to have changed little since the original lottings, for in most cases the sites of the
342 old and present dwellings are little further apart than is dictated by constructional
178 problems. It would appear generally that black houses were universal in the nineteenth
632 century except for the Lighthouse at 1 Croir (the oldest 'white' house in Bernera), Thule
House, (18 Tobson), possibly the tacksman's house at 11 Hacklete, the former farmhouses
at 20 Kirkibost and at West Earshader. However, with the establishment of Congested
Districts Board and of Board of Agriculture grants, housing was improved, early examples
being 5 Hacklete and 10 Breaclete. The resettled townships generally had improved
accommodation from the start. Improvement has greatly accelerated since 1951. In
most cases at the present time housing is of very high standard, only one blackhouse and
one near blackhouse are still occupied.

312 Water supplies and sanitation are less satisfactory. Most crofts by now have their
private water supply, thought it is hoped that mains schemes may be constructed within
the next few years. Sanitation varies in standard and in places there are still open
54 ditches, but all the newer houses have water closets. It is worth remarking in this con-
76 nection that tuberculosis is almost eliminated. Electricity has been available since 1952
to all crofts and most are connected, though not necessarily in every room. Cooking is
359 sometimes by electricity but more commonly by Calor gas and a tilted range or stove
(open or enclosed). Peat is cheap to those able to gather it themselves. Where, however,
help is needed to carry the cut and dried peats to the nearest road, difficulties may arise.
The cost of hiring labour for peat cutting may be such that it is cheaper to buy coal.

Access to Berneray by road is now comparatively easy. Where formerly Loch Roag
490 received the highway of communication, the road built to Earshader after the Great War,
494 and the £87,000 bridge to Bernera Island, built in 1953, have caused a revolution of
sites. Linshader is approached by a tarred branch road and the outlying Bernera shore
townships lie upon the narrow and twisting main road, though four of the six Lundale
crofts have no connection with it, and two of the Crulivig crofts, and West Earshader, are
somewhat isolated. On Bernera Island the old cart track from the pier at Barraglom
across to Tobson and Croir has been somewhat re-aligned since the construction of the
bridge. This is a good tarred road, as is part of the branch to crofts 3...8 Croir. The
old road to Kirkibost was tarred in 1959, though three outlying crofts near Barraglom
were still without a road suited to vehicles, and the branch within Breaclete remained
untarred. There is a new road to Hacklete from Breaclete which provides tolerable,
though circuitous, communication. Valassy is one of the most isolated settlements in
Bernera, linked with Breaclete rather than with Tobson by the footbridge and causeway
paid for by Congested Districts Board grant about 1903.

36 and across the croft boundaries and it is along these that the majority of the houses are
149 to be found so also are the roads followed the easiest course open to them so the settlement
178 has moved to the roads.

A particularly interesting example of this kind can be drawn from Upper Carloway
where a twofold movement of settlements has taken place; first, from about 150 feet
above sea level, where the original black houses were built, there was an uphill movement
to the upper of the two roads which cross the township at from 150 to 170 feet above sea
level, and, secondly (and more recently), there has been a move to build at from 25 to
30 feet above sea level along the lower road which has become the main axis for the public
342 services. Three main types of building exist then in this township. The first is the
blackhouse of which only one or two now remain. Even these are not the primitive type
of blackhouse, for they all have proper chimneys. The second is an ill-defined group
which includes buildings erected during the later years of the fishing boom and in the
period up to the Second World War. These houses are either one or two storied often
with the traditional dormer windows; they form the majority. Finally there is the
development of the modern bungalows which are built by the crofters but based on plans
supplied by the Department of Agriculture. Few have ventured to build away from the
level of the lower road.

342 How then does this pattern of settlement illustrate the changes referred to at the
178 beginning of this section? The original houses were abandoned gradually as the temporary
prosperity of the fishing enabled the crofters to build the better houses. These have seen
great changes, but in most cases they are still occupied. Some have been extended and
improved by their owners whilst others remain without additions almost as they were when
first built. That the crofter owns his own house has certainly encouraged replacement
[634] in recent times. The generous grants and loans provided by the Department of Agricul-
ture have been utilised to construct the modern bungalows on crofts where the original
croft house stands as a byre and where the second house is sometimes inhabited by some
relative or person who sublets a part of the croft. It is rare to see such successive phases
so close together in a landscape, reflecting the varying fortunes of economic enterprise
and the influence of government subsidies now so much a part of the life of the crofting
township.

Roads and public services.

141 Carloway's importance as a centre for West Lewis is accounted for by the fact that
at the break in the coastline caused by East Loch Roag the main road southwards from
Barvas turns inland to Breaslete. Near the point where it crosses the Carloway river
at Carloway bridge it is joined by a number of local township roads creating a focus for
community services (figure 38)[1]. Here also the line of the still unfinished 'Pentland'
road, projected as a direct link with Stornoway during the fishing boom, reaches Loch
Carloway and passes along its north shore to the pier at Borrowston. This substantial
pier was the scene of great activity during the period of commercial fishing before the
First World War.

369 The six hundred residents of the immediate Carloway area are served by eight travel-
494 ling shops as well as by the local stores. Bread, fish, meat, green-groceries, library
162 and bank all come to the end of the croft if not to the crofter's door. Of the vans one is
based on Carloway, one on Breaclete and the rest on Stornoway. A mobile film unit
visits once each fortnight. The churches and school rightly reflect their importance in
the community by the commanding position which they occupy just above the bridge. Here
too is the showground; the annual show attracts people from all over the island, being as
much a social as an agricultural gathering. Other services are more dispersed but not
far away. They include doctor and district nurse, policeman, post office, and football

[TEXT [illegible] 103]

1. [Presumably the author means figure 39--Analyst]

427 Although the croftland is individually held, individual control of the crofts only applies for six
241 months of the year. After the harvest, the croft land reverts to common grazing and the whole
221 township stock graze indiscriminately over the crofts. Thus basically the whole area of the
427 township, the individually held crofts and the common pasture, is common land, and it is clear
178 that the agricultural revolution with its system of enclosure has not yet fully refashioned the Crofting
Area.

Before 1900, there was a third element in the crofting landscape, the shieling (Gaelic - 'airigh').
175 The sites of the shielings are usually on slopes commanding a view of the surrounding area near a
253 spring or stream and usually two to nine huts belonging to the same township are grouped together
on a site; isolated shielings are rare in Park. In order to secure the pasture within the township
dyke for wintering, and to protect the unfenced crops, the cattle were removed to the hill early in
June, and the younger members of the households went out to live in small stone or turf-walled
huts to tend the cattle. The milk was either carried back to the township daily or made into butter
or cheese at the shieling. The distance of shielings from the crofts varied from one to five miles
in Park.

632 The affairs of the townships are managed by the Grazing Committee, elected triennially by the
township and presided over by the Clerk of the Committee. The duties of the Committee in the
past related mainly to the enforcement of soumings, but are now reduced to the disbursement of
subsidies, although responsibility for the maintenance of the township dyke and the care of the
township bull (usually lent by the Department of Agriculture but sometimes communally owned) are
also the province of the Committee.

361 The layout of the townships varies with the topography but the majority of the crofts are aligned
342 in strips from the moor to the sea (figures 4 and 5). Most croft houses are built on the crofts; in
former times, the majority of the houses were sited on the poorest part of the croft as all the
178 cultivable land was required for crops, but nowadays the houses tend to be sited near the road.

162 The official pattern of crofting is thus one of tenants, each living on his or her croft and sharing
361 in the rights and duties of the township. Table 1 gives an analysis of the tenants of the 215 Park
427 crofts. It will be noted that only one-fifth of the crofts are tenanted by those in the 15-44 age
241 group: a similar proportion are tenanted by those over 65 years of age. Absentee tenants account
for 14 per cent of the total. Women form under 10 per cent of the total, but only one in seven of
[466] the women tenants is the sole labour force on the croft. The intrinsic worth of the holdings can be
inferred from the fact that two-thirds of the male tenants in the insurable age group take supple-
mentary work, two-fifths of them forth of Lewis. Without an large proportion of the tenants either
fully employed in ancillary occupations in Park or elsewhere it is hardly surprising that the theore-
tical township organisation exists mainly in name alone.

427 Each croft, however, is not necessarily an agricultural unit; some are sublet by absentee
241 tenants or by tenants who are too old or too infirm to work their crofts. Of the 215 crofts, one-fifth
are wholly or partly sublet. In addition to the legal crofts, there are unofficial holdings which fall
into three categories, cottars, squatters and fewars, all legally without grazing rights. A
cottar[1] is a person, usually a close relative of the tenant, who builds another house on

1 These are the de facto definitions. Section 34 of the Crofters' Act of 1886 defines a cottar as follows:- "Cottar" means the occupier of a dwelling-house situate in a crofting parish with or without land who pays no rent to the landlord, as also the tenant from year to year of a dwelling house situated in a crofting parish who resides therein, and who pays to the landlord therefor an annual rent not exceeding six pounds in money, whether with or without garden ground, but without arable or pasture land". For fuller treatment, see Scott, J., "The Law of Smallholdings in
[113] Scotland," 1933, pages 152-155.

There is no legal definition of a squatter, and the above definition does not include any distinction between houses built on a croft and houses built on the Common Grazings.

[Garyvard] [Caversta]

342 At the moment Garyvard appears to be a go-ahead village, carrying out communal schemes
[162] which will benefit the township as a whole. However, the age structure of the population is abnormal
since 60 per cent of the population is over 45 years. The future in Garyvard offers young people
192 hard work, little money and no entertainment, making the attractions of the cities and industries
of the mainland quite irresistible. Unless some industry can be started the future bodes ill for the
area, since most crofters are of the opinion that a weekly wage packet would more than compensate
191 the loss of their independence. Perhaps it is symptomatic of the age of National Assistance and
subsidies that man cares more for momentary rewards and the luxuries of life. This is well
understood by parents who encourage their children to leave the township for employment either
in Britain or within the Commonwealth. The Lewisman is no sentimentalist clinging to dying tradition
and a way of life. His present desires have been re-cast as a result of his increasing contact with
the world beyond the Hebrides and he is prepared to abandon his home where it defeats his aims
and purpose. Unless prosperity can be brought in by way of industry, tourism or increased croft
efficiency, possibly through co-operation in working and marketing, it is possible that we are
witnessing the end of a community.

CAVERSTA

Helen Mackenzie

191 Caversta lies along a southern inlet of Loch Erisort, five miles from the Minch and is partially
sheltered from east winds by the Cromore peninsula and Eilean Chaluim Chille.

133 The physical nature of the terrain is irregular, rising steeply from the water's edge to a level
361 of approximately 225 feet. To the west and to the east, the land slopes to the river estuary and it
is here that the settlement occurs. Particularly in the north-west, two marked breaks in slope are
visible at 75 feet and 100 feet above the loch, which is here bordered by a 25 foot rock face. The
resulting platforms are separated by faces of bare rock. The valley of the Caversta River is a
427 noteworthy feature. Below a small loch, the river follows an irregular course though a wide and
241 shallow moraine-filled depression and a quarter-of-a-mile from its estuary, has cut through some
low hills rising about 30 feet above the depression. At this point, its course becomes steeper as
it passes through a small gorge, which is probably an overflow channel.

197 Trees are non-existent and the natural vegetation consists of Sphagnum on the peat bogs in the
hollows and grasses and sedges on the gentler slopes. The steeper, less waterlogged slopes, often
broken by rocky bluffs, have heather cover; bracken growth is kept in check by heavy grazing.
178 Forty-six acres of land have been reclaimed by clearing heather and removing peat to form the
427 crofts, but the soil, which varies in depth from a few inches to a few feet, is very acid.
241

The six legal crofts vary in acreage from 4.75 to 8.5 acres and a squatter has 5.5 acres of
129 enclosed land. The township is in two parts: Toristea, with the two smallest crofts, lies at the east-
241 ern extremity, while the other five holdings, also bounded by a dyke, border Tob Caversta, an
632 inlet of Loch Erisort. The crofts, which run from the shore to the township dyke, were set prior
[175] to 1861; originally the township formed part of Crobeg Farm. The legal units are, in fact, operative
units except that one of the Toristea crofts, now unoccupied, is used for wintering lambs by the
absentee's brother, a resident of Caversta.

342 There are no occupied black houses remaining in either Toristea or Caversta, as during the
past fifty years new dwellings have been erected in dressed stone or corrugated iron, usually with
roofs of asbestos slate, tarred felt, or corrugated iron. Several old thatched houses are now used
as barns and byres.

[Marivig]

There are only fifteen cows, two yearlings and four calves in the township, and the crofters with no cow rely on neighbours, or on tins, for their milk supply. All but two of the crofters keep sheep, there being four hundred and eleven ewes, one hundred and eighty-five sheep and two hundred and thirty-four lambs belonging to the township. The common grazing (including the off-shore islands which are grazed by five different crofters each year) is used for the sheep in summer, while all but one of the crofters winter their sheep within the township dyke on the crofts. Most crofters keep hens, and surplus eggs are sold to the Stornoway vans.

Peats cut on the common are transported by lorry to the crofts, while peats from the north end of the peninsula separating Loch Marivig from the sea must be carried in creels.

Nearly every crofter owns a rowing dinghy which is moored in the loch off the end of his croft, and with this supplements the family food supply. One herring boat, operating nightly from Stornoway and returning to Marivig at weekends, is all that is left of a fairly large fleet which operated before the war. A second boat, unused for two years, lies shored up on the beach, and two others are wrecks. Over fifty years ago there was a curing station at Marivig. One crofter fishes lobsters during the winter and markets them in London.

Of the other crofters, only two supplement their incomes by weaving, one by working on the roads while several men work partly on the crofts but are periodically away whaling in South Georgia, fishing, or on hydro-electric schemes. Several others are in the Merchant Navy. The gradual migration from Marivig, especially of the young people, is reflected in the high average age of the permanent residents, and in the numbers in the school -over one hundred pupils in 1900, thirty-nine (including sixteen from Calbost) in 1946; but only nine (none from Calbost) in 1958. The young people leave the township to train or work on the mainland (generally in Glasgow) or in Stornoway, while their elders accept the view that "there is nothing for the young people here".

The township has a Post Office and telephone kiosk which also serve Calbost, while lack of a shop is partially compensated by a choice of four vans from Stornoway and one from Gravir. There is a daily bus from Gravir via Marivig to Stornoway and back: the return is over 10/-. The road which reached the township from the west in the late 1920's has a tarred surface and is much better than the later road southwards to Gravir which is untarred. There is no church in Marivig and most of the population attend the Free Church in Gravir.

Within the township the two arms of the township road serve all but two of the crofts and the sites of the newer houses, few of them more than thirty years old, tend to be near the road, while the ruined houses found on most crofts are often nearer the sea. Only two thatched houses remain and the other inhabited houses are built of stone roofed with asbestos slate, or of corrugated iron. All the crofts are supplied with electricity from the grid, but very few have a piped water supply; rainwater is collected from the roofs and piped for washing, with a separate piped supply from a well for drinking. All other houses draw water from wells.

The stormy winter weather, rocky terrain and poor soil are all blamed by the residents for the drift of population away from the crofts, but those who remain have little incentive to work the crofts more efficiently owing to the very hard labour involved. It is suggested that with more intensive cropping and more cattle, each croft could make a comfortable profit and surplus milk, potatoes and eggs could be marketed in Stornoway - the milk replacing that at present brought from the mainland. Such development, perhaps on a co-operative basis, together with a revival of the fishing industry and introduction of a tourist industry, by building a small hotel or guest house and attracting anglers as well as those who simply wanted scenic beauty, might bring prosperity back to a township which otherwise may well be derelict in the next twenty years. But the capital required for the two latter enterprises is not available within the township.

[Lemreway] [Orinsay]

The West Highland Survey Township Card[1] describes Lemreway as "predominantly a fishing township". The remains of an old curing station are visible today and until 1947 there were twelve boats operating from Lemreway. A declining market, increasing cost of gear for obsolescent boats and the lack of a landing stage led to the decline of the industry in this township. Today there is one fishing boat which lands its catch in Stornoway: working with modern equipment, drift and ring nets, it provides a regular income for a crew of six.

An examination of the population statistics proves interesting, especially when compared with those for Orinsay. Lemreway's resident population of just over 70 males and 70 females is large considering that there are six unoccupied crofts. Eleven of the crofts have more than one house - and the cottar population forms over a third of the total residents. More than two-thirds of this resident population is in the two important age groups - between 15 and 64. With over forty resident males in the working age group, Lemreway provides a striking contrast to other crofting townships in Park.

Fourteen of these men are full-time croft workers, while nine others find work in ancillary occupations such as weaving and fishing. A further eight supplement their croft work with regular employment - a postmaster and a postman, a bus driver, a lorry driver and several weavers. Just over thirty people work away from the township permanently, fourteen in the Merchant Navy and nine girls in domestic service, while a further nine engage in seasonal work.

Emigration from the township has continued steadily with forty people leaving since 1939. Nevertheless, Lemreway has a larger proportionate resident population than most townships.

Only four thatched houses are occupied and housing conditions generally are good. Every house has electricity, but, with four exceptions, water has to be carried from springs and wells. Most of the present houses were constructed in the 1930s and they are usually near to the road. Ruins of the old houses remain, some being used as byres, and these were built either along the shore or up the slope in the shelter of the hills, where the house was near the sheep, the peat and the springs. Today supplies of food, peat and even seaweed are brought by road.

Mention must be made of the possibilities of the tourist trade in Lemreway with its most attractive situation and reasonable road connections. An approach has been made to the Scottish Youth Hostels Association and while hostellers could not greatly increase the income of the residents, they would stimulate interest in the area. Accommodation for summer visitors, other than relatives of the crofters, is difficult to find but it seems that at least three houses could be used.

It is possible to be optimistic about the future of Lemreway, as at the moment considerable enterprise is being shown. A Ferguson tractor, bought this year by a man returning from whaling, is an example. It is to be hired out and could be put to good use in some parts, especially on the outend. The attempt to improve the common pasture and the new extensions to neatly painted houses all reflect a combined effort to improve conditions. The old economy of crofter-fisherman is being adapted to modern times and crofter-weaver, crofter-postman and crofter-bus driver are the contemporary employment combinations.

The pessimism and apathy noticed in many crofters is to be found in Lemreway but above this is the impression of enterprise. If Lemreway can continue to adapt itself to changing conditions, it may be able to combat the 'drift to Glasgow' and continue as a successful community.

ORINSAY

Beth Blowers, Brenda Turner and John Wearmouth

Orinsay is a small crofting township clustered, in the form of a horseshoe, around the head of a sheltered bay on the northern side of Loch Shell. Most of the houses are situated within fifty yards of the shore on a narrow strip of level land, while the crofts extend from the shore on to the moor

1. The Directors of the Crofting Survey are grateful to Dr. F. Fraser Darling for granting access to the individual Township Cards, which are a storehouse of information. For detailed contents of the cards, see West Highland Survey p. 247.

5: Caird et al.	K-5	(1958)	1959	ES10 Highland Scots ES10 Park

231 [288] Recent trends also point to a decline in the numbers of sheep, although more are kept now than fifteen years ago. From 1942-51 the numbers were more than doubled (263-565). A great deal of this increase must have been a result of the ewe subsidy, but part at least may be connected with the war and post-war boom in Harris tweed. By 1955, when the subsidy was suspended, numbers had already begun to decline and have since fallen steadily. This year the township has only 374 breeding ewes while the rearing of only 236 lambs would suggest a further decrease in the future.

221 233 All the crofters keep some sheep although individual stocks vary from 15 to 150. For most of the year these sheep are grazed on the common pasture on the moor or on the eighteen acre island in the bay. In August, however, the lambs are gathered in for weaning and dipping; in November the gates are opened and all the sheep allowed to graze on the cleaner pasture within the croft boundaries. If necessary they are given fodder, but from the beginning of January they are encouraged to return to the moor, although the gates are not 'officially' closed until May.

311 233 The total area of the common pasture exceeds 1500 acres, but most of this consists of hummocky, waterlogged peat moorland supporting only poor quality coarse grasses and sedges. Over 700 sheep now graze this area and the apparently large common pasture is in reality drastically overstocked, a process which must inevitably harm the animals as well as the land.

231 235 [435] No pigs or horses are to be found in the township and each crofter keeps very few hens, normally just sufficient to provide eggs for home consumption. Any surplus eggs which do remain are sold to the Co-operative van, but prices are so low that the keeping of more than a dozen hens is far from profitable.

434 464 228 It can be appreciated that crofts of this size and quality can neither provide the crofter and his family with sufficient income, nor fully occupy the available labour force. As a result, people in the past have turned to the sea. Indeed the West Highland Survey describes Orinsay as "primarily a fishing township". Today the herring fishing has disappeared entirely and only one crofter still does a little lobster fishing, sending his catch direct to Billingsgate.

161 162 There are now 45 people resident in Orinsay but an examination of their ages reveals that less than half of them are between 15 and 64 years. Indeed there are only six resident males between these ages, and three of these spend at least part of their time working away from the township on the Eishken estate.

366 368 166 167 464 505 228 462 352 454 As there is neither a school, post office, shop nor garage in Orinsay, there is no available occupation in the 'service trades'. Therefore, over half of the males between the ages of 15 and 44 are permanently away in the Merchant Navy, returning home only for holidays, while another third are seasonally away with the whalers. Similarly almost half of the females of similar age work in domestic service in Glasgow. It must be realised that most of these people working away assist their families at home, and that a large part of the croft incomes are made up of money sent home, together with pensions and other allowances. Emigration from Orinsay to other areas has continued steadily, twenty people leaving the township since the war.

312 377 312 [206] 366 [491] [494] On the whole, housing conditions are good, due to relatively recent construction. There is only one traditional black-house, and even this house has electricity: only one house is without it. Water supply is not so certain as wells and springs are the only source. The township lacks a telephone and a shop, but is served by travelling vans. A good road, constructed within the last decade, connects Orinsay with Gravir; entering the township via the valley to the north-east, it serves directly all but three of the crofts. A bus leaves daily for Stornoway, about thirty miles distant.

161 162 Like so many other crofting townships Orinsay, above all else, gives an impression of congestion. The self-same hills that provide shelter also restrict cultivation. The crux of the situation is that land, extremely marginal in character, is being worked by too many tenants on holdings too small to be economic. With three residents to every two acres of cultivated land, Orinsay must be seen as an 'overspill' - an unfortunate result of the cottar problem in the 'twenties'.

GROUND PLANS OF SHIELINGS

175
233
342

Fig. 10

/facing p. 39/

161 Table XIX summarises the population structure and trends for the four districts. It is a
162 that the two districts without service centres, which provide a range of ancillary employmen
166 experienced more severe depopulation since 1939. This table also underlines the fact that e
167 from seasonal employment are insufficient: the incidence of permanent employment furth of
434 districts is three times as great as the incidence of seasonal employment.
464

APPENDIX B

SHIELINGS - A NOTE

John E. Wearmouth with illustrations by Beth Blowers

176 From Figure 1, compiled from the First Edition six-inch map of the Ordnance Survey (18
233 to 1852) and from personal observations, it is clear that the shieling system was at one time
an overall feature of Park for the whole peninsula has traces of this transhumant economy.

361 The rudimentary structures, some of turf, others of stones and roofed with bracken or
342 heather thatch, are all sited on well drained sites, the majority on mounds. Almost all the
sites are close to lochs or streams. The majority are in loose groups of from two to nine
buildings, although there are some in isolation; no site has as many as twenty-six building
as found at Airidh na Gaoithe in North Uist.

342 There appears to be two distinctive shapes of building - oval and rectangular (Fig.10).
All shielings measured exhibited a remarkable similarity in dimensions, from 17½ by 9 feet
to 13 by 12 feet. The oval structures are generally larger than the rectangular ones. Mo
of the shielings had two entrances, often, but not always, opposite each other.

195 The shieling system died out in Park about 1880 but the cattle continued to graze around
283 shielings on the better grass, and the crofters had still to go out to milk the cattle at the shi
although they no longer lived there. The sheep still use the mounds for shelter and grazing
These features of an obsolete economy are still easily recognisable from the luxuriant grass
cover in a wilderness of peat bog and bare rock.

APPENDIX C

NORSE SETTLEMENTS NAMES IN NORTHERN PARK, LEWIS

Bridget M. Gordon, B.A., B.Litt.

103 See: Magne Oftedal, The Village Names of Lewis in the Outer Hebrides; in Norsk Tidskrif
113 Sprogvidenskap, vol. XVII, 1954, (Oslo), pp. 363 ff.

103 Professor Oftedal points out the difficulties of these Norse-Gaelic settlement names: i
accurate spellings even in modern times, and lack of any useful evidence from older source
make almost all the derivations a matter of conjecture. Sometimes two or more ON equiva
are possible (e.g. for Calbost), sometimes no satisfactory solution can be found (e.g. for
Lemreway). Since Professor Oftedal frequently bases his explanation on pronunciations n
recorded in written forms, his evidence is largely followed here.
SHIELDERNISH: the second element is N nes, 'headland'. Oftedal's explanation of the fir
as silda, genitive plural of N sild, 'herring', is satisfactory linguistically, but seems unlike
in meaning.

the eighteenth century these 'black houses' would be replaced by houses of stone and lime, and a few of those survive.

Of the fort built by Cromwell on the Point, no signs remain. For tactical reasons, the best site would seem to be the neck of the Point, from which the guns of the fort could defend the houses, stores and quays. The irregular building line near the point marked T, a Town House at a later period, may correspond to the northern angle of the fort. The fort appears to have been standing when the original drawing was made for the engraving in the Old (or First) Statistical Account of Stornoway, *c.* 1793.

By the time Wood drew his plan in 1820, houses on the Point no longer looked exclusively on to the axial street. The main alinement of interest came to be the shore, marked by a properly built quay. Today, the Point Street houses have fallen into decay but many older houses still stand in fair repair along the 'Beach' or Quay.

Thirdly, from the nineteenth century, until 1914, two-storey, flatted tenements, hotels and houses of middle-class people were built upon a grid that followed upon the old field plans. In an alternative plan, proposed about 1820 but not adopted, a diagonal vista opened out to the Established Church, built in 1794 on rising ground. The modest Seaforth Lodge which had stood across the harbour was replaced in 1850 by Stornoway (or Lews) Castle, its pseudo-Tudor style designed to please the new improving landlord, Sir James Matheson, who had purchased Lewis in 1844. Presented to the people on the break-up of the Leverhulme Estates in 1925, a new technical school has taken it over. A few villas also grew up on outlying roads. Thus, a mere village in 1801, and among the smaller burghs

Lewis and Harris

342 yard and occasionally a barley-kiln in which to dry grain
343 before malting it for home-brewed beer. A 'black mill',
351 with its primitive horizontal water-wheel, stands apart by
{251} some burnside.
{273} Round the circular hearth, a large company can assemble in very social fashion for talk, story and song, the meeting
354 *together* (*ceilidh*). By the transfer of the hearth from the
571 centre and the substitution of a gable fireplace and regular
538 chimney, the social circle is halved, while meantime the tales of the *ceilidh* are forbidden or forgotten. Happily
[178] the bench still stands against the wall, near to the open
[353] door, through which neighbours slip in with a word of greeting to find a customary welcome.

342 The dwellings on the summer pastures out on the moors show great variety, illustrated in Fig. 10(B). A simple
361 type in use is built of turf and stones, lightly roofed with
[178] turf placed on spars. A more primitive 'beehive' type (which fell out of use before 1900) was stone-built and
[171] corbelled, probably for lack of timber. And whereas the lighter type always stands by itself, the corbelled type was added to until a dozen cells formed a single mass, suggestive of ancient 'neolithic' hamlets as at Skara Brae in Orkney, described by Childe, and of the domed, corbelled huts of the ancient East.

[343] A further type was the 'spring house' of Tolsta, NE. Lewis, in which both cattle and folk sheltered in spring a little way from the village, before going out to the more
{124} distant moor. Mr. Donald Macdonald, F.R.S.G.S., a
{178} native of Tolsta, informs me that the spring house was in use until 1936. He remembers vividly how life in the shieling restored health and colour after the winter.

Lewis and Harris

342 maintained—once an important aid to the survival of half-
• 343 starved cattle. A slope from the dwelling-quarters down to the byre facilitates drainage: normally the length of the
[178] homestead follows the slope. The separation of house from byre took place in Harris and Uist over seventy years ago by County Council decision, but in most of Lewis, even in 1947, about 40 per cent of the homesteads were
342 of the primitive type, outwardly but little changed. This separate cottage, as in Harris, is a shapely little structure, roughly symmetrical and particularly pleasing when the walls are whitewashed below the pale-gold thatch.

342 The surviving 'black house' is a stone structure. As
343 Stevens has written, "the rock of the island is hard to
[314] work, and hard to win", and may be covered by peat. Undressed stones are collected and sometimes carried for
[324] long distances. Before dynamite came into use, a very large stone could be broken up by lighting a peat fire on it, then dashing cold water over it. By an old Gaelic custom, the bachelors of a township used to help to build the house for one of their friends who was about to marry.
[333] Lime for mortar being absent from the island, the walls are built dry. The wall is double, the space between being filled with earth. Hence it may be six feet thick
[354] at the base, though barely six feet high. Typical primitive houses lacked windows, only a little light entering through the smoke vent and through a piece of oiled skin, replaced latterly by a pane of glass let into the thatch of the roof or by a deep window aperture in the wall.

342 Roof building is a difficult problem in construction,
343 on account of the scarcity of timber and the strength of the winds, and explains the narrow plan. Wood was so
313 scarce that when a house was abandoned the frame of the
[182] roof was removed, the spars being the tenant's; but in

/p. 80/

342 later times the landlord might supply timber. Long
343 ago a main source of timber was the shore. The length
313 of the house may be fifty to sixty feet, and the inside
422 breadth ten to twelve feet, spanned by ten or a dozen
178 pairs of couples on which are laid transverse 'cabers',
which may be tree trunks, branches, odd wood, old oars,
or, exceptionally, sawn timber. The tops of the walls are
353 finished with turf, to keep the filling from being washed
out, and to provide a smooth bearing for the couples, the
ends of which are pushed into the turf so as to bear on
the inner half of the wall; the rounded form and absence
of overhanging eaves prevent a gale obtaining purchase
on the roof, but a gable with chimney is now usual on the
356 end wall of the inner room. The rafters are annually
covered with turf, and the roof is thatched with thin, short
barley straw, which was pulled up, not cut, after the ears
were picked off, the roots gripping well, and the stem
hanging outward and down.

353 The door gives direct access to the byre (*bathach*),
through which one reaches the middle part, or living-room,
'at the fire' (*aig an teine*), from which there opens the
inmost part, the 'room' with bed-closets. There is no
ceiling to the primitive house, the row of box beds having
tops to keep off the drips of rain water. In the middle of
the earthen, sanded floor of the living-room is the circular
hearth, built of stones with clay between, and raised a few
inches, with no chimney.

343 In the byre, the manure accumulates from spring to
spring, and a breach is made in the end of the house for
the annual removal of the manure. There are no privies.
Where there is fodder and straw in any quantity a barn
342 is added. Stacks are rare because of wind. A low wall,
343 continuous with the house and barn, may enclose the kale-

795 collected, and an annual report on morals, which usually condemns drinking and "the decline in moral standards." Ministers are trained in a college in Edinburgh. Many [199] are Gaelic speakers, although the number is said to be declining.

794 When a congregation loses a minister because of death 793 or other reasons, it issues a "call" to some other minister. The congregation is familiar with the names and preaching styles of a number of ministers, who have in the past visited the community as guest speakers. The congregation votes for a minister from a list made by the lay officers of the church. The minister may or may not accept the call.

795 The Free Church and the Free Presbyterian Church, two [198] fundamentalist Protestant sects which have survived the tendencies toward unification evident since the turn of the century, are strongest in the Highlands and Islands. Shawbost contains a few people who belong to the Church of Scotland, but most villagers belong to the Free Church.

795 The only church (in the sense of a building in which sermons • 346 are preached) is a Free Church which was built in 1883, [193] supposedly after men from Shawbost helping to repair the fence at the minister's manse in Carloway, where they then attended church, were refused boiling water for their oatmeal "brose" by the minister's wife. A building in which members of the Church of Scotland worshipped was built

795 • 346 before 1883 but now serves as a school museum. When it closed, most of the members changed to the Free Church.

794 The present congregation includes many families from the neighboring village of Bragar, who come to church for the morning service and usually attend a prayer meeting in their own village in the evening. Once a month the minister gives an evening sermon in Bragar. The left side of the church, where most of the Bragar people sit, is called "the Bragar side."

Lay officers of the church, called elders and deacons, are elected by the communicants, those members of the congregation who have taken Communion. Both elders and deacons sit in special seats at the front of the church beneath the pulpit. Deacons, who are concerned with material matters such as collections and church property, sit in the "wee seats" slightly lower than the partitioned seats of the elders, the "big seats." The deacons meet in a deacons' court which the elders may attend. A meeting is held once a year at which the congregation is told matters such as how the church money was spent. Kirk sessions are limited to elders, who decide who will be baptised or take Communion.

[621] Each street or neighborhood within the village has its own deacon and elder, to whom members of the street bring various matters that concern church organization, such as plans for baptism.

ECOLOGY AND PHYSICAL ENVIRONMENT

361 ditches, indicating perhaps the love of old-time planners for
*175 following existing lines and patterns. A plan of Stornoway drawn up by a John Wood in 1821 shows the town's development along definite grid lines with a few main streets, most of which were comparatively long and running south-north, seawards to landwards.

In 1918, when Lord Leverhulme made his bid to centralise the scattered, failing fishing industry of the island at Stornoway, he envisaged a further stage for the town. He began to build new houses, and had a grandiose proposal to reopen the diagonal arrangement indicated in John Wood's plan and centre it on some great new building. This fell through on his departure from Lewis; and since then, building here has become much the same as on the Scottish mainland.

361 In more recent years Stornoway has seen a kind of suburban development with, in particular, a new housing scheme of private dwellings in the same area as that proposed by John Wood.

• [346] This area also contains the new primary school. A recent estimate of the cost of the building work, involving new houses and municipal facilities, amounted to almost £3 million. Municipal

[362] housing has been provided in smaller areas cleared of older houses. Of the 1600 houses in the Burgh, 50 per cent belong to the Burgh Council or the County Council, the balance being private.

HISTORY

172 anchorage in the Loch. The circle enclosing the cairn consists of thirteen stones and has a diameter of some 37 ft. The avenue, which approaches from the north, contains nineteen stones. It is 27 ft wide and 270 ft long; it forms the long limb of the cross plan of the design. Southward was another shorter avenue of twelve stones; and eastwards and westwards two lines of four stones each, thus completing the cross design. The stones range in height from 3½ to 15½ ft. Each is packed in at its base with small stones to keep it firmly in position. There are signs that Callernish, like Stonehenge, was built in stages. The material, unlike that used for Stonehenge, was from local sources (often Lewisian gneiss).

In the Sound of Harris, on the small island of Berneray, there are two stone circles of some interest. Scattered through Harris and Lewis there are also many solitary stones to be seen: at Borvemore, in Harris, which appears to have been one of a circle, and at Nisabost, also in Harris, where stands Clach MhicLeoid (MacLeod's Stone). Another standing stone is on the edge of the rocks by the shore, just below the church, on Boreray, one of the now-uninhabited islands in the Harris Sound. In Lewis, the menhir which figures most in story and legend is the Clach an Truiseil, on the gentle slope of a hillside near to Balantrusal, on the west coast. Nineteen feet of this stone are above ground. It is about 6 ft in width; nearly 4 ft at its maximum thickness. The tradition in Lewis is that the stone was erected to commemorate a victory by the Morisons of Ness over their long-standing enemies the MacAulays of Uig; of course the stone is older than any of the Lewis clans.

[113] For a full inventory of the ancient and historical monuments, one is referred to the 1928 Report of the Royal Commission which was set up to record such constructions in the Outer 172 Hebrides. Apart from those items of pre-Christian years, there are 346 a number of other structures with an ecclesiological reference: Teampull Eoin, at Bragar; Teampull Pheadair, at Shader; Teampull Bhrighid, at Mid-Borve; Teampull nan Cro Naomh, at Galson; Teampull Ronaidh, at Eoropie, and others. These latter, together with the Tigh nan Cailleachan Dubh (house of the black old women), indicate a reasonable degree of saturation by some form of religious recognition; the names suggest a period about halfway

[TEXT CONTINUED ON PAGE 37]

PREHISTORIC REMAINS

to AD 1000. The base of the missionary work was most probably 172 Iona. The old Celtic Church, with its monastic basis, sent out 346 many who sought the hardship and solitude of life in the islands [199] of the Hebrides as a means of example to the inhabitants. Today, the ancient cell sites, churches, burial-places, are in ruins, no more than a heap of grass-covered stones meriting scarcely a glance. Even on the outlier islands, such as the Shiants in the Minch and the Flannans in the Atlantic, are found these relics of ancient sites where the religious element was strong, overriding enough to be carried to the present day in traditional form.

From time to time archaeological finds are made in various 172 parts of the island. Perhaps the most famous was the discovery of the Uig Chessmen, to be seen today in the Museum of Antiquities in Edinburgh and in the Ivory Room of the British Museum. In the spring of 1831 an exceptionally high tide, with a gale wind, undermined and carried away a considerable portion of a sand-bank at Ardroil, in Uig. A small stone building, like an oven, was exposed at some depth below the surrounding ground level. A crofter who happened to be working nearby saw this and, excited by curiosity, broke into the structure. On seeing what he thought to be an assembly of elves and gnomes, he fled home in great distress. His wife, of a bolder nature, went to see for herself and recovered ninety-two pieces of ivory figures: fourteen draughtsmen, eight kings, eight queens, thirteen bishops, fifteen knights, and twelve footmen or pawns. These chess pieces, carved out of walrus ivory, date from about 1140 to 1160; they are of Norse origin, though probably carved by monastics who knew in detail the dress of the dignitaries which make up the set.

Some details of how the people of the Western Isles lived 3,800 years ago were revealed in an archaeological excavation in Northton in 1966. This site showed evidence of more or less continuous habitation from the late Stone Age onwards; as each succeeding layer of sand was taken away (it was excavated to a depth of some 14 ft), centuries-old stages of habitation were revealed. The higher levels of the site belong to the Iron Age; the earlier levels date back to the late Neolithic/early Bronze Age (about 1800 BC). Such sites as this are extremely rare in Europe, and Northton is the only one of its date in Scotland. Many fragments of the pottery known

HISTORY

*175 648 cester College, Oxford University, with an estimated date of 1653, the year in which the English garrison was placed in Lewis. Nothing now remains of that fort built by Crispe's soldiers, though the whole area on the small point of land, present-day Point Street, is redolent of historical atmosphere, despite new buildings.

RELIGIOUS HISTORY

*175 Ecclesiology is a horse of many different colours in the island. Tradition goes right back to the early stirrings of Christianity in Scotland. Indeed, one of the most important religious sites on the • [346] island is St Columba's at Eye, near Aignish, some seven miles from Stornoway. Though the name might suggest it, there is no proof that the Gaelic abbot visited Lewis. But it is more than likely that a follower of his did so in his name. Part of the church at Eye is Norman, which gives an approximate date of origin, though it is necessary to take some account of the long interval between a development phase in one country and its adoption in another country quite insulated from change, as were the Outer [173] Isles in medieval times. According to tradition, the church was built on the site of a cell occupied by the Celtic saint Catan, who is believed to have lived in the sixth or seventh century. Possibly this is the same Catan to whom a shrine is dedicated at Mealasta, in Uig, close by which the remains of a nunnery have been found, called by a Gaelic name meaning 'the house of the old black women'.

*175 St Columba's is mentioned in records from 1506, when it is 346 described as a 'rectory'. At present, though in a ruined state, it still shows its former strength of character, both as a building, a place of sanctuary, and a place of worship. It has also been called [764] the Valhalla of Lewis, for tradition says that some nineteen Chiefs of Siol Torquil, the MacLeods of Lewis, are buried in its grounds. William, the fifth Earl of Seaforth, also found there an uneasy bed beside the enemies of his ancestors, who wrested Lewis from the MacLeods.

Another significant church is St Olaf's, or St Molua's at Eoropie, at the Butt of Lewis. Recorded evidence first indicates the existence of the church in 1630, where it occurs in a report

RELIGIOUS HISTORY

by Captain Dymes. The saint laboured mainly in the Hebrides; 175* he died in the north of Scotland and was buried at Rosemarkie, 346 • on the Scottish mainland. Tradition ascribes the building of the [173] church to the tenth century by King Olaf of Norway; though a more realistic date for its foundation is the fourteenth century. That it occupies, as so many other small churches do, the site of a former cell is quite acceptable. The church, so Dymes tells us, [562] had a 'sanctum sanctorum', so holy in fact that no women were ever allowed to enter it.

In Harris, the outstanding religious building is St Clement's, at Rodel, described in Chapter 8. There are, sprinkled like a measured largesse, small ruins of chapels, cells, oratories and wells; but only tradition has clothed these tumbled stones with the airs of the once-living. A map of the island will show up these sites, which are well worth a visit if only to spend a short time in reflection under the island sky beside ancient stones.

Other old ruins are to be found on the island of Calum Cille (Columba) in Loch Erisort. It is on record that the monks who [199] came from Iona to convert the islanders from pagan forms of religion to Christianity landed on the island about the middle of the sixth century. They founded a church with its burial ground, which they dedicated to their master, hence the Gaelic names: Eaglais, Cladh, agus Eilean Chalum Chille. Tradition also mentions a mill, Muileann-na-manach, but there is not one stone left on another to indicate its exact site. The old burial ground served the parish of Lochs for many generations until about a century ago. The people of the island were in medieval and post-medieval times profoundly religious; this reverence was more often than not carried over into the half-world of superstition.

Though the tangible remains of religion's progress are to be 175* seen, the recorded history of religious progress, its phases and [199] developments, is scant. One can only assume that it was the Columban Church which first introduced the new Christianity to the Lewis folk. The earlier religion was the stock on to which the new was grafted. The result was an amalgam which was nothing if not strange to those many visitors who came to comment on the island scene; for it was neither Christian nor heathen. Yet, again, a strong thread of veneration ran through the product

EDUCATION

houses prior to 1854. Monthly returns of attendance were sent 17 to my office, and parents who did not keep their children at school 87 were dealt with, but in many cases to no avail, as they often told [8 me they did not want to give their children wings to leave them.'

In 1833 there were thirteen schools in the parish of Stornoway, [2 according to the *New Statistical Account*, 1840-46, which records that there were 586 children between the ages of six and fifteen years, and 1,265 persons above the age of fifteen in the parish who could not read. Barvas had three schools in 1836; Uig had five in 1833. In Lochs, in 1833 a parish school had just been erected, and four schools were maintained by the Gaelic School Society; yet out of a parish population of 3,067, only 12 could write. After the Disruption of 1843, the Free Church established a large number of schools throughout the island. And soon after Sir James Matheson took over the island he built schools in those districts not catered for by other agencies.

In 1865, the Government began to prepare for the Education Act of 1872, and sent Sheriff-Substitute Nicolson to the island to investigate the state of education there. At the time of his visit there were forty-seven schools, supported by as many as nine different agencies, persons, or institutions. The number of pupils [16 on the rolls was 3,332, with 2,647 in actual attendance. Nicolson computed that there were some 2,500 children on the island who did not normally attend school, and who should have done. A [3 large number of schools were little more than thatched houses. Fifteen were good; fourteen tolerable; and eighteen bad or inadequate. In the third group he classes 'those that cannot by any standard of comfort or fitness above that of troglodyte, be considered suitable for having the work of education carried on in them, or any work indeed, to which the prevalence of smoke and moisture are infavourable.' Of the children who attended these schools, 79 per cent received tuition in the Scriptures; 85 per cent were taught to read; 39 per cent were taught writing; 32 per cent were taught arithmetic; and 16 per cent taught needlework.

The Education Act of 1872 put an end to the old parochial 17 system, and virtually to other agencies which it found at work. 87 The schools on the island were brought into line with the re- 65

427 651 crofter pays only half of the assessment, which is based on rental value, and he is granted an additional benefit by having the land devalued seven-eighths for purposes of taxation. The majority pay £3 a year, or less, in rent, and, with a rateable value of 5s, or less, between 1s and 2s in taxes annually. Many pay no taxes.

427 342 423 On his small plot of land the crofter has his cottage. Here we find another rather unique interpretation of the laws of land tenure. Although the crofter is an occupier of the land, he is the owner of his dwelling. If he or one of his ancestors did not build the house, frequently with a grant and/or loan from the government, he will have paid "compensation" to his landlord for the dwelling upon accepting occupancy. Should he, at any time, relinquish his right to the croft, the crofter, in turn, will be entitled to full "compensation" for the value of the improvements on the holding as determined by the Land Court. The crofter's home is not entered on the county valuation roll and, therefore, is not subject to assessment.

427 241 233 In addition to the land under crops and improved grass, the crofter's rent entitles him to a share in the unimproved township grazing lands which are held in common and used under a system of allocation known as "souming." In each township, the collection of individual holdings, the crofters elect a grazing clerk and committee. They determine the number of cattle, sheep, and horses the individual is allowed to put out to graze. Usually each crofter has an equal share, but in

CHAPTER III

THE ISLAND HOME: HOMESTEAD, TOWNSHIP AND BURGH, AND THEIR POPULATION

(A) THE LEWIS HOMESTEAD AND THE TOWNSHIP

1. *The Black House*

342
• 343

THE 'black house' of Lewis proper contains within four walls—or rather its one continuous wall—both men and animals (Fig. 10(A)). It is the simplest surviving homestead in Western Europe. The basis of its plan, with its threefold division—for animals, for living, and for sleep—makes it not merely a house but a home [353] and steading in one, a single homestead. The basis of its plan is still found on many a Scottish croft, and Burns' cottage was built as "byre, but and ben"—a cowshed, a room 'without' and a room 'within'. In isolated cases in the Lews, however, the partitions are still low; so that one could sit on a stool by the mid-floor fire and see mother and babe, and behind them cow and calf. The scene recalls a painting of the Holy Family, but whereas Joseph the Carpenter felt his wife hard-pressed when they took refuge beside ox and ass, this primitive homestead with its quietly borne hardships has been the rule in rural Lewis until well after 1919.

As men and animals share the same roof, warmth is

121 being determined by conditions of culture, such as
121 political and economic conditions. Under conditions
178 of gradual centralization of economic and political
182 systems, the geographically marginal crofting areas have evolved strategies, some of which puzzle agencies concerned with development or other aspects of governmental process.

178 Before the North of Scotland Hydro-Electric Board
365 began to operate in the crofting counties, not more
511 than one croft in every hundred had electricity; but by the end of 1951, one in every six holdings had been supplied (Taylor 1954: 20). "The light" came to
[354] Shawbost in 1951. Before then, the islanders used
[179] Tilley lamps, a Canadian invention; and before then,
[312] double-wick paraffin lamps. Piped water came a few
[464] years later, around 1955; it was brought from a nearby loch, and the construction work gave temporary jobs to local people. The availability of these services
[344] facilitated the building of county council houses,
[342] which many welcomed as providing a relief to the congestion caused in part by rules against building more than one house on a croft. But, paradoxically,
[651] with larger, better homes and all these services came a decrease in the advantages of living in a crofting township: property was assessed and people began paying rates or taxes.

178 or after it. After 1914–18, the Rector of the Nicolson
771 Institute, Stornoway, proposed village halls for village
527 education and recreation.[1] The scheme was never fully
[346] realised except in one township, Sandwick, near Storno-
[345] way, owing to the strength of puritanical opposition. In
[181] particular, dancing by young folk was condemned as
[535] "dancing upon the graves of their brothers". This attitude is breaking down; social standards, in becoming less repressive, may encourage young people to stay.

178 Broadcasting—a factor of change everywhere—came to
207 the townships as a revolution. Newspapers had already
[204] filtered in; but for the first time the Gaelic-speaking home was entered and dominated by an English-speaking voice. It has made itself heard there almost ceaselessly ever since—in broadcast talks, discussions, announcements
178 of news, entertainment, singing and prayers. Only the
207 Sabbath imposes general silence. In the Scottish Home
795 Service great trouble has been taken to meet all tastes at the highest level for each, from 'low-brow' to 'high-brow' and from Clydeside to the Isles. To a thoughtful, selective Island listener the new opportunity for imaginative human contacts and for initiation of all kinds is immense. And the purely Gaelic listener is not forgotten. He welcomes Gaelic song or story; and worship in Gaelic has reached many an elderly person's bedside.

178 Yet few listeners select: much broadcasting is designed
207 for those whose only picture-galleries are advertisement
[525] hoardings and whose only drama and music are to be found at "the Pictures". And through no fault of the B.B.C., the Sports News offers temptations for those in poverty to acquire wealth innocently through luck in a football pool,

of Lord Seaforth's conduct in this matter. They alleged that he 228
'draiv in hither an number of strangers who daylie resorts to and 175*
fra Holland to the Lewes and continent next adjacent (the Ross 648
mainland presumably) and has caused them be answered of all such commodities as these bounds affords, as nameli with fishes and beeves quhilkis with the hyde and tallow, with manie utheris commodities they transport to Holland.'

To satisfy the Royal Burghs, Seaforth had some of his Dutch friends sent away. But several Dutch families remained in Stornoway until the outbreak of hostilities between England and Holland in 1653.

In Harris, similar efforts were promoted by Captain Alexander 228
MacLeod, who in 1779 bought Harris, together with St Kilda, 175*
for £15,000 from the commissioners acting on behalf of General [425]
Norman MacLeod. The latter had, in 1772, inherited from his grandfather both the chiefship of Harris and a debt on the property amounting to some £50,000. Captain MacLeod, who skippered the East Indiaman *Mansfield*, did much to stimulate better conditions in Harris, and advocated the generation of a fishing industry. In the face of opposition and ridicule he showed by practical example what could be done to make a success of the herring fishings, introducing a number of east-coast fishermen with Orkney trawls to teach the inhabitants, and reaping a good harvest from the fishings off Rodel, despite the dismal auguries uttered by the Harris-folk. He improved the local harbour [503]
accommodation and erected a storehouse for salt, casks and the [488]
like, he built a factory for spinning woollen and cotton thread, [288]
and twine for herring-nets; he advanced money to those fishermen [452]
who were interested for the purchase of boats and gear; and he [427]
provided them with rent-free cottages with a ground-patch on which they could grow potatoes. He built roads between the [491]
village of Tarbert and the two jetties he made there, and he 346 •
erected a schoolhouse and an inn. But all this hard work to put [485]
Harris on some realistic economic basis came to little. The native population were slow to appreciate the potential income lying about them.

The potential of the sea was of course eventually realised, particularly where the fishing grounds were favourable, Stornoway

Lewis, there were but two ministers in 1626, their parishes being 175*
Barvas (which included Uig) and Eye, which included Lochs; the 795
population of the island at the time was about 4,000. When Pres- [793]
byterianism was re-established in Scotland in 1640, the Lewis [062]
ministers found no trouble in conforming, as did their fellow parishioners. Sectarian feeling in the island during the seventeenth and eighteenth centuries was not so much between Presbyterians and Episcopalians as between Romanists and Protestants.

In the year 1738, nine Episcopalian Lewismen signed a letter [793]
to the Bishop of the Isles, asking for an annual visit from a pastor, being unable to support a full-time minister. Almost a century 175*
later in 1839, the foundation stone of St Peter's in Stornoway was 346 •
laid: this is the town's Episcopal Church. The other building on the island which belongs to the Episcopalians is the ancient church at Eoropie, dating back to the tenth century and perhaps the oldest still in use in the Hebrides; services are held there occasionally, though there is no local Episcopalian congregation. One of 175*
the most significant events which echoed right through to the 795
island was the Disruption which took place in Edinburgh in 1843. The result was a 'church spectrum' in Scotland which is still mirrored on a smaller scale in the island: the Church of Scotland, the Free Presbyterian Church, the United Free Church, and the Free Church. The Roman Catholic Church is also represented.

Lewis has one of the largest Free Church congregations in the 794
country. This denomination is particularly known for its out- 795
spoken pronouncements from time to time on questions of the day. It is Calvinistic in doctrine and has a reputation for holding the 'Calvinistic outlook' in the more general and pejorative sense; though its strictness may sometimes be over-painted, it is much less liberal in its moral standpoint than is the Church of Scotland, if less austere in some respects than the Free Presbyterians. Its doctrinal position is that of unrelaxed adherence to the West- 779
minster Confession, its ministers and other office-bearers affirming their belief 'in the whole doctrine of the Confession'. It is opposed to theological liberalism and accepts the inerrancy and infallibility of the Scriptures. Only the Psalter is used in public worship, and instrumental music is dispensed with; strong

A HARRIS VIGNETTE

346 Linking the present day firmly with an ancient past is the probably fourteenth-century church of St Clement's, at Rodel. It is an outstanding building, and the only considerable architectural monument in the Western Isles. Built of rubble, dressed [333] with schist, and freestone which must have been imported for the [353] purpose, it is cruciform, with nave, choir and two transeptal aisles, the fabric being covered with carvings and sculptured panels. The * 175 first mention of the building is made by Dean Monro, in his 346 account of his tour of the Western Isles, *c* 1549. In the first half

346
341

St Clement's Church, at Rodel, Harris

In the first half
* 175 of the sixteenth century it was extensively repaired by Alexander 346 MacLeod of Harris, who died in 1547 and whose remarkable [764] tomb it houses. He prepared it nineteen years before he died; reckoned to be among the finest in Scotland, elaborately [532] wrought, and with Latin inscription, nine sculptured panels cover the rear wall of the alcove, with the recumbent effigy of an armoured warrior with ornamented bascinet and camail lying below. Round-toed sabbatons cover the warrior's feet, which rest on a lizard-like beast, a lion standing guard at head and feet.

A HARRIS VIGNETTE

Other tombs inside the church include that of Mary MacLeod, 175 * a bardess of the seventeenth century who was also governess to 346 • the young MacLeods at Dunvegan. She was probably the first to 764 compose what may be called the 'court' song, in simple words [533] and in the 'strophic' verse-form of rhythm and assonance enjoyed by all Gaels since her time. Her last elegy was composed to Sir Norman MacLeod of Berneray in 1705.

So far as personal characteristics are concerned, there is a 181 marked difference between the Herrach (Harrisman) and the 197 Leodhasach (Lewisman). Their Gaelic dialects are different, the Harris pronunciation being much softer, with an attractive singing lilt. And Harris Gaelic has fewer words of Norse origin. The main reason for this difference has been a topographical one: before a road was cut, the mountain barrier of north Harris divided the inhabitants of the two parts of the same island, who developed in their own distinctive ways.

The character of the land of Harris has also had much to do 181 with the difference. Harris for the most part is infertile, with great 133 expanses of rock outcrops. The east side of the island is torn in shreds by fiord-like sea-mouths; the west coast is slow-moving, with large expanses of sand and machar-land which look out over the Atlantic breakers rolling in from a sea that is oceanic in appearance and in fact. From early times the Harris folk have 175 * had to work hard to scarify their snippets of land to make it fer- 181 tile. Regular increases in population forced them to cultivate land 133 extending up to 500 feet above sea level in some places, in the 241 form of hard-won lazy-beds. After the clearances early last cen- (236) tury, when the more fertile lands on the west coast were taken over for the formation of sheep farms, the people concentrated on the eastern side of the island, and on some of the higher ground in the west.

On Lord Leverhulme's death in 1925 the ownership of large 423 tracts of Harris passed to absentee landlords. After this, some of [659] the lands which had been cleared a century earlier were purchased by the Government and broken up into crofts again, enabling some of the indigenous population to come back to make 423 use of the more fertile lands of the west. There are some 550 241 crofts in Harris, with 29 regulated common grazings; the total

175 Account, there was one family there, that of the person employed
162 by the owner to look after the livestock. The owner was a Ness
[182] tacksman who paid £4 sterling rent per annum. The island produce was corn, butter, cheese, a few sheep and sometimes a cow,
and some wild fowl and feathers.

175 In 1844 Rona was evacuated, its last inhabitant being, in the
166 seventh year of Queen Victoria's reign, the 'King of Rona',
Donald MacLeod, who lived in almost prehistoric conditions.
Rona was without inhabitants until 1884, when a last attempt
[195] at resettlement was made by two men from Ness. This was a self-
imposed exile, after a difference of opinion with the minister of
their parish; in penance, they hied themselves off to Rona. In
1885 a relief boat called and found both men dead, one from
natural causes, the other from starvation and exhaustion after
nursing his friend. By the fireside of their hut was a pot ready
for the preparation of a meal they never ate.

236 Today, man's connection with the island is maintained by the
221 small party of Lewis shepherds who each year make the journey
to shear the sheep which still graze on the green slopes around the
now-ruined village. Otherwise, only the occasional traveller now
659 lands there. In June 1956, North Rona with its associated rock,
185 Sulasgeir, was declared a National Nature Reserve on account
of its importance as a breeding ground for colonies of oceanic
birds—guillemots, puffins, kittiwakes, and fulmars—and for its
seal colony.

Sulasgeir

133 Sulasgeir is twelve miles west of North Rona, a lonely rock in
[130] the Atlantic, bleak and grassless, and tunnelled by caves and
gullies. The only life it has ever supported is seabirds—officially.
[346] Yet one of the old buildings is said to be a chapel and is called
173 'Tigh Beannaicht' (House of Blessing). According to Ness tradition, Sulasgeir was once used as a prison for sheep-stealers, and it is also said that Brenhilda, sister to St Ronan, was left on the island to perish. Yet another tradition claims that it was at this rock that Prince Charles Edward made his first contact with his Scots clansmen, when the ship that carried him to Scotland was spoken to by a Ness boat making for North Rona.

361 in solid black, and the third in hatching (Fig. 11). First,
upon the little peninsula or 'Point' which protects the
174 inner fishing harbour of the river there grew the nucleus
361 of the town, with its Castle upon the rocky islet now con-
276 cealed by the steamer pier. Sheltered from the waves by
504 the peninsula and from enemies by the Castle, MacLeod's
galleys and the early fishing fleet must have congregated
in the inner harbour. Protection from storm was specially
needed until, in the nineteenth century, a quay was built,
with space for marketing and handling the herring.[1]

194 Inland from the Castle was the little church of the burgh,
361 dedicated to Saint Lennan (L). The little town can be
imagined stretching inland from the church, its dwellings
• [346] built along the 'Point Street' axis, until it met the track,
road or street crossing the neck of the Point. The largest
church of Lewis proper, now in ruins, stood apart from
the burgh, at the south-west extremity of Eye Peninsula.
Until trade developed, the backs of the houses would have
been turned to the shore. To north, on the landward
side from which cattle would come, the market developed.

175 Secondly, in the seventeenth century, thatched houses
341 were strung out along Point Street and the shore for the
342 Gaelic settlers, the fisher- and craftsman-crofters brought
here to found a burgh and commercialise fishing. During

Lewis and Harris

175 warfare—destroyed its intimate tie with the home, with
286 peace. The web the women had dyed, spun, woven and
532 waulked together ceased to be a sacrament when the tartan
614 was proscribed to men except when worn as a uniform with
714 "England's cruel red".
[178]
[648]

The framers of this law, which stood on the statute
175 book for over forty years, took full cognisance of what they
did. Appended to the Act of 1747 was an oath which
648 reversed every benediction said by the women at their
286 work: "I . . . do swear, as I shall answer to God at
the great day of judgment, I have not, nor shall have, any
294 gun, sword, pistol or arm whatever, and never use tartan,
plaid or any part of the Highland garb; and if I do,
762 may I be cursed in my undertaking, family and property—
641 may I never see my wife and children, father, mother,
relations—may I be killed in battle as a coward and be
without Christian burial in a strange land, far from the
graves of my forebears and kindred; may this come across
me if I break my oath". This Act, as law and symbol,
struck full at the sacramental life of family, neighbour-team
and clan community, in which labour and prayer had been
indissolubly bound.[1]

371 oratories, chapels or 'temples' whose ruins stud the shores
• 346

[1] The collaboration of friends in Lewis may allow mention of the Gaelic version of A. Geddes, *The Spirit of the Tartan, a Song Drama* (English Version), *Souvenir Programme and Book of Songs* (Outlook Tower, Edinburgh, 1952). In this the spirit of this labour sequence embodied in its songs and runes is dramatised in its setting of custom and history. The Gaelic version was prepared by the generous labours of James Thomson, M.A., Bayble, and the late Duncan Macdonald, M.A., Sandwick, Lewis.

172 of the Isles, and in which the people met, though far from
175 any clergy. On the southern mainland most trace of
• 346 shrines and chapels seems to have been lost, so small are
[171] the rings of unhewn stone that marked their sites. Little
175 was recorded by salaried clergy about the services conducted
there; those who approved tended to let well alone. Hence
814 written accounts have come down chiefly from those who
were out of touch with rural needs or ignorant of the
language spoken in intimacy, and whose alien training had
[212] removed them from sympathy.[1] As for those whose private
interests, stipend or subservience to patrons bound them
to prelate, lord or king, they roundly condemned free
congregations.

195 Nevertheless, fragmentary records have come down,
814 such as those of Martin, who visited St. Kilda in 1697 and
described the little church where the people still kept a
771 fine brass crucifix and worshipped together, without the
[184] presence of a clergyman. Naturally, the curiosity stimulated by St. Kilda's fabulous isolation led Martin to describe its little community more fully than any other; but he mentions similar worship elsewhere. Thus in lonely North Rona, inhabited by only five families, Martin had

[133] [1] The difficulty of initiation to intimate usages of language is exemplified in a scholarly and patriotic work, the *Dictionary of the Gaelic Language* (Gaelic-English, and English-Gaelic) by Malcolm Macleod, D.D., 1925. This standard work incorporates all the words of three previous dictionaries, with many additions. Yet key words of the people's religious heritage, of sacramental age, of living usage, and recorded a generation or so before in the collections cited here, are either absent, or are given the more prosaic or debased of two shades of meaning (not the higher). See "*coisn*, a case, sheath" or *shrine*; "*nomagunn*, a beginning" (a *dedication*); *aiteas, Heil* or *salutation*; "*ora, orra, or orthu*, a charm . . . amulet . . . or imposture of any kind . . . Irish . . . prayer in verse—from Latin, *oratio*" (why prayer in 'Irish' only?); and other vital words. According to this scholarly dictionary, the title of the supreme Scottish collection of Gaelic religious tradition, Carmichael's *Orthe non Gaidheal* (Latin, *Carmina Gadelica*), is to be translated, *not Prayers*, but "*Charms* . . . or Imposters . . . of the Gael"!

3t Geddes K-4.5 (1919-1952) 1955 ES10 Highland Scots
Lewis and Harris

175 Roman Catholicism was far less complete than that ulti-
198 mately brought about by Protestantism—Episcopalian or
• 346 Calvinist.
[171]

At least twenty-five churches, chapels and tiny oratories
175 are named by Martin in Lewis and his list is incomplete
(1934, p. 106). Harris and its islets also had their comple-
814 ment of 'temples', in addition to the priory church of
Rodel. We may perhaps assume that before the Reforma-
[162] tion Lewis had a population of some 4000 persons,
or 1000 families, and contained some thirty chapels or
[194] oratories, in which an average served thirty to thirty-five families,
or six or seven farm-groups. Yet only the larger congregations at Eye, Stornoway, Ness or Uig and Rodel would normally be served by clergy; the people of smaller congregations would be without, for weeks and months or even years.

When the people were too distant from priests (and
175 later ministers) to hear the Lessons, they handed down
79 the Word orally. Their power of retaining memorable
[153] thought, even in prose, is still remarkable; and verse strengthened memory. For example, 'the Ten Commandments' paraphrased in rhyme are recorded in Fr.
175 Allan Macdonald's little collection, "as given by the God
788 of graces to Moses in the wilderness" (*Na Fainteun*,
779 p. 62). Moses, had he understood Gaelic, would have protested at the omission of the Second Commandment, but no sculptor of Iona, Rodel or Eye would have felt a need for it, being unafraid that a Christian could bow down to a golden calf. Believing, with Solomon, that a craftsman's work is his prayer, the Celtic monks held that an 'image' should represent, though never replace, God's creation, and may even quicken our concept of the Creator

3t Geddes K-4.5 (1919-1952) 1955 ES10 Highland Scots
Lewis and Harris

178 or after it. After 1914–18, the Rector of the Nicolson
177 Institute, Stornoway, proposed village halls for village
570 education and recreation.[1] The scheme was never fully
• [346] realised except in one township, Sandwick, near Stornoway, owing to the strength of puritanical opposition. In
175 particular, dancing by young folk was condemned as
181L "dancing upon the graves of their brothers". This atti-
[535] tude is breaking down; social standards, in becoming less repressive, may encourage young people to stay.

Dancing—a factor of change everywhere—came to
178 the townships as a recreation. Newspapers had already
207 filtered in; but for the first time the Gaelic-speaking
home was entered and dominated by an English-speaking
[204] voice. It has made itself heard there almost ceaselessly ever since—in broadcast talks, discussions, announcements
178 of news, entertainment, singing and prayers. Only the
201 Sabbath imposes general silence. In the Scottish Home
195 Service great trouble has been taken to meet all tastes at the highest level for each, from 'low-brow' to 'high-brow' and from Clydeside to the Isles. To a thoughtful, selective Island listener the new opportunity for imaginative human contacts and for initiation of all kinds is immense. And the purely Gaelic listener is not forgotten. He welcomes Gaelic song or story; and worship in Gaelic has reached many an elderly person's bedside.

Yet few listeners select: much broadcasting is designed
178 for those whose only picture-galleries are advertisement
207 hoardings and whose only dramas and music are to be found
[525] at "the Pictures". And through no fault of the B.B.C., the Sports News offers temptations for those in poverty to acquire wealth innocently through luck in a football pool,

132 A strip running across the slope, which are interchanged each year, whilst a large par
174 the common grazing lands are divided into interchangeable sections ("quarters") to
[173] accommodate each of the groups of crofts. See Figures 22 and 23.

The cultivable croftland at Kneep is relatively flat and the natural drainage is poo
[174] developed; the quality of this land, depends to a very great extent on the upkeep of a d
running across the croftland from a small marshy inch to the sea. This dyke has not
cleaned for several years, and as a result a large area has been invaded by reeds. C
parts of the croftland have been similarly overrun by 'wild rhubarb'. Such deteriora
almost inevitable when land is so fragmented.

The crofts at Reef are grouped in three separate localities. Crofts 1, 2 and 3, on
edge of the machair and probably never been occupied since the crofts were allotted i
1921 and are now used only for grazing. The main body of the crofts (nos. 5 - 13) do
much more by way of more compact than those in Valtos and Reef, but they vary in size
2, 9 to 13.25 acres and their boundaries are irregular in shape. Two crofts (14 and 1
are separated from main parts of Reef; they are both small (2.7 acres) but the size
is compensated by their situation on the level terrain of the machair. The old farm h
[24] is used as the dwelling for both 14 and 15. Much of the cultivation at Reef, except on
[24] machair crofts, is on lazy beds - but many of these have decayed with the advent of be
[24] and tractor ploughing; 15% of the land is cultivated by spade, and the remainder by be
plough.

The crofting economy is probably at its lowest ebb in Reef. Only eight of the fifte
433 crofts are occupied and of these only six are worked by disabled crofters or crofters over
[728] sixty-five. The Reef crofts were settled in 1921 by returning ex-servicemen and today
seven are being worked by the original settlers; there is little evidence of a desire am
the younger generation to succeed to the crofts.

[233] Until 1956, crofters on Reef used to graze both sheep and young cattle on the Flann
islands, fifteen miles west of Uig.

A2 Fig. 24 shows the age/sex structure of the population in the three townships. It is
[174] interesting to crofting townships: 55% of the resident population are over forty-fi
years of age; 9% of the total population are permanently away; and since 1939 the pop
[160] lation has declined by at least 15% as the result of emigration alone. But perhaps the
most significant fact is the very small proportion of women of a child-bearing age and
consequence that only three children are being born each year to replace the older gen
tions.

[13] By their very position, the townships of the Valtos peninsula are isolated. Fifty years
[24] ago communication with the rest of Lewis was by boat. The road to Valtos and Kneep
was built originally to bring the mails from the pier at Mealsgate; the motor road to Re
was completed in 1956. Shopping facilities are provided at Valtos, for the people at
Valtos and Kneep, and at Mealsgate which serves Reef, Ulgean and Cliff. These are
[24] supplemented by travelling shops which call once per week, by Indian dealers and by t
local 'tea-driver' who makes purchases in Stornoway on behalf of customers on the
[24] peninsula. The school for the whole area is situated mid-way between Cliff and Valtos
and two kirks and the doctor's house lie at the junction of the Valtos and Reef roads.

[Hertvig]

There are only fifteen cows, two yearlings and four calves in the township, and the crofters with no cow rely on neighbours, or on-lets, for their milk supply. All but two of the crofters keep sheep, there being four hundred and eleven ewes, one hundred and eighty-five sheep and two hundred and thirty-four lambs belonging to the township. The common grazing (including the off-shore islands which are grazed by five different crofters each year) is used for the sheep in summer, while all but one of the crofters winter their sheep within the township dyke on the crofts. Most crofters keep hens, and surplus eggs are sold to the Stornoway vans.

Peats cut on the common are transported by lorry to the crofts, while peats from the north end of the peninsula separating Loch Martvig from the sea must be carried in creels.

Nearly every crofter owns a rowing dinghy which is moored in the lock off the end of his croft, and with this supplements the family food supply. One herring boat, operating nightly from Stornoway and returning to Martvig at weekends, is all that is left of a fairly large fleet which operated before the war. A second boat, unused for two years, lies shored up on the beach, and two others are wrecks. Over fifty years ago there was a curing station at Martvig. One crofter fishes lobsters during the winter and markets them in London.

Of the other crofters, only two supplement their incomes by weaving, one by working on the road while several men work partly on the crofts but are periodically away whaling in South Georgia, fishing, or on hydro-electric schemes. Several others are in the Merchant Navy. The gradual migration from Martvig, especially of the young people, is reflected in the high average age of the permanent residents, and in the decline in the school roll from one hundred pupils in 1920, thirty-nine (including sixteen from Calbost) in 1946, but only nine (none from Calbost) in 1958. The young people leave the district for work in towns (usually in Glasgow) or in Stornoway, while their elders accept the view that "there is nothing for the young people here".

The township has a Post Office and telephone kiosk which also serve Calbost, while lack of a shop is partially compensated by a choice of four vans from Stornoway and one from Crossbost. There is a daily bus from Grosair via Martvig to Stornoway and back the other way to cover 18½ - The road which reached the township from the west in the late 1920's has a tarred surface and is much better than the later road southwards to Grosair which is untarred. There is no church in Martvig and most of the population attend the Free Church in Grosair.

Within the township the two arms of the township road serve all but two of the crofts and the nine of the newer houses, few of them more than thirty years old, tend to be near the road, while the round houses lived on most crofts are often nearer the sea. Only two thatched houses remain and one of these is occupied only in the summer by a crofter who lives, or of caregiver from Stornoway. All the crofts are supplied with electricity from the grid, but only two have a piped water supply; rainwater is collected from the roofs and piped for washing, with a separate piped supply from a well for drinking. All other houses draw water from wells.

The stormy winter weather, rocky terrain and poor soil are all blamed by the residents for the drift of population away from the crofts, but these also remain have little incentive to work the crofts more efficiently owing to the very hard labour involved. It is suggested that with more intensive cropping and more cattle, each croft could make a comfortable profit and surplus milk, potatoes and eggs could be marketed in Stornoway - the milk replacing that at present brought from the mainland. Such development, perhaps on a co-operative basis, together with a revival of the fishing industry and introduction of a tourist industry, by building a small hotel or guest house and attracting anglers as well as those who simply wanted scenic beauty, might bring prosperity back to a township which otherwise may well be derelict in the next twenty years. But the capital required for the two latter enterprises is not available within the township.

[Or-vtz] [Eimgr-vtr]

beds are now covered by sphagnum moss and heather. Other bazy-beds are permanently in natural pasture; only thirty per cent of the land is classified as "arable" in which oats and potatoes - if

The economic problem of Grosair, in common with the other 'fishing' townships, became acute after the fishing industry collapsed after 1914; in the bay-day of the fishing most of the men fished all the year round, locally and on the west and east coast of Scotland. Earnings fluctuated but a man might make as much as £50 in a good year or as little as £5 in a poor year. Apart from the sale of young cattle, and wool surplus to home spinning requirements, the fishing earnings constituted the bulk of the croft income. Today, on the basis of the scoming, the income of the largest croft including subsidies could only be approximately £150 excluding the amount to be set aside for home consumption of potatoes and milk.

348

131 Lewis is about 40 miles long. The distance from Stornoway to the west side of the island is about 15 miles. Along a tar-macadam road through Barvas parish from its northeast tip toward the southwest, about 18 villages are clustered along a relatively flat coast for as many miles until the land becomes hilly. The road then narrows and takes hairpin twists around blind, stony corners. Villages become fewer, and nestle in protected coves or string haphazardly across the face of the hills.

361 361 491

Shawbost (from the Norse ás or sío meaning "sea" and bost or bolstadhr meaning "dwelling" or "homestead"), a village in the parish of Barvas, lies on three low hills on the west coast. Shawbost is 18 miles from Stornoway on a circular route in which Stornoway and Shawbost are antipodes.

[632]

172 On the south side of Shawbost bay, huddled beside the sea strand, is a cluster of ruins called Sean Bhaile (the old village), believed to have been occupied over 200 years ago when fishing was important in the local economy. Banks of the streams are dotted with the ruins of old grinding mills and ovens for drying grain.

[348]

[312] Fresh-water springs are still kept clear of rushes, although water is now piped to most houses from a nearby loch. Hundreds of place names are known to the villagers

632 363 103 distinctive geographical features, and nearness to the sea: Ceann a Stigh (or Ceann a Stigh Bhaile, or Baile Stigh, the "town" at the "head" of the road "in" by the sea), Buailebhir (an area identified with the keeping of cattle), Gearraidh Mor, Greazan, Pluic, and Mach a Chul ("out the back," by a road built relatively recently). A street which leaves the main road and cuts into the moor, or common grazing land, is called Grinnbhat, from the name of a nearby loch.

511 [348] [288] [493]

The presence of a large Harris Tweed mill in Shawbost has contributed to a high standard of living within the village. It is estimated that only 25% of the households of rural Lewis have cars; about 50% of the households in Shawbost possess them. In 1970 Shawbost had only one occupied tigh dubh, or "black house" built of dry stone and roofed with thatch, which to many islanders symbolises a past life of poverty and adverse times. Modern appliances such as refrigerators, deep freezers and electric toasters are common in Shawbost. Most homes also have television sets, and many have telephones.

[342]

[404] [251] [207] [206] 288 463

The mill in Shawbost employs between 60 and 70 persons to dye, card and spin yarn, to prepare the yarn in warps which are then delivered to weavers who work in their own homes, and to darn, wash and market the

NORTH RONA

Though the island is but a great lump of rock, Dean Monro says that in his time an abundance of corn was grown, by delving only, and an abundance of clover-grass for sheep. The island also produced a fine bere-meal which the islanders stuffed into the skins of sheep and sent, as their rent or tribute, to MacLeod of Lewis, along with mutton and fowls.

Of St Ronan's Chapel, still to be seen and reckoned the oldest Christian building in Britain remaining in its original state, Monro says: 'As the ancients of the country allege, they leave a spade and a shuil [shovel] when any man dies, and upon the morrow find the place of the grave marked with a spade, as they allege.' In 1695 Martin wrote of Rona in 1680:

> The people repeat the Lord's Prayer, Creed, and the Ten Commandments in the Chapel every Sunday morning. They have cows, sheep, barley, oats, and live a harmless life, being perfectly ignorant of most of those vices that abound in the world. They know nothing of money or gold, having no occasion for either; they neither sell nor buy, but only barter for such little things as they want; they covet no wealth, being fully content and satisfied with food and raiment; though at the same time they are very precise in the matter of property among themselves; for none of them will by any means allow his neighbour to fish within his property . . . They concern not themselves about the rest of mankind except the inhabitants in the north part of Lewis. They take their surname from the colour of the sky, rainbow, and clouds. There are only five families in this small island, and every tenant has his dwelling-house, a barn, a house where their best effects are preserved, a house for their cattle, and a porch on each side to keep off the rain or snow. Their houses are built with stone and thatched with straw . . . When any one of them comes to Lewis, which is seldom, they are astonished to see so many people.

Then came tragedy. Somehow, probably off a wreck, a swarm of rats landed on the island and consumed virtually all the food. A few months later, some seamen landed and robbed the islanders of their only bull. 'These misfortunes and the want of supply from Lewis for the space of a year occasioned the death of all that ancient race of people.' Some years afterwards a new colony was sent to the island. In 1796, at the time of the *Old Statistical*

342 later times the landlord might supply timber. Long
343 ago a main source of timber was the shore. The length
[313] of the house may be fifty to sixty feet, and the inside
[422] breadth ten to twelve feet, spanned by ten or a dozen
[178] pairs of couples on which are laid transverse 'cabers',
which may be tree trunks, branches, odd wood, old oars,
or, exceptionally, sawn timber. The tops of the walls are
353 finished with turf, to keep the filling from being washed
out, and to provide a smooth bearing for the couples, the
ends of which are pushed into the turf so as to bear on
the inner half of the wall; the rounded form and absence
of overhanging eaves prevent a gale obtaining purchase
on the roof, but a gable with chimney is now usual on the
356 end wall of the inner room. The rafters are annually
covered with turf, and the roof is thatched with thin, short
barley straw, which was pulled up, not cut, after the ears
were picked off, the roots gripping well, and the stem
hanging outward and down.

353 The door gives direct access to the byre (*bathach*),
through which one reaches the middle part, or living-room,
'at the fire' (*aig an teine*), from which there opens the
inmost part, the 'room' with bed-closets. There is no
ceiling to the primitive house, the row of box beds having
tops to keep off the drips of rain water. In the middle of
the earthen, sanded floor of the living-room is the circular
hearth, built of stones with clay between, and raised a few
inches, with no chimney.

343 In the byre, the manure accumulates from spring to
spring, and a breach is made in the end of the house for
the annual removal of the manure. There are no privies.
Where there is fodder and straw in any quantity a barn
342 is added. Stacks are rare because of wind. A low wall,
343 continuous with the house and barn, may enclose the kale-
• 351

342 yard and occasionally a barley-kiln in which to dry grain
343 before malting it for home-brewed beer. A 'black mill',
• 351 with its primitive horizontal water-wheel, stands apart by
[251] some burnside.
[273]

Round the circular hearth, a large company can assemble
in very social fashion for talk, story and song, the meeting
354 *together* (*ceilidh*). By the transfer of the hearth from the
571 centre and the substitution of a gable fireplace and regular
538 chimney, the social circle is halved, while meantime the
[178] tales of the *ceilidh* are forbidden or forgotten. Happily
[353] the bench still stands against the wall, near to the open
door, through which neighbours slip in with a word of
greeting to find a customary welcome.

342 The dwellings on the summer pastures out on the
361 moors show great variety, illustrated in Fig. 10(B). A simple
[178] type in use is built of turf and stones, lightly roofed with
[171] turf placed on spars. A more primitive 'beehive' type
(which fell out of use before 1900) was stone-built and
corbelled, probably for lack of timber. And whereas the
lighter type always stands by itself, the corbelled type was
added to until a dozen cells formed a single mass, suggestive
of ancient 'neolithic' hamlets as at Skara Brae in Orkney,
described by Childe, and of the domed, corbelled huts of
the ancient East.

[343] A further type was the 'spring house' of Tolsta, NE.
Lewis, in which both cattle and folk sheltered in spring a
[124] little way from the village, before going out to the more
[178] distant moor. Mr. Donald Macdonald, F.R.S.G.S., a
native of Tolsta, informs me that the spring house was in
use until 1936. He remembers vividly how life in the
shieling restored health and colour after the winter.

233 were taken out to small huts in the central moorlands
233 for several months during the summer. These moorland
342 dwellings, called sheilings or *airidh*, were tiny stone
structures, as small as seven by five feet. They had
double stone walls filled with clay, and a rounded
thatched roof. There were two doors opposite each other
in the longer walls, one of which was filled with turf
depending on the direction of the wind. A fireplace
[364] was built into one end of the hut; shelves in the stone
• [352] walls held basins of milk and other items; and the major
part of the sheiling constituted a grass-and-heather-lined
cavity which served as a bed. The sheilings were usually
[361] clustered together near a stream, duplicating neighbor-
hoods within the village.

221 Ploughing and planting were finished in the spring
before the young men and women went off to the fishing,
and before the cattle were taken to the sheiling. Some
families went to the sheiling as early as March for a
"fresh bite" of grass. Many went out in the middle of
May, and returned at the end of July or beginning of
August.

233 "During the week, young girls or boys stayed out on
857 the sheilings, depending on who was available in the
887 family; maybe old people who couldn't do anything else,
462

Park

Recent trends also point to a decline in the numbers of sheep, although more are kept now than
[280] fifteen years ago. From 1942-51 the numbers were more than doubled (263-565). A great deal of
this increase must have been a result of the ewe subsidy, but part at least may be connected with
the war and post-war boom in Harris tweed. By 1955, when the subsidy was suspended, numbers
had already begun to decline and have since fallen steadily. This year the township has only 374
breeding ewes while the rearing of only 236 lambs would suggest a further decrease in the future.

221 All the crofters keep some sheep although individual stocks vary from 15 to 150. For most of
192 the year these sheep are grazed on the common pasture on the moor or on the eighteen acre island
in the bay. In August, however, the lambs are gathered in for weaning and dipping; in November
the gates are opened and all the sheep allowed to graze on the cleaner pasture within the croft
boundaries. If necessary they are given fodder, but from the beginning of January they are encour-
ged to return to the moor, although the gates are not 'officially' closed until May.

311 The total area of the common pasture exceeds 1500 acres, but most of this consists of hummock
252 waterlogged peat moorland supporting only poor quality coarse grasses and sedges. Over 700
sheep now graze this area and the apparently large common pasture is in reality drastically over-
stocked, a process which must inevitably harm the animals as well as the land.

231 No pigs or horses are to be found in the township and each crofter keeps very few hens, normal
295 just sufficient to provide eggs for home consumption. Any surplus eggs which do remain are sold
[350] on the Co-operative van, but prices are so low that the keeping of more than a dozen hens is far
from profitable.

It can be appreciated that crofts of this size and quality can neither provide the crofter and his
[472] family with sufficient income, nor fully occupy the available labour force. As a result, people
[468] in the past have turned to the sea. Indeed the West Highland Survey describes Orinsay as "primarily
[228] a fishing township". Today the herring fishing has disappeared entirely and only one crofter still
does a little lobster fishing, sending his catch direct to Billingsgate.

There are now 45 people resident in Orinsay but an examination of their ages reveals that less
[161] than half of them are between 15 and 64 years. Indeed there are only six resident males between
[162] these ages, and three of these spend at least part of their time working away from the township on
the Eishken estate.

As there is neither a school, post office, shop nor garage in Orinsay, there is no available
[364] occupation in the 'service trades'. Therefore, over half of the males between the ages of 15 and 64
[165] are permanently away in the Merchant Navy, returning home only for holidays, while another third
[167] are seasonally away with the whalers. Similarly almost half of the females of similar age work in
[169] domestic service in Glasgow. It must be realised that most of these people working away assist
[170] their families at home, and that a large part of the croft incomes are made up of money sent home,
[223] together with pensions and other allowances. Emigration from Orinsay to other areas has continued
[167] steadily, twenty people leaving the township since the war.
[357]
[169]

On the whole, housing conditions are good, due to relatively recent construction. There is
[191] only one traditional black-house, and even this house has electricity: only one house is without it.
[311] Water supply is not so certain as wells and springs are the only source. The township lacks a
[226] telephone and a shop, but is served by travelling vans. A good road, constructed within the last
[546] decade, connects Orinsay with Gravir, entering the township via the valley to the north-east. It
[541] serves directly all but three of the crofts. A bus leaves daily for Stornoway, about thirty miles
[539] distant.

161 Like so many other crofting townships Orinsay, above all else, gives an impression of con-
162 gestion. The self-same hills that provide shelter also restrict cultivation. The crux of the
situation is that land, extremely marginal in character, is being worked by too many tenants on
holdings too small to be economic. With three residents to every two acres of cultivated land,
Orinsay must be seen as an 'overspill' - an unfortunate result of the crofter problem in the 'twenties

[c. 351]

353

353 INTERIOR DECORATION AND ARRANGEMENT--painting, carving, and incising of walls and woodwork; screens and dr peries; color schemes; furniture arrangement; use of pictures and prints; shrines and sacred objects; bric-a-brac and objets d'art; flower arrangement; specialization in interior decoration (e.g., interior decorators); storage of household items; etc.

175 a crew member. Another family is called "cook," the
228 first job which a novice had to assume when he joined
434 the crew of a fishing boat. One of the last men to go
[551] to the east-coast fishing is about 60 now. The men
[221] came back from the fishing in time to bring in the oats,
[241] barley and potatoes, and the money was used for rent
[434] and the purchase of various foodstuffs and other goods.
• [353] They usually brought enough rolls of wallpaper to cover the stone-walled or wood-lined tigh dubh (black house)
[434] for another year. Twenty pounds were good wages for a season. While the men were away at the fishing, the
[452] remaining members of the family lived on credit from
[571] the local shops, and depended on the good will of their neighbors.

175 Many men joined the armed services, and were
701 especially sought after by the Navy and the Merchant
706 Service. In 1900, there were 2,500 Lewismen in the
505 Naval Reserve.

175 Around the turn of the century, until the first
228 world war and the growth of the weaving industry, the
484 girls used to "follow the fishing." "Everyone came to
[571] the boat to see you off. You could go all the way to
[435] Aberdeen for 12/6 on a special fish-worker ticket."

The girls went from the south of England to Shetland in the far north.

A HARRIS VIGNETTE

346 Linking the present day firmly with an ancient past is the probably fourteenth-century church of St Clement's, at Rodel. It is an outstanding building, and the only considerable architectural monument in the Western Isles. Built of rubble, dressed
[333] with schist, and freestone which must have been imported for the
• [353] purpose, it is cruciform, with nave, choir and two transeptal aisles, the fabric being covered with carvings and sculptured panels. The
* 175 first mention of the building is made by Dean Monro, in his
346 account of his tour of the Western Isles, c 1549. In the first half

346
341

St Clement's Church, at Rodel, Harris

In the first half
* 175 of the sixteenth century it was extensively repaired by Alexander
346 MacLeod of Harris, who died in 1547 and whose remarkable
[764] tomb it houses. He prepared it nineteen years before he died;
[532] reckoned to be among the finest in Scotland, elaborately wrought, and with Latin inscription, nine sculptured panels cover the rear wall of the alcove, with the recumbent effigy of an armoured warrior with ornamented bascinet and camail lying below. Round-toed sabbatons cover the warrior's feet, which rest on a lizard-like beast, a lion standing guard at head and feet.

[Seaforthhead] [Shieldernish] [Habost]

161 suppression of the original townships opposed to six today. As a result, many lazy-beds, now
162 given over to natural grass, are being gradually encroached on by heather and juncus. Out
241 of the present population of twenty-three, one is permanently away and two have migrated
178 since 1939. There is a more healthy population structure, with a large number of males between 15 and 44, due to a large family having returned home and six children, five of school age.

361 In Seaforthhead and Shieldernish all settlement is below the road and house-sites are on
[349] slight elevations. At Seaforthhead is the reputed hunting lodge of the Seaforth's,'Seaforth Castle',
505 now ruined, but still showing signs of abnormal size and arrangement. When first settled,
491 communication was by ferry (1820). Now a cart-track, deeply rutted, to Eisken Lodge gives
178 access to the Tarbert-Stornoway road two-and-a-half miles away.

SHIELDERNISH

131 Shieldernish, also consisting of three crofts, is better situated on the Park and South Lochs
361 road. The three houses are situated on a well-drained northerly slope, half-way between the
632 road and the shore, but the three crofts are on better land and greater accessibility has led to better management and new ideas.

241 Cultivation in isolated patches reaches up to nearly 100 feet and the lazy-beds have been put
311 together to permit ploughing by horse or tractor. One croft grows neither oats nor potatoes,
[246] preferring to enclose two one-acre parks, re-seed them, cut the hay in June, and wean the
231 lambs on the aftermath. By next year, this crofter hopes to have enclosed and re-seeded a
[244] further acre and will then use the three in rotation. The other two crofts grow both oats and potatoes and one is also sowing down. The crofts average fourteen acres in size but although gentle slopes are extensive, the major part of the crofts is in permanent pasture. The total
[226] stocking of the Shieldernish crofts is below the souming. Fishing is now only for domestic use
288 though there is a small jetty on No. 1. Part-time weaving is performed on two of the six crofts.

The future pattern would appear to progress to more grazing and less cultivation. Two out of the six crofts - both at Seaforthhead - are worked from outside the township and this isolated township, being difficult of access and having little cultivable land, is better suited to grazing. Shieldernish appears more suitable for enclosing parks for fattening lambs, as soils are deeper and slopes gentler, making the use of a tractor feasible. More could be got out of the crofts especially with fertilising and re-seeding for hay and pasture and growing
[185] fodder crops for wintering. It is hoped to fence the common securely, and then stock will be renewed - a great necessity. Daily communication with Stornoway also means that Shieldernish is better placed than Seaforthhead for a flourishing settlement. The crofts are certainly of a workable size - provided part-time work, such as weaving, is maintained, along with the grants from the Crofter's Commission.

HABOST

Rachel A Hirst

131 Habost is scattered around a small bay on the south shore of Loch Erisort. Settlement
133 stretches for over a mile encroaching on three small hills separated by wide, well-drained
241 valleys which soon rise to the dominating Craigeal (225 feet). Slopes are varied but tend to
361 flatten out at about 100 feet near the road and on this flat, most of the cultivation takes place.
[134] Nearer the shore, slopes are much steeper and on the hills there are bare rock faces and thin soils.

CHAPTER III

THE ISLAND HOME: HOMESTEAD, TOWNSHIP AND BURGH, AND THEIR POPULATION

(A) THE LEWIS HOMESTEAD AND THE TOWNSHIP

1. *The Black House*

342
343

THE 'black house' of Lewis proper contains within four walls—or rather its one continuous wall—both men and animals (Fig. 10(A)). It is the simplest surviving homestead in Western Europe. The basis of its plan, with its threefold division—for animals, for living, and for sleep—makes it not merely a house but a home and steading in one, a single homestead. The basis of its plan is still found on many a Scottish croft, and Burns' cottage was built as "byre, but and ben"—a cowshed, a room 'without' and a room 'within'. In isolated cases in the Lews, however, the partitions are still low; so that one could sit on a stool by the mid-floor fire and see mother and babe, and behind them cow and calf. The scene recalls a painting of the Holy Family, but whereas Joseph the Carpenter felt his wife hard-pressed when they took refuge beside ox and ass, this primitive homestead with its quietly borne hardships has been the rule in rural Lewis until well after 1919.

[353]

As men and animals share the same roof, warmth is

NEXT FICHE

342 later times the landlord might supply timber. Long
345 ago a main source of timber was the shore. The length
[313] of the house may be fifty to sixty feet, and the inside
[422] breadth ten to twelve feet, spanned by ten or a dozen
[178] pairs of couples on which are laid transverse 'cabers',
353 which may be tree trunks, branches, odd wood, old oars, or, exceptionally, sawn timber. The tops of the walls are finished with turf, to keep the filling from being washed out, and to provide a smooth bearing for the couples, the ends of which are pushed into the turf so as to bear on the inner half of the wall; the rounded form and absence of overhanging eaves prevent a gale obtaining purchase on the roof, but a gable with chimney is now usual on the
356 end wall of the inner room. The rafters are annually covered with turf, and the roof is thatched with thin, short barley straw, which was pulled up, not cut, after the ears were picked off, the roots gripping well, and the stem hanging outward and down.

353 The door gives direct access to the byre (*bathach*), through which one reaches the middle part, or living-room, 'at the fire' (*aig an teine*), from which there opens the inmost part, the 'room' with bed-closets. There is no ceiling to the primitive house, the row of box beds having tops to keep off the drips of rain water. In the middle of the earthen, sanded floor of the living-room is the circular hearth, built of stones with clay between, and raised a few inches, with no chimney.

343 In the byre, the manure accumulates from spring to spring, and a breach is made in the end of the house for the annual removal of the manure. There are no privies. Where there is fodder and straw in any quantity a barn
342 is added. Stacks are rare because of wind. A low wall,
343 continuous with the house and barn, may enclose the kale-
351
251

342 yard and occasionally a barley-kiln in which to dry grain
345 before malting it for home-brewed beer. A 'black mill',
351 with its primitive horizontal water-wheel, stands apart by
[251] some burnside.
[273]

Round the circular hearth, a large company can assemble in very social fashion for talk, story and song, the meeting
354 *together* (*ceilidh*). By the transfer of the hearth from the
571 centre and the substitution of a gable fireplace and regular
538 chimney, the social circle is halved, while meantime the
[178] tales of the *ceilidh* are forbidden or forgotten. Happily the bench still stands against the wall, near to the open
• [353] door, through which neighbours slip in with a word of greeting to find a customary welcome.

342 The dwellings on the summer pastures out on the
361 moors show great variety, illustrated in Fig. 10(B). A simple
[178] type in use is built of turf and stones, lightly roofed with turf placed on spars. A more primitive 'beehive' type (which fell out of use before 1900) was stone-built and
[171] corbelled, probably for lack of timber. And whereas the lighter type always stands by itself, the corbelled type was added to until a dozen cells formed a single mass, suggestive of ancient 'neolithic' hamlets as at Skara Brae in Orkney, described by Childe, and of the domed, corbelled huts of the ancient East.

[343] A further type was the 'spring house' of Tolsta, NE. Lewis, in which both cattle and folk sheltered in spring a little way from the village, before going out to the more
[124] distant moor. Mr. Donald Macdonald, F.R.S.G.S., a
[178] native of Tolsta, informs me that the spring house was in use until 1936. He remembers vividly how life in the shieling restored health and colour after the winter.

354

354 HEATING AND LIGHTING EQUIPMENT--systems for the lighting, heating, insulation, ventilating and air-conditioning of buildings; hearths and fireplaces; special lighting equipment (e.g., candles, oil lamps, gas lights, electric lights); special heating appliances (e.g., wood, coal, oil, gas, and electric stoves and furnaces); air-conditioning installations; insulating materials; etc. See also:

233 were taken out to small huts in the central moorlands
233 for several months during the summer. These moorland
342 dwellings, called sheilings or airidh, were tiny stone structures, as small as seven by five feet. They had double stone walls filled with clay, and a rounded thatched roof. There were two doors opposite each other in the longer walls, one of which was filled with turf depending on the direction of the wind. A fireplace
• [364] was built into one end of the hut; shelves in the stone
[352] walls held basins of milk and other items; and the major part of the sheiling constituted a grass-and-heather-lined cavity which served as a bed. The sheilings were usually
[361] clustered together near a stream, duplicating neighbourhoods within the village.

221 Ploughing and planting were finished in the spring before the young men and women went off to the fishing, and before the cattle were taken to the sheiling. Some families went to the sheiling as early as March for a "fresh bite" of grass. Many went out in the middle of May, and returned at the end of July or beginning of August.

233 "During the week, young girls or boys stayed out on
857 the sheilings, depending on who was available in the
887 family; maybe old people who couldn't do anything else,
462

121 being determined by conditions of culture, such as
121 political and economic conditions. Under conditions
178 of gradual centralization of economic and political
182 systems, the geographically marginal crofting areas have evolved strategies, some of which puzzle agencies concerned with development or other aspects of governmental process.

178 Before the North of Scotland Hydro-Electric Board
365 began to operate in the crofting counties, not more
511 than one croft in every hundred had electricity; but by the end of 1951, one in every six holdings had been supplied (Taylor 1954: 20). "The light" came to
• [354] Shawbost in 1951. Before then, the islanders used
[199] Tilley lamps, a Canadian invention; and before then,
[312] double-wick paraffin lamps. Piped water came a few
[464] years later, around 1955; it was brought from a nearby loch, and the construction work gave temporary jobs to local people. The availability of these services
[344] facilitated the building of county council houses,
[342] which many welcomed as providing a relief to the congestion caused in part by rules against building more than one house on a croft. But, paradoxically,
[651] with larger, better homes and all these services came a decrease in the advantages of living in a crofting township: property was assessed and people began paying rates or taxes.

522 In nation-wide comic strips and jokes, the Highlander
181 plays the role of the clown, the rustic country cousin. The comic strip "Angus Og" portrays a kilted Highlander, sly and canny behind his apparent simplicity, tricking the landlord and searching for the Loch Ness monster. Stories of the lazy, dour crofter abound.[1]

166 When young men go away to the Army or Navy or to
181 work on the mainland, they say that they feel like "foreigners." "Thirty years ago the island was very
176 isolated. It was difficult to get away. There were
166 so few education grants available. I got my teaching
182 certificate and wanted to get a post back on the island,
871 but was told there wouldn't be a vacancy for another fifteen years. So I went down to England, and found I had to be at least as good as an Englishman if not better in my job to get ahead."

178 "When I went into the RAF, I had never seen light
365 switches because we used paraffin lamps. An English
• 354 chap told me to turn the light on, and I didn't know which way meant on or off. That memory still sticks in m

[1] Even a high official in the Highlands and Islands Development Board tells a joke, that is "presently going round Westminster," of the Spaniard who approached the Highlander and told him of the word <u>manana</u> which he translated as "Don't do today what you can put off till tomorrow," asking if there was a corresponding word in Gaelic. "In Gaelic," replied the Highlander, "we have no word that conveys such a sense of urgency."

203 the Lord that his prayers had been answered.") Another
205 bothan was started in an old bus.
[175]

Today only one bothan exists in Shawbost. It is a
• [354] small concrete structure, lit by gas and heated with coal,
which is burned in an expensive fireplace. Like most
bothans, the one entrance faces away from the main road.
Unlike most bothans, it has a small window which is
curtained but nevertheless reveals whether or not the light
is on inside. Most bothans present blank, windowless and
doorless faces that give no indication whether or not the
building is occupied.

[208] Every three years a poll may be taken within a parish
to determine whether the parish should be wet or dry.
[166] After the parish of Uig voted itself "wet," the Doune Braes
Hotel was opened in Carloway, only five miles from Shawbost.
[329] One of the arguments for making the parish "wet" was that
drinking at the bothans would cease, and men would drink
under more controlled circumstances. "The married men
usually went home from the bothan at a reasonable hour,
but the single men just stayed there talking all night.
At the hotel, they have to go home at 10:00."

Despite the opening of the hotel so close to Shawbost,
the bothan remained open. The drink was cheaper and the
atmosphere less formal. Unlike the bothans in Ness, however,
[171] the Shawbost bothan was usually open only on Saturday, the

ing, 73 per cent have the language, which has been introduced 197
by immigrant country folk and their descendants.

HEALTH AND HOUSING

Despite the harsh conditions of centuries, the physical health of 175*
the island was good in early times. Epidemics were rare due to 164
isolation, though on occasion smallpox carried away many child-
ren. The commonest diseases were fevers, jaundice, dysentery and 175*
diarrhoea. Bloodletting (as in many another more advanced com- 197
munity) was the usual cure for fevers and dysentery. For coughs
the people took a 'brochan' or soup of roots of nettles and reeds
boiled in water with yeast; the meal of a black bean, mixed with 175*
boiled milk, was a useful cure for dysentery. Reports describe the 142
folk as being well-proportioned, free from bodily imperfections and
of good stature; healthful and strong-bodied.

But privations, particularly the frequent recurrences of near- 175*
famine, coupled with the primitive housing conditions, began to 164
take their toll. The increasing sickness rate aroused the concern
of authority. The most primitive dwellings had but one room, 175*
with the cattle at one end and the family at the other. In 1830 242
Seaforth sought at least to put an end to this, ordering that a 231
partition must be erected between beast and man, 'and that more
light should be admitted into the dark recesses of their habitation'.
This type of one-room dwelling was not confined to the island, 184
being found with many variants throughout the Highlands and
Islands area. The old Lewis house was, as a rule, an oblong struc-
ture, varying in length according to the means and requirements
of the occupier. It had but one door, and frequently had no win-
dows. Chimneys did not find favour, mainly because any open- 354
ing for the escape of smoke from the centrally-sited hearth tended 241
to reduce the quality of soot produced; and soot was regarded as a
valuable manurial product. If there was a hole in the roof to admit
some light, a small pane of glass was fixed into it: this soon had
a coating of soot, and the sole source of light was the doorway—
when the door was open. The family and the cattle used the same 231
entrance; and the cows' dung was removed once a year in the
springtime.

342
354 •
231

Hebridean type of 'black house': plan and cross-section

*175 In 1899, the Medical Officer of Health for the Parish of Bar-
342 vas described the typical Lewis crofter's house of the time. It had
three apartments, two for the family, and a third for the cattle;
this new arrangement was the result of the Regulations issued by
[333] Sir James Matheson for the betterment of the estate. The low
thick walls were built of stone, or stone and turf, with a packing
of loose earth, and were perennially damp. The roof, composed of
a framework of wooden rafters and couples resting on the inner
edge of these walls, was covered over with turf divots and straw,
bound with ropes of straw, heather or coarse thatching rope, and
weighted down with stones. It was never air- or water-tight, and
roof water usually soaked into the packing of the walls and thus
oozed into the house. Further, only the slightest attention was given
to situation and drainage. The floor of the dwelling apartment
was composed of a pavement of rough stones covered over with
clay—and a cold damp floor it was. The cattle apartment had
[231] no pavement, so that the manure liquids and slop water perco-
lated into the ground and at times found their way into neigh-
bouring dwelling houses and even into the drinking wells. Many
of the houses were built back-to-back and sometimes in rows
three deep. Lighting was deficient and the windows, fixed either
in walls or roof, were not made to open.

*175 Some houses had round portholes in the roof at the top of the
342 wall which might be opened or closed at pleasure; these served
• for lighting and ventilation at the byre end of the house, though
occasionally they were present also at the living end. Draughts
coming in through the roof and walls, and the blazing peat fire
in the centre of the middle apartment, helped to keep the air
in motion, but the smoke from the fire frequently filled the upper
portions of the room and, there still being no chimney or other
outlet as a rule, it pervaded the whole atmosphere of the house.
*175 From a sanitary point of view such houses had the gravest of
342 defects: it amazed visiting doctors that infectious diseases were
[164] ever absent. Yet generally the inmates compared well in physique,
general well-being and immunity from serious disease with those
more favourably situated. Tuberculosis was the most prevalent
enemy.
[429] In 1879, improving leases were offered to those who were will-
[144]

[TEXT CONTINUED ON PAGE 145]

HARRIS'S OFFSHORE ISLANDS

Scarp

361 Until 1972 Scarp was the most westerly inhabited island in
Scotland, separated from the Harris mainland by a strait which
is about half a mile across at its narrowest, coursed by strong
[135] tidal currents. The island is about three miles in diameter,
rugged, especially in the north and west, with cliffs on all sides;
361 the maximum altitude is nearly 1,000 ft. On the east side lies a
311 tiny marginal belt of good land, machar and soil; on this green
[134] shelf, about one-third of a mile long, were all the crofts of the
[241] Scarp settlement. Many stand deserted, and abandoned lazy-beds
in sites beyond the present settlement indicate a denser popula-
tion at one time. The island's population-carrying capacity was
severely limited by the minute amount of land available for
tillage: of a total of about seven square miles only half a square
mile can be used. Climatic conditions and soil type also restrict
the range and quality of crops grown.

*175 Scarp was originally settled about 1810 and was occupied by
361 eight farming families who were reasonably comfortable. Not
only did they have the island to themselves, but they had access
to good pasturage on the Harris mainland opposite. About 1823
[166] thirteen small townships between the head of Loch Resort, Harris,
and Bunabhainneader were cleared, some of the displaced families
coming to Scarp. Some emigration back to Harris took place in
the 1840s, but when about 1868 the proprietor divided Scarp into
sixteen crofts instead of the previous eight holdings, these were
further divided by the people themselves, trying to accommodate
[162] their families and friends from elsewhere. In 1861 the population
was 151; the peak was reached in 1881 with 213 persons. In 1951
it was 74. Communication with the Harris mainland is by boat,
plying between two stone-built jetties.

The local economy was essentially a subsistence one, with self-
433 sufficiency in such products as potatoes, turnips, cabbages, oats,
241 milk and fish. After a break of some years lobster-fishing has
234 recently been reinstated as an occupation. Oil lamps are the only
226 lighting, though a few houses have piped water. The small shop
• 351
332

and to show their friends at home, that they had braved the 184
hazardous Atlantic seas to visit St Kilda on the very edge of the 361
world. The tourists were charitable, but this brought a psycho- 175*
logical evil in its wake. In 1886, Robert Connel wrote: 'One [155]
cannot be long on the island without discovering the great moral
injury that tourists and sentimentalists and yachtsmen, with
pocketful of money, are working upon a kindly and simple
people.' It was estimated that the islanders collectively derived a [434]
profit of 5s from each of the 200 or more tourists who arrived
during the short summer.

The new influx of cash into a community which required 436
money as an exchange commodity because the original native 198
produce was becoming less saleable, hastened the decline of effort
to be self-supporting. The numbers of seabirds slaughtered [334]
steadily fell; paraffin oil replaced the traditional bird oil in St [329] •
Kildan lamps. The need for daily work, to toil in fellowship with [461]
others, was dissipated; the islanders could purchase most of the
food they required, provided communications with the mainland
were maintained. The population was in any case dwindling, as [161]
St Kildans became more aware of 'the other life' available on the
mainland of Britain.

Finally, on a misty summer's day in August 1930, at a cost to 166
the nation of little under £1,000, St Kilda was left to the care
and keeping of the changeless Atlantic. It is now preserved by the
National Trust for Scotland as a crumbling monument to a small
human tragedy of a kind that has been repeated, and will be re-
peated, in other small communities who cannot argue out the
case for their survival in terms of economic viability. The island [712]
is now occupied by military personnel in connection with the
Hebridean rocket range on South Uist.

St Kildans were described by Dean Monro, in 1549, as 'simple, 175*
poor folk, scarce learned in any religion'. In 1698, Martin Martin 181
published *A Late Voyage to St Kilda*. He went there in the com-
pany of a minister who had been summoned to the island to de-
nounce a certain false prophet who had risen among the 180
inhabitants (pretending he was an emissary of St John the Bap-
tist). Martin found, as did later visitors, that the island economy [825]
and the quality of its life were closely dependent upon its birds,

FIG. 10 (B) (*facing*).—The summer shieling, past and present, and the spring house. (From the writer's field sketches, and after Thomas Curwen, L. MacDougal and D. Macdonald, Tolsta.)

A. The modern turf shieling (*àirigh*). B. The ancient beehive shieling. C. The spring house (*tigh earraich*). D. Beehive shielings added to each other to form a single mass.

121 being determined by conditions of culture, such as
121 political and economic conditions. Under conditions
178 of gradual centralisation of economic and political
182 systems, the geographically marginal crofting areas have evolved strategies, some of which puzzle agencies concerned with development or other aspects of governmental process.

178 Before the North of Scotland Hydro-Electric Board
365 began to operate in the crofting counties, not more
511 than one croft in every hundred had electricity; but by the end of 1951, one in every six holdings had been supplied (Taylor 1954: 20). "The light" came to
• [354] Shawbost in 1951. Before then, the islanders used
[199] Tilley lamps, a Canadian invention; and before then,
[312] double-wick paraffin lamps. Piped water came a few
[464] years later, around 1955; it was brought from a nearby loch, and the construction work gave temporary jobs to
[344] local people. The availability of these services
[342] facilitated the building of county council houses, which many welcomed as providing a relief to the congestion caused in part by rules against building more than one house on a croft. But, paradoxically,
[651] with larger, better homes and all these services came a decrease in the advantages of living in a crofting township: property was assessed and people began paying rates or taxes.

522 In nation-wide comic strips and jokes, the Highlander
181 plays the role of the clown, the rustic country cousin. The comic strip "Angus Og" portrays a kilted Highlander, sly and canny behind his apparent simplicity, tricking the landlord and searching for the Loch Ness monster. Stories of the lazy, dour crofter abound.[1]

166 When young men go away to the Army or Navy or to
181 work on the mainland, they say that they feel like "foreigners." "Thirty years ago the island was very
175 isolated. It was difficult to get away. There were
166 so few education grants available. I got my teaching
182 certificate and wanted to get a post back on the island,
871 but was told there wouldn't be a vacancy for another fifteen years. So I went down to England, and found I had to be at least as good as an Englishman if not better in my job to get ahead."

177 "When I went into the RAF, I had never seen light
365 switches because we used paraffin lamps. An English
• 354 chap told me to turn the light on, and I didn't know which way meant on or off. That memory still sticks in me."

[1] Even a high official in the Highlands and Islands Development Board tells a joke, that is "presently going round Westminster," of the Spaniard who approached the Highlander and told him of the word mañana which he translated as "Don't do today what you can put off till tomorrow," asking if there was a corresponding word in Gaelic. "In Gaelic," replied the Highlander, "we have no word that conveys such a sense of urgency."

273 the Lord that his prayers had been answered.") Another
275 bothan was started in an old bus.
[175]

Today only one bothan exists in Shawbost. It is a
• [354] small concrete structure, lit by gas and heated with coal, which is burned in an expensive fireplace. Like most bothans, the one entrance faces away from the main road. Unlike most bothans, it has a small window which is curtained but nevertheless reveals whether or not the light is on inside. Most bothans present blank, windowless and doorless faces that give no indication whether or not the building is occupied.

[208] Every three years a poll may be taken within a parish to determine whether the parish should be wet or dry.
[66] After the parish of Uig voted itself "wet," the Doune Braes Hotel was opened in Carloway, only five miles from Shawbost.
[829] One of the arguments for making the parish "wet" was that drinking at the bothans would cease, and men would drink under more controlled circumstances. "The married men usually went home from the bothan at a reasonable hour, but the single men just stayed there talking all night. At the hotel, they have to go home at 10:00."

Despite the opening of the hotel so close to Shawbost, the bothan remained open. The drink was cheaper and the atmosphere less formal. Unlike the bothans in Ness, however,
[191] the Shawbost bothan was usually open only on Saturday, the

ing, 73 per cent have the language, which has been introduced 197
by immigrant country folk and their descendants.

HEALTH AND HOUSING

Despite the harsh conditions of centuries, the physical health of 175*
the island was good in early times. Epidemics were rare due to 164
isolation, though on occasion smallpox carried away many children. The commonest diseases were fevers, jaundice, dysentery and
diarrhoea. Bloodletting (as in many another more advanced com- 175*
munity) was the usual cure for fevers and dysentery. For coughs 157
the people took a 'brochan' or soup of roots of nettles and reeds
boiled in water with yeast; the meal of a black bean, mixed with
boiled milk, was a useful cure for dysentery. Reports describe the 175*
folk as being well-proportioned, free from bodily imperfections and 142
of good stature; healthful and strong-bodied.

But privations, particularly the frequent recurrences of near- 175*
famine, coupled with the primitive housing conditions, began to 164
take their toll. The increasing sickness rate aroused the concern
of authority. The most primitive dwellings had but one room, 175*
with the cattle at one end and the family at the other. In 1830 342
Seaforth sought at least to put an end to this, ordering that a [231]
partition must be erected between beast and man, 'and that more
light should be admitted into the dark recesses of their habitation'.
This type of one-room dwelling was not confined to the island, [184]
being found with many variants throughout the Highlands and
Islands area. The old Lewis house was, as a rule, an oblong structure, varying in length according to the means and requirements
of the occupier. It had but one door, and frequently had no windows. Chimneys did not find favour, mainly because any open- [354] •
ing for the escape of smoke from the centrally-sited hearth tended [241]
to reduce the quality of soot produced; and soot was regarded as a
valuable manurial product. If there was a hole in the roof to admit
some light, a small pane of glass was fixed into it: this soon had
a coating of soot, and the sole source of light was the doorway—
when the door was open. The family and the cattle used the same [231]
entrance; and the cows' dung was removed once a year in the
springtime.

342
354
231

Hebridean type of 'black house': plan and cross-section

133 (2) cliff-cut, where exposed stretches have been undermined by the Atlantic storms; and (3) sandy, where bays like Broad Bay have been filled in, or where shingle bars have enclosed a sheet of fresh water, as on the west coast (north-west of Stornoway) from Barvas southward to Dalebeg. The types of coast are illustrated by Plates II to V.

As to the sea floor—so important to fish-life and to navigation—the west coast of the Outer Hebrides borders a well-featured continental platform, which is higher in the north and south but lower in the middle. The irregularities suggest a former land-surface dissected by rivers with mature drainage systems.[1] The contours are revealing, as shown in the coloured map at the end, at intervals of 10 fathoms (60 feet). The sandy machar beaches of western South Harris, visible at low tide, form part of a wide, shallow shelf extending for a dozen miles off west South Harris to a depth of no more than 20 fathoms, and thence southwards along the machars of Uist to Barra; but the coast falls away steeply round most of Lewis and along the rocky east coast of 'the Long Island'.

5. *Glacial Drift or Boulder Clays, and Shell Sand*

Underlying the peat is the drift, which is spread over
133 all but the rockiest parts of the island. This is not only
314 exposed at every roadside cutting but is laid bare in wide areas around the villages. Here peat-cutting during the centuries has removed the peat, layer after layer, to the
• [356] topmost turf, left aside after cutting until the last. When
[134] even this turf is removed for annual thatching, the bare
[113]

[1] S. Ting, B.Sc. (China). *Geografiska Annaler*, Band 19, 1937, pp. 62-83.

133 clay is exposed, leaving what is vividly called 'skinned'
314 land. And where drift is exposed, the mineral constituents
134 are leached out, and a hard 'moor pan' is left a few inches
• [356] below the surface.

Seen from the edge of the crofts, the typical 'skinned
134 lands' of bare, blue or brownish clay, littered with stones,
139 suggest a desert. Often, only a few blades of grass or tufts of heather grow on them. Indeed, 'skinned land' seems at first too mild a term, for on it the stones—thickest on top when undisturbed, and bleached by the acids of the peat that overlay them—suggest the prophet's 'field of bones'. One can only ask, is the rest of his vision ever to be fulfilled and life to spring again? In some hilly parts to south and west, not only the 'skin', the topmost layer of peat, but the very soil, the flesh as it were, is still being
[166] stripped bare to the bone, the actual rock. The evacuation of the islet of Bgrnera Beag (Uig) was largely due to this stripping. In the more level parts to the north, however, roadside pits show sections of clay with few stones, covered with perhaps six inches of clay with many stones. It is this top layer which gives the skinned land such a hopelessly stony appearance, and shows that reclamation is less miraculous than it seems.

134 With the coming of carts and lorries the increasing use
242 of shell sand has become possible, whether for spreading on the land or for slipping into pockets, together with
[178] fertilisers, for potato seed. As to soils, shell sand and
[493] boulder clay possess complementary qualities in texture and chemical composition. The shell sand of the machars provided an early home for man, the light soil allowing rye, a poor variety of oats, and herbage, to ripen early and mature in late, wet seasons when the clays are sodden with rain. Yet the sand itself is so light that drought is

342 later times the landlord might supply timber. Long
343 ago a main source of timber was the shore. The length
[313] of the house may be fifty to sixty feet, and the inside
[422] breadth ten to twelve feet, spanned by ten or a dozen
[178] pairs of couples on which are laid transverse 'cabers', which may be tree trunks, branches, odd wood, old oars, or, exceptionally, sawn timber. The tops of the walls are
353 finished with turf, to keep the filling from being washed out, and to provide a smooth bearing for the couples, the ends of which are pushed into the turf so as to bear on the inner half of the wall; the rounded form and absence of overhanging eaves prevent a gale obtaining purchase on the roof, but a gable with chimney is now usual on the
• 356 end wall of the inner room. The rafters are annually covered with turf, and the roof is thatched with thin, short barley straw, which was pulled up, not cut, after the ears were picked off, the roots gripping well, and the stem hanging outward and down.

353 The door gives direct access to the byre (*bathach*), through which one reaches the middle part, or living-room, 'at the fire' (*aig an teine*), from which there opens the inmost part, the 'room' with bed-closets. There is no ceiling to the primitive house, the row of box beds having tops to keep off the drips of rain water. In the middle of the earthen, sanded floor of the living-room is the circular hearth, built of stones with clay between, and raised a few inches, with no chimney.

343 In the byre, the manure accumulates from spring to spring, and a breach is made in the end of the house for the annual removal of the manure. There are no privies. Where there is fodder and straw in any quantity a barn
342 is added. Stacks are rare because of wind. A low wall,
343 continuous with the house and barn, may enclose the kale-
351

(B) SACRAMENTS OF THE HEARTH AND THE PLAIDING

788 For shelter and life by the hearth there are noble runes.
592 The house with its household was blessed, when newly
• [356] built by a bridegroom's friends, yearly after its thatching, or regularly at nightfall. The blessing was said by the goodman in the presence of his family and helper-neighbours, or intimately by either of the parents as they went to rest (*Carmina*, Nos. 44, 45).

In the darkness of the 'black house' the fire was a
[354] centre of warmth **and light,** of life and union. "The Blessing of the Living" (the Fire) was said by the housewife as she rekindled or, rather, uncovered the sleeping
788 embers when she rose. Those who, tired or in want,
592 have ever lit a fire in darkness may best feel, in her words,
354 how the glow without kindles the light within.
539 "I will kindle my fire today in presence of the angels . . .
Without malice . . . or fear . . . of any one under the sun,
But the Holy Son of God to shield me."

And then (as the dim glow lightens and warms): "God, kindle Thou in my heart within, A flame of love to my neighbour, To my foe, to my friend, to my kindred all, To the brave, to the knave, to the thrall. . . . From the lowliest thing that liveth To the name that is highest of all (*Gu ruig an t-Ainm is airde*)." In spirit this reaches universality; its verse-form is purest poetry (*Carmina*, No. 82).

For the covering, smothering or smoo'ring of the embers at night, the following was said to me not long ago

(c) House-building. APPENDIX I
— From 1920 to 1940 the Department of
649 Agriculture advanced loans for the erection of 760 new houses
654 and the repair of 220 other houses. This, with the erection
746 or repair of 40 steadings, may be taken as the equivalent of
1000 houses in the 20 years of peace, of which three-fourths
367 were new. Rural building was at its height in the early 'thirties,
• 356 but 1938 was a typical year. Taking the value of each house as £600 and subtracting half for imported materials, we may assume that for 50 houses built that year the labour given
431 produced an output of £15,000. In addition, some house-
362 building and repair was done without State aid, for which a
guess of £15,000 may be made. Such sums may not appear
356 large, but they correspond to the enduring fulfilment of a prime
[439] need, a 'real wage', of importance when compared to rents and costs elsewhere. Of the expenditure on house-building in Stornoway burgh during 1938, the value may be assessed as £10,000, of which £9000 was for Local Authority housing. Most of the total was produced by local labour.

(iii) *Fishing Industry—Net Output and Earnings*

434 (a) For 1938 the total catches, prices and quantities of
fresh cured fish landed in Stornoway District show a value of
228 nearly £100,000 (£98,000) for the herring catch, and of £162,400
for the cured herring. Our problem is to estimate what fraction of these sums may be included in the net output of the Island
[127] industry proper. The Fishery Board's *Statistical Tables* and *Annual Report* extract the produce brought in by local boats from the total, separating it from that due to 'strangers', and so permitting a fairly reliable estimate, checked by local enquiry.

228 Of the herring taken, nearly 80 per cent were caught in the
summer fishing, June to August (*Annual Report*, p. 13). The
501 week of maximum local activity in herring fishing for Stornoway District may be taken to be characteristic of this pre-war period (Table 8). There were then 111 steam-boats engaged; and as only five were locally registered (at Stornoway itself), the remaining 106 were strangers. There were also 66 motor-boats engaged and though 81 motor herring-boats are locally

*175 In 1899, the Medical Officer of Health for the Parish of Bar-
342 vas described the typical Lewis crofter's house of the time. It had three apartments, two for the family, and a third for the cattle; this new arrangement was the result of the Regulations issued by Sir James Matheson for the betterment of the estate. The low
[333] thick walls were built of stone, or stone and turf, with a packing of loose earth, and were perennially damp. The roof, composed of a framework of wooden rafters and couples resting on the inner edge of these walls, was covered over with turf divots and straw, bound with ropes of straw, heather or coarse thatching rope, and weighted down with stones. It was never air- or water-tight, and roof water usually soaked into the packing of the walls and thus oozed into the house. Further, only the slightest attention was given to situation and drainage. The floor of the dwelling apartment was composed of a pavement of rough stones covered over with clay—and a cold damp floor it was. The cattle apartment had
[231] no pavement, so that the manure liquids and slop water percolated into the ground and at times found their way into neighbouring dwelling houses and even into the drinking wells. Many of the houses were built back-to-back and sometimes in rows three deep. Lighting was deficient and the windows, fixed either in walls or roof, were not made to open.

*175 Some houses had round portholes in the roof at the top of the
342 wall which might be opened or closed at pleasure; these served for lighting and ventilation at the byre end of the house, though
• 354 occasionally they were present also at the living end. Draughts coming in through the roof and walls, and the blazing peat fire in the centre of the middle apartment, helped to keep the air in motion, but the smoke from the fire frequently filled the upper portions of the room and, there still being no chimney or other outlet as a rule, it pervaded the whole atmosphere of the house.
*175 From a sanitary point of view such houses had the gravest of
342 defects: it amazed visiting doctors that infectious diseases were
[164] ever absent. Yet generally the inmates compared well in physique, general well-being and immunity from serious disease with those more favourably situated. Tuberculosis was the most prevalent enemy.

In 1879, improving leases were offered to those who were will-
[429] [440] [TEXT CONTINUED ON PAGE 145]

A HARRIS VIGNETTE

HARRIS'S OFFSHORE ISLANDS

Scarp

361 Until 1972 Scarp was the most westerly inhabited island in Scotland, separated from the Harris mainland by a strait which is about half a mile across at its narrowest, coursed by strong
[133] tidal currents. The island is about three miles in diameter, rugged, especially in the north and west, with cliffs on all sides;
361 the maximum altitude is nearly 1,000 ft. On the east side lies a
311 tiny marginal belt of good land, machar and soil; on this green
[134] shelf, about one-third of a mile long, were all the crofts of the
[241] Scarp settlement. Many stand deserted, and abandoned lazy-beds in sites beyond the present settlement indicate a denser population at one time. The island's population-carrying capacity was severely limited by the minute amount of land available for tillage: of a total of about seven square miles only half a square mile can be used. Climatic conditions and soil type also restrict the range and quality of crops grown.

*175 Scarp was originally settled about 1810 and was occupied by
36 eight farming families who were reasonably comfortable. Not only did they have the island to themselves, but they had access
[166] to good pasturage on the Harris mainland opposite. About 1823 thirteen small townships between the head of Loch Resort, Harris, and Bunabhainneader were cleared, some of the displaced families coming to Scarp. Some emigration back to Harris took place in the 1840s, but when about 1868 the proprietor divided Scarp into sixteen crofts instead of the previous eight holdings, these were further divided by the people themselves, trying to accommodate
[162] their families and friends from elsewhere. In 1861 the population was 151; the peak was reached in 1881 with 213 persons. In 1951 it was 74. Communication with the Harris mainland is by boat, plying between two stone-built jetties.

433 The local economy was essentially a subsistence one, with self-
241 sufficiency in such products as potatoes, turnips, cabbages, oats,
234 milk and fish. After a break of some years lobster-fishing has
226 recently been reinstated as an occupation. Oil lamps are the only
• 354 lighting, though a few houses have piped water. The small shop
336
000

ST KILDA

and to show their friends at home, that they had braved the 484
hazardous Atlantic seas to visit St Kilda on the very edge of the 36
world. The tourists were charitable, but this brought a psycho- 175*
logical evil in its wake. In 1886, Robert Connel wrote: 'One [155]
cannot be long on the island without discovering the great moral injury that tourists and sentimentalists and yachtsmen, with pocketsful of money, are working upon a kindly and simple people.' It was estimated that the islanders collectively derived a [434]
profit of 5s from each of the 200 or more tourists who arrived during the short summer.

The new influx of cash into a community which required 436
money as an exchange commodity because the original native 198
produce was becoming less saleable, hastened the decline of effort to be self-supporting. The numbers of seabirds slaughtered [232]
steadily fell; paraffin oil replaced the traditional bird oil in St • [364]
Kildan lamps. The need for daily work, to toil in fellowship with [461]
others, was dissipated; the islanders could purchase most of the food they required, provided communications with the mainland were maintained. The population was in any case dwindling, as [161]
St Kildans became more aware of 'the other life' available on the mainland of Britain.

Finally, on a misty summer's day in August 1930, at a cost to 166
the nation of little under £1,000, St Kilda was left to the care and keeping of the changeless Atlantic. It is now preserved by the National Trust for Scotland as a crumbling monument to a small human tragedy of a kind that has been repeated, and will be repeated, in other small communities who cannot argue out the case for their survival in terms of economic viability. The island [712]
is now occupied by military personnel in connection with the Hebridean rocket range on South Uist.

St Kildans were described by Dean Monro, in 1549, as 'simple, 175*
poor folk, scarcee learned in any religion'. In 1698, Martin Martin 181
published *A Late Voyage to St Kilda*. He went there in the company of a minister who had been summoned to the island to denounce a certain false prophet who had risen among the 180 inhabitants (pretending he was an emissary of St John the Baptist). Martin found, as did later visitors, that the island economy [325]
and the quality of its life were closely dependent upon its birds.

365 company gave way to the North of Scotland Hydro-Electric Board.
*175 In that year there were 1,063 consumers, all within the Storno-
way burgh boundaries. With its social remit, the board started on bringing power to rural areas, even where uneconomic. Lighting
• [354] in the crofting townships was mostly by oil lamps, mainly the hot-mantle type (the 'Tilley'), but by 1960 the number of electricity consumers had reached 8,124, and the present number is about 96 per cent of the potential. Harris received its supply in
399 1954. The generating station is at Stornoway and employs diesel-
*175 engined units as prime movers, with an annual output of some 22,000,000 units. In August 1960 the Gisla scheme came into operation, the island's first hydro-electric plant; designed to produce some 2,000,000 units annually, it harnesses the waters of the Gisla River, which flows out of Loch Grunnabhat in the parish of Uig, Lewis. The station has a capacity of 540 kW. The other hydro-electric scheme is at Loch Chliostair in North Harris, planned to produce about 2,400,000 units annually.

The provision of water and drainage is still on the drawing
312 boards for a number of crofting townships, though work is progressing for others. The Uig water scheme has cost some £100,000, a relatively large sum for a small population and amplified by similar work for drainage schemes. This scale of public expenditure must continue if people are to stay in their native villages and not migrate to Stornoway or leave the island altogether. Stornoway's new water scheme has cost something in the region of £160,000, but is vital if the town hopes to attract industry. The original burgh water supply was started in 1846 by Sir James Matheson and a few businessmen. The capital of the Stornoway Water Company was only £800, but it gave the town a gravity-feed supply from the nearby Loch Aridh na Lic long before many larger places on the mainland had considered such projects. Heavy floodstorms destroyed the old dam in 1933, and a new waterworks at Loch Mor a Starr was opened in 1937. As Stornoway extended the old loch had outlived its usefulness; for many years there had been difficulty in getting water to the higher parts of the town, particularly during the heavy fishing seasons when the fishermen drew off large quantities.

000 in the far north. "There were two fishing seasons.
175 For one season you went to Fraserburgh, Stronsay,
223 Lerwick and Peterhead; and then the winter fishing was
[222] in England, at Yarmouth, Scarborough and Loucester.

"I remember in Yarmouth we didn't like the English
[262] bread, it was such a dull color. We liked the pure white Scotch bread."

They lived in small huts, and the work was hard but full of fun. Neighborhood girls used to go together, bringing bedding and different items in large chests to share in the housekeeping. Three girls worked together in a crew, and there were as many as six sharing a room, in double bunks. Some of the huts were so small that there was barely enough room for the beds and the cupboards. At night the boys would come in off the boats. "You were so tired from being up since early morning;
[599] but you were always able to dance. You were treated with
[178] respect; the youngsters today aren't so good." The women who married non-islanders that they met at the fishing were not likely to return.

175 When the weaving started on a large scale, the girls
288 "were glad enough to have work at home, even though the
464 work was hard." But many continued their temporary
175 absences from the island, working in hotels or as
464

464 Glasgow and other cities on the mainland (see Appendix
166 A).
• [357]

175 When the weaving started, some men settled at home
464 permanently, but many continued to come and go between
166 the sea and the loom. In 1931, the ratio of men to
462 women in Lewis and Harris was 100:114. The men came
[288] home for temporary jobs, such as the construction of roads
[522] or houses. Jokes are told of the common practice of sending for an extension of leave. The men found it easy
[906] to join the Naval Reserve because of their fishing experience; and it brought them a retainer's fee and expense-paid trips to places off the island for several weeks of training during the year. But when the wars came,
[901] the loss of men to the Navy and to the Merchant Service was heavy.

B. The Land

175 The number of arrears in rent in the Barvas rent
429 ledger at the turn of the century indicates the small amount of money in circulation at the time. Between 1899 and 1914, several crofters paid part of their rent "by work," and six had some of their stock "uplifted by decree." For example, a Widow Catherine lost "one red

[Lemreway]

229 The West Highland Survey Township Card[1] describes Lemreway as "predominantly a fishing
196 township". The remains of an old curing station are visible today and until 1947 there were twelve
[459] boats operating from Lemreway. A declining market, increasing cost of gear for obsolescent boats
[459] and the lack of a landing stage led to the decline of the industry in this township. Today there is
[459] one fishing boat which lands its catch in Stornoway: working with modern equipment, drift and ring
[529] nets, it provides a regular income for a crew of six.

[464] An examination of the population statistics proves interesting, especially when compared with
[459] those for Orinsay. Lemreway's resident population of just over 70 males and 70 females is large considering that there are six unoccupied crofts. Eleven of the crofts have more than one house and the cottar population forms over a third of the total residents. More than two-thirds of this resident population is in the two important age groups - between 15 and 64. With over forty resident males in the working age group, Lemreway provides a striking contrast to other crofting townships in Park.

[448] Fourteen of these men are full-time craft workers, while nine others find work in ancillary
[241] occupations such as weaving and fishing. A further eight supplement their craft work with regular
[241] employment - a postmaster and a postman, a bus driver, a lorry driver and several weavers. Just
[241] over thirty people work away from the township permanently, fourteen in the Merchant Navy and
[241] nine girls in domestic service, while a further nine engage in seasonal work.

[241] Emigration from the township has continued steadily with forty people leaving since 1939.
[241] Nevertheless, Lemreway has a larger proportionate resident population than most townships.

[597] Only four thatched houses are occupied and housing conditions generally are good. Every house
[592] has electricity, but, with four exceptions, water has to be carried from springs and wells. Most
[592] of the present houses were constructed in the 1930s and they are usually near to the road. Ruins
[592] of the old houses remain, some being used as byres, and these were built either along the shore or
[592] up the slope in the shelter of the hills, where the house was near the sheep, the peat and the springs.
[592] Today supplies of food, peat and even seaweed are brought by road.

[347] Mention must be made of the possibilities of the tourist trade in Lemreway with its most
[959] attractive situation and reasonable road connections. An approach has been made to the Scottish Youth Hostels Association and while hostellers could not greatly increase the income of the residents, they would stimulate interest in the area. Accommodation for summer visitors, other than relatives
[959] of the crofters, is difficult to find but it seems that at least three houses could be used.

000 It is possible to be optimistic about the future of Lemreway, as at the moment considerable
[447] enterprise is being shown. A Ferguson tractor, bought this year by a man returning from whaling,
[447] is an example. It is to be hired out and could be put to good use in some parts, especially on the
[311] mainland. The attempt to improve the common pasture and the new extensions to neatly painted houses
[383] all reflect a combined effort to improve conditions. The old economy of crofter-fisherman is being adapted to modern times and crofter-weaver, crofter-postman and crofter-bus driver are the
[465] contemporary employment combinations.

[181] The pessimism and apathy noticed in many crofters is to be found in Lemreway but above this
[000] is the impression of enterprise. If Lemreway can continue to adapt itself to changing conditions, it may be able to combat the 'drift to Glasgow' and continue as a successful community.

ORINSAY

Beth Blowers, Brenda Turner and John Wearmouth

[183] Orinsay is a small crofting township clustered, in the form of a horseshoe, around the head of
[467] a sheltered bay on the northern side of Loch Shell. Most of the houses are situated within fifty yards
[281] of the shore on a narrow strip of level land, while the crofts extend from the shore on to the moor

1. The Directors of the Crofting Survey are grateful to Dr. F. Fraser Darling for granting access to the individual Township Cards, which are a storehouse of information. For detailed contents of the cards, see West Highland Survey p. 247.

342 maintained—once an important aid to the survival of half-
343 starved cattle. A slope from the dwelling-quarters down to the byre facilitates drainage: normally the length of the
[178] homestead follows the slope. The separation of house from byre took place in Harris and Uist over seventy years ago by County Council decision, but in most of Lewis, even in 1947, about 40 per cent of the homesteads were
342 of the primitive type, outwardly but little changed. This separate cottage, as in Harris, is a shapely little structure, roughly symmetrical and particularly pleasing when the walls are whitewashed below the pale-gold thatch.

342 The surviving 'black house' is a stone structure. As
343 Stevens has written, "the rock of the island is hard to
[314] work, and hard to win", and may be covered by peat. Undressed stones are collected and sometimes carried for
[324] long distances. Before dynamite came into use, a very large stone could be broken up by lighting a peat fire on it, then dashing cold water over it. By an old Gaelic custom, the bachelors of a township used to help to build the house for one of their friends who was about to marry.
[333] Lime for mortar being absent from the island, the walls are built dry. The wall is double, the space between being filled with earth. Hence it may be six feet thick
• [354] at the base, though barely six feet high. Typical primitive houses lacked windows, only a little light entering through the smoke vent and through a piece of oiled skin, replaced latterly by a pane of glass let into the thatch of the roof or by a deep window aperture in the wall.

342 Roof building is a difficult problem in construction,
343 on account of the scarcity of timber and the strength of
313 the winds, and explains the narrow plan. Wood was so scarce that when a house was abandoned the frame of the
[182] roof was removed, the spars being the tenant's; but in

LIC SERVICES

l and public services has been cited by
ctor encouraging people to leave the

island; but islands in isolation must carry a population of suitable numbers and age structure before they can support even a minimum of amenities. In the Western Isles, Stornoway used to be the only community to have a semblance of the services taken for granted in similar towns on the British mainland. The elements of commerce, industry, education and religion were established there initially, to spread with characteristic slowness first to the immediately accessible areas and then to remoter regions. Though many parts of the island are now at least within practicable travelling distance of the social and public services expected in urban communities, some townships have yet to see one or another of them within their own boundaries.

The Stornoway Gas Light Company was formed in 1840 by Sir James Matheson, with a capital of £350. The plant consisted of one horizontal retort which produced about 1,000,000 cu ft of gas annually. The old buildings still stand, and the plant now has three vertical retorts with an annual production of just over 40,000,000 cu ft. Rural areas use Calor gas, introduced to the island in 1935.

The public electricity supply has of course made the greatest impact on the island as a whole. Electricity was known in the island long before the public supply arrived, generated privately by individuals, hotel concerns or public authorities. One of the first plants of significance was installed in the second municipal building in Stornoway (the first, built in 1905, was destroyed by fire in 1918), and was driven by a gas engine. In 1919 Lord Leverhulme installed an electricity plant in Lews Castle, which also had a private intercommunication system. While this work was being done Leverhulme proposed to give electric lighting to the town. Other buildings with their own plant included the hospitals and the mills, which were turning to electric motors for driving their line shafting, the power take-off for spinning and carding machinery.

In 1929 an electricity supply company, with a capital of £12,000 was proposed, the Stornoway Electric Supply Company being registered in 1932. Its financial fortunes were chequered, though revenue was rising slightly by the time the second world war began. In 1948, on nationalisation of electricity supplies, the

(B) SACRAMENTS OF THE HEARTH AND THE PLAIDING

For shelter and life by the hearth there are noble runes. The house with its household was blessed, when newly built by a bridegroom's friends, yearly after its thatching, or regularly at nightfall. The blessing was said by the goodman in the presence of his family and helper-neighbours, or intimately by either of the parents as they went to rest (*Carmina*, Nos. 44, 45).

In the darkness of the 'black house' the fire was a centre of warmth and light, of life and union. "The Blessing of the Living" (the Fire) was said by the housewife as she rekindled or, rather, uncovered the sleeping embers when she rose. Those who, tired or in want, have ever lit a fire in darkness may best feel, in her words, how the glow without kindles the light within.

"I will kindle my fire today in presence of the angels . . .
Without malice . . . or fear . . . of any one under the sun,
But the Holy Son of God to shield me."

And then (as the dim glow lightens and warms): "God, kindle Thou in my heart within, A flame of love to my neighbour, To my foe, to my friend, to my kindred all, To the brave, to the knave, to the thrall. . . . From the lowliest thing that liveth To the name that is highest of all (*Gu ruig an t-Ainm is airde*)." In spirit this reaches universality; its verse-form is purest poetry (*Carmina*, No. 82).

For the covering, smothering or smoo'ring of the embers at night, the following was said to me not long ago

(in Gaelic) by a housewife in a Catholic isle, as our friendship matured. It had been said nightly at her fire by her father-in-law until his death (not long before), which had come after that of his wife. "I smoo'r the fire tonight, As Mary's Son smoo'red. Be it well with house and fire; Be it well with all our household. Who are on this floor? Peter and Paul. Who are on watch tonight? Light-white Mary and her Son. Thus God's voice taught, And the Angel spoke: The Angel at my house door, Until the clear day come tomorrow. Amen." As this variant shows, memory still lives in the Isles.[1]

In these runes, the key to the words "as Mary's Son and as Mary did, in their day" is the example of filial duty, of wifely and motherly care. In spite of lapses to 'Mariolatry' during periods of decadence in the Roman Church, the virtual banishment of Christ's mother from Protestantism has led to a loss deeper than Presbyterian Scotland has yet realised. Her name was a daily reminder, both of a woman's part in the spiritual life of the home, and of a son's self-discipline and affection: in a word, of mutual love.

For wool, the sheep were blessed, as in the "Clipping Blessing". There were blessings of the loom and of warping and weaving; and after neighbourly fulling or 'waulking' of the finished web, came its consecration. As the work was solitary and communal in turn, so the prayer. Carmichael's own fine prose translations should be studied (*Carmina*, vol. i, Nos. 108-113; cf. vol. iv, pp. 88-99). Yet, those being available, we quote rhythmic

[1] Cf. Rev. Allan Macdonald, *Comh-chruinneachadh*, p. 107; *Carmina* (Nos. 84-87, 324-326); and M. Kennedy-Fraser, *Songs of the Hebrides*, vol. ii, p. 31. Sacred lore is not to be picked up lightly by a stranger. It was only upon the second of my prolonged stays under her hospitable roof that this good woman would admit and impart her knowledge, treasured in the secret places of her heart.

The 1,700 acres of common pasture stretch to the east and west of the crofts, across the peninsula which terminates in Gallan Head, extending to those of Crowlista and Valtos in the south. The whole coast is broken and rocky, the land inland is peaty, and Aird lacks the advantages of the machair land found further west. To the north of the village there is now an R.A.F. radar station on Rudha Caol, built on what was part of the common pasture. It dominates the landscape and makes a considerable difference to the life of the inhabitants.

The township, though isolated, is reached by a good road which leaves the main road at the western end of Glen Valtos. Grocery vans call on Wednesday and Friday, a butcher's van on Saturday, and the local people are also allowed to shop at the N.A.A.F.I. within the Camp. The road through the village approximately follows the line of the 100 ft. contour and all the houses are built directly on to the road, with byres, weaving sheds and other buildings behind, whilst in most cases hens are kept on the steeper slopes below the road. Thus the settlement has far more of the appearance of an English village than have most crofting townships, but there is no shop or post office. The majority of the houses are stone with slate roofs and fairly large, though some of them have been built for more than fifty years. All have electric light and their own water supply and several have modern byres.

There are ten crofts, as the enlargement of one of the original nine was subsequently split off to make a separate croft. Of these, one tenant is an absentee and another an elderly woman who does no cultivation. In both these cases, grazing is let to others so that there are actually eight operative units. The crofts are fenced in their upper portions, but in most cases the fencing does not extend down to the river and there is free access to the single concrete footbridge which spans the stream.

The only crops now grown are oats and potatoes and a few vegetables, with some sown grass; natural grass provides most of the hay crop. Lime and shell sand and artificial fertilisers are used; the two former particularly on the ground near the river where the cultivation is in narrow strips separated by drainage ditches and ploughing is done by horse. Most of the cultivated land is on the gentler slopes behind the houses, where the use of a tractor is possible. Before 1914 most of the land within the original turf dyke was cultivated; here was grown and ground at the mill for meal for barley bread. Seaweed was extensively used as a fertiliser and most of the families kept eight or nine cows, so that there was a more plentiful supply of manure. Now, six of the families each keep one cow for domestic milk supply (two of the others each keep a goat). The township possesses no bull, but make use of those at Valtos or Ardroil.

On the other hand, the sheep soum is generally exceeded; instead of the entitlement of about 200, the total flocks grazed on the township pastures are approximately 500. The lambs are weaned early in August and put on Rudha Caol (Air Force use has not prevented this) and wedders are usually sold at the age of two or three years in Stornoway - many in October to reduce the numbers that must be pastured during the winter.

The total resident population of Aird consists of fifteen males and sixteen females. Of these, twelve are over 65, six are aged 45 - 64, 11 are in the 15 - 44 age-group (there are only three married couples) and there are two children under 15. Nevertheless, most of them are complete families; only one person lives alone; no members are reported as periodically working away, no men and only two women are permanently away. Neither has there been much emigration since 1939 - five women only have married out of the parish. The tenants of seven of the crofts are over the age of 65, the only one in the 15 - 44 age-group is a new-comer to the district and does little croft work.

beginning of the resettlement movement which has given the modern crofters of the district almost all the lands formerly occupied by small tenants. This process was completed in the Bernera region soon after 1918, and the problem now - one which is obviously going to become increasingly important - is not to give the crofters more land, but to find active crofters for the existing holdings (see Chapter III for more detailed information on clearance and resettlement).

The ground plans of the existing settlements vary considerably, depending mainly on the terrain. Where a township is spread along a fairly straight coast the natural tendency is for the croft boundaries to run at right angles to the coast and for each house to be set on its own croft. The best examples of this are Hacklete and Kirkibost, where an early nineteenth century (i.e. pre-clearance) lotting was readopted when the township was re-settled in 1878. Linshader, Lundale, Cruilvig and Earshader also follow the same type of layout as nearly as possible, but Tobson, with the exception of Valasay, is intermediate between a lotted and an unconsolidated township. Croir also differs: it was laid out in 1921 but the disposition of the potential arable forbade a coastwise organisation. The site of Breaclete is greatly broken by lochs and a sea inlet, and consequently an essentially regular layout based along a main Loch Breaclete - Loch Beg Breaclete axis, appears somewhat complicated. The accompanying diagrams contrast the control exercised by physical conditions at Croir with the subordination of physical conditions to a simple lotting plan at Hacklete, (Figure 28).

Within the townships, with the exception of Kirkibost, the distribution of settlement seems to have changed little since the original lottings, for in most cases the sites of the old and present dwellings are little further apart than is dictated by constructional problems. It would appear generally that black houses were universal in the nineteenth century except for the farmhouse at 1 Croir (the oldest 'white' house in Bernera), Thule House, (18 Tobson), possibly the blacksmith's house at 11 Hacklete, the former farmhouses at 20 Kirkibost and at West Earshader. However, with the establishment of Congested Districts Board and of Board of Agriculture grants, housing was improved, early examples being 5 Hacklete and 10 Breaclete. The resettled townships generally had improved accommodation from the start. Improvement has greatly accelerated since 1951. In most cases at the present time housing is of very high standard, only one blackhouse and one near blackhouse are still occupied.

Water supplies and sanitation are less satisfactory. Most crofts by now have their private water supply, thought it is hoped that mains schemes may be constructed within the next few years. Sanitation varies in standard and in places there are still open ditches, but all the newer houses have water closets. It is worth remarking in this connection that tuberculosis is almost eliminated. Electricity has been available since 1952 to all crofts and most are connected, though not necessarily in every room. Cooking is sometimes by electricity but more commonly by Calor gas and a peat-fired range or stove (open or enclosed). Peat is cheap to those able to gather it themselves. Where, however, help is needed to carry the cut and dried peats to the nearest road, difficulties may arise. The cost of hiring labour for peat cutting may be such that it is cheaper to buy coal.

Access to Bernera by road is now comparatively easy. Where formerly Loch Roag provided the highway of communication, the road built to Earshader after the Great War, and the £87,000 bridge to Bernera Island, built in 1953, have caused a revaluation of sites. Linshader is approached by a tarred branch road and the other Bernera shore townships lie upon the narrow and twisting main road, though four of the six Lundale crofts have no connection with it, and two of the Cruilvig crofts, and West Earshader, are somewhat isolated. On Bernera Island the old cart track from the pier at Barraglom across to Tobson and Croir has been somewhat re-aligned since the construction of the bridge. This is a good tarred road, as is part of the branch to crofts 3...8 Croir. The old road to Kirkibost was tarred in 1959, though three outlying crofts near Barraglom were still without a road suited to vehicles, and the branch within Breaclete remained untarred. There is a new road to Hacklete from Breaclete which provides tolerable, though circuitous, communication. Valasay is one of the most isolated settlements in Bernera, linked with Breaclete rather than with Tobson by the footbridge and causeway paid for by Congested Districts Board grant about 1903.

312 There is no piped water supply and after even a short period of dry weather there is a water shortage. One prosperous crofter (where the crofter does weaving and one member of the family is periodically away with a Norwegian whaling fleet) bought a large modern Bendix electric washer only to find that there was not sufficient water to use it except on rare occasions. The croft houses have had electricity since 1954, and even the three remaining inhabited thatched houses now have electricity.

311 Although there are only 4 full-time crofters, most of the crofts are carefully and well worked. Only a few crofts are decaying, and there is a tendency for these to be sub-let to the more agriculturally inclined crofters instead of allowing the land to revert. In addition to the full-time crofters, 31 other men do part-time crofting. Eighteen men weave and this provides their main income, but this figure fluctuates according to the prosperity of the Harris Tweed industry; at present the figure is probably higher than average. Although 32 people have emigrated from the township since 1939 (many of them young people who have married on the mainland), there are still several young people and young families making their homes here. The dominant age-group of permanently resident adults is 15 to 44. Total population is steadily declining, but Callanish has always been a prosperous area and seems likely to remain among the more prosperous crofting communities.

BREASCLETE PARK by Margaret Grice and Doreen J. Phillips.

195 Breasclete Park, also known as New Park, Callanish, was settled by people cleared from Reef in the mid 19th century. Two of the six original crofts have been subdivided, making nine. However, there are only five working units and on one there is no cultivation. There is also a feu house built in 1958.

The crofts, which are fenced, form broad strips perpendicular to the Breasclete-Callanish road. Cultivation is mainly by tractor, oats, potatoes and some clover being grown. One progressive crofter has successfully experimented with re-seeding one acre of grazing land on his own croft. Common pasture for the 148 sheep and 6 cattle is shared with Callanish, and for most purposes the Park can be considered a part of that township.

The total population is 26 of which 4 are permanently away. There are 6 people over 65, and 8 children under 15.

BREASCLETE by Margaret Grice and Doreen J. Phillips.

131 Breasclete is situated on the east side of East Loch Roag on land which rises gently from the seashore to the moorland and is interrupted by rocky outcrops of gneiss in the northern part. It is separated from the township of Callanish to the south, by a small westerly flowing stream, at the mouth of which is the site of a mill.

The road on which most of the houses are situated, follows a curve through the middle of the crofts, but newer houses and some feus have been built along the main Callanish-Cartoway road, nearer to the shore. Stornoway is 18 miles away along this road which is turned throughout. Breasclete could be served by the still unfinished Pentland Road, were it to be properly surfaced and this would make the journey shorter by 4 miles. Two buses in each direction per day connect the township to Stornoway, but high fares make visits to the town infrequent.

312 The township hopes to receive the mains water supply within the next few years, but, at the moment, relies on wells within easy access of most of the houses. Many houses have piped water from private wells, some of which go dry after two or three days good weather although the wells on the lower ground never fail.

weather although the wells on the lower ground never fail. Mains electricity was installed 354 7 years ago, but on the whole cooking is still done by Calor Gas and peat. The chief source of fuel for heating purposes is peat, although a little coal may be used.

427 There are 63 registered crofts, including many subdivisions, a small-holding of 15 acres formerly the Mill, and 10 feus, all of which are worked as 54 units. The crofts lie as long narrow strips in a NE - SW direction from the moorland to the sea. All are at least partly fenced, the fencing being of recent date. Some crofters are, at the moment, making use of fencing grants to enclose their land completely.

241 The only crops grown are oats and potatoes, and although a little clover mixture is sown for hay, many crofters find that the natural grass is sufficient for their needs. Vegetables are produced in a few gardens, but most people do not have enough time or interest to bother with them. Flowers rarely flourish owing to the lack of shelter.

311 Far less of the croft is cultivated now than in the past, and the land nearest the shore, part of which was once cultivated on a run-rig system is now unfenced and used entirely for grazing together with some peat cutting. A piece of the common grazing has been improved by application of shell sand and chemical fertilizers and reseeded. This experiment in which almost the whole township took part has proved very successful and there are plans for further reseeding. Details of crops are given in Appendix C.

Although the tractors of which there are two in the township are used wherever possible, the spade is still used on many small patches, particularly for potatoes. Much hay is cut by mower but scythes are used to a large extent. There is still one horse in the township but it is scarcely ever used for ploughing except by its owner.

233 The total number of sheep kept in the township is 1,500 i.e. 2½ times the souming which here is 2 cows and 5 sheep per £1 sterling rent. 40 crofters keep sheep but none have sufficient to make a livelihood from sheep alone. Many lambs are lost on the moors during the summer and more fail to survive the winter. The number of cattle kept is 84, i.e. only 1/3 of that permitted. It is usual for each household to keep 1 cow and 1 calf which is generally sold after 6 months when a subsidy can be claimed. Breasclete has no bull, but shares the one from Callanish. Most households keep sufficient poultry for their needs but no eggs are marketed.

Shielings were still used to some extent up to 1938. Now it is not necessary as fewer cows are kept than formerly. With the reduction in numbers of stock the common pastures close to the village are being colonised by heather.

221 The crofters' year begins at the end of March when the ditches are cleaned and the land is prepared. In April the ground is ploughed, fertilised and sown with oats and potatoes. The sheep are dipped and by the 10th of May must be out on the moors as the crofts are then closed to common grazings. Soon after this peats are cut on the moors two or three miles from the village. After about 20 days the peats are lifted and carried to the Pentland Road by tractor where they are stacked to await the lorry which takes them to the village.

In June, the sheep are gathered into the fank for shearing and the cows are usually brought to graze on the crofts from the nearby moors. If the croft is not fenced they must be tethered. At the end of June the clover is cut, while the potatoes must be cleaned and hoed. In August the lambs are weaned and dipped. Natural grass is cut for hay and if there is any first year sown grass this may yield a second crop in September, together with the corn harvest. When the potatoes have been lifted in October the crofts are opened and the sheep are brought in for the winter. Final dipping takes place in November.

162 Out of a total resident population of 226, 56 are under 15 years and 57 are over 65 years of age. Of the resident tenants 9 are between 15 and 44 years, 19 are between 44 and 65 years and 26 are over 65 years of age. Twenty on persons are periodically away e.g. students and seasonal workers and 29 are permanently away. Since 1939,

The Village of Shawbost

(Adapted from the Ordinance Survey Map, 1964. Scale: roughly 3" per mile.)

5

000 is the northernmost island in the Outer Hebrides (see
161 Map B). The population is concentrated along the
162
• 361 coast, like a hat-brim around the great inner core
of the island's heather-covered bogland, a population
belt classified as "dense rural" (50-400 persons per
226 square mile) in a map based on the 1951 census. The
pattern of land settlement reflects the importance of
fishing in the economy of the island.

131 Lewis lies between 6°10' and 7°20' west longitude,
and between 47°50' and 58°30' north latitude. Lewis
131 is as far north as Newfoundland and farther north than
132 Mongolia, but the temperature is mild because of the
North Atlantic Drift, or Gulf Stream, which passes the
132 west coast of Scotland. The temperature averages 55°F.
in summer, and 44°F. in January. A constant climatic
feature of life on the treeless island is the wind, a
relentless, insidious presence which often reaches gale
force. Winds of 60 m.p.h. and more are common.

Rain, which comes in downpours or light mist,
133 averages 55 to 65 inches per year. The water may be
held in colloidal suspension with decomposed organic
matter in the compact, spongy material called peat, or
pour as rivers and streams off the island's shelf of
non-porous Archaean gneiss into the sea. Of Lewis'
131 total area of 437,200 acres, inland water comprises
133 24,863 acres.

7

131 Lewis is about 40 miles long. The distance from
Stornoway to the west side of the island is about 15
• 361 miles. Along a tar-macadam road through Barvas parish
491 from its northeast tip toward the southwest, about
18 villages are clustered along a relatively flat coast
for as many miles until the land becomes hilly. The
road then narrows and takes hairpin twists around blind,
361 stony corners. Villages become fewer, and nestle in
protected coves or string haphazardly across the face
of the hills.

Shawbost (from the Norse sia or sio meaning "sea"
(132) and bost or bolstadhr meaning "dwelling" or "homestead"),
a village in the parish of Barvas, lies on three low
hills on the west coast. Shawbost is 18 miles from
Stornoway on a circular route in which Stornoway and
Shawbost are antipodes.

172 On the south side of Shawbost bay, huddled beside
the sea strand, is a cluster of ruins called Sean Bhaile
(the old village), believed to have been occupied over
200 years ago when fishing was important in the local
economy. Banks of the streams are dotted with the ruins
(348) of old grinding mills and ovens for drying grain.
(312) Fresh-water springs are still kept clear of rushes,
although water is now piped to most houses from a nearby
000 loch. Hundreds of place names are known to the villagers

238 finished lengths of tweed. For a tweed to be classified
443 as "Harris Tweed," it must be hand-woven by Outer
(424) Hebrideans in their own homes, but the weavers are
288 essentially employees of the mill. All the large Harris
Tweed mills in Lewis, except the one in Shawbost, are
located in Stornoway. A few smaller businesses, which
design and market tweeds but have no elaborate machinery
to process the tweed further, are scattered throughout
the island.

421 The village of Shawbost is composed of 169 households,
162 of which 110 are headed by "crofters," persons recognized
(427) as legal tenants of a croft. Of the remaining 59
• (361) households, 16 rent houses which were built and are
maintained by the County (called "council houses"),
11 have erected houses on the crofts of relatives, and
463 32 have built homes on the common grazing lands. Non-
241 crofters participate in the agricultural activities of
the township. It would not be unusual, for example, for
a non-crofter to serve as the clerk of a grazings committee.

In North Shawbost, one croft house and two non-
342 croft houses are used only when the owner returns to
162 Shawbost from the mainland for a holiday. The school-
(375) master lives in a house adjoining the school, and the
(423) minister in a manse located between Shawbost and the
neighboring village of Bragar.

who were very much in contact
the Scottish Lowlands, were
ultural practices there. The
-rig, which had once dominated the
to fixed, compact holdings began

he "progressive" ideology of the
land to individual farmers in much
hey had previously held would
gricultural development and give
capitalist farmers. To give land
people, however, meant the removal
tenants who had hitherto been
r the system of run-rig.

175 Factors which led to further crowding were the
423 development of industry and an increased demand for
427 wool in the south, which occurred when traditional
[161] ties between laird and tenant had been loosened. The
clans had been disbanded after the Jacobite rebellions
of 1715 and 1745; those landlords who had not
forfeited their estates received huge sums of money
as compensation for the abolition of hereditary
jurisdiction. They had experienced travel and the
luxuries of other countries, and were not eager to
remain on their estates. They accepted the huge rents
offered to them by sheep farmers to the south, and
turned vast amounts of land into sheep tracts. Tenants
• [361] were crowded together along the seashore, or lived on
tiny holdings dispersed among the larger farms or on
moorland, earning their living by doing wage labor.

175 Despite the factors which encouraged a high level
423 of population to remain on the land, proprietors
241 attempted to destroy the joint farm with its small,
178 dispersed holdings and collective rights. Run-rig
[656] agriculture was abolished in Argyll in 1776 (Day 1918:
180; Gray 1957: 49), and over the next 80 years it
disappeared from the Highlands (cf. Gray 1952: 49-50),
to be replaced by townships of compact holdings
surrounded by undivided hill grazing lands.

175 Geddes (1948: 56) gives evidence that joint farms
178 were abolished in Lewis early in the 19th century.
241 Gray (1952: 50) says that by 1819 there was little
423 run-rig left in Lewis. The factor's notebook for
Breasclete, on the west side of the island, shows the
destruction of clachans around 1850, and their replace-
ment by linear townships.

175 In the Napier Commission's "Evidence" (1884) for
423 the parish of Barvas, it was mentioned that the rent
427 had been increased because of improvements made by the
632 landlord, Sir James Matheson, between 1849 and 1852.
178 Land had been drained and new townships created; and
both old and new townships were lotted and rented in
1850 and 1851 (Napier 1884: 959). The Ordinance Survey
175 map drawn up in 1852-53 reveals several interesting
• 361 features of Shawbost: "New Shawbost" has recently been
423 laid out; and in an area now incorporated by only a
427 few separate crofts on "Carnan," a cluster of houses
178 appears, perhaps the clachan in which joint tenants
lived, and from which they went out to farm their various
strips of land, before Matheson reorganized the land
in linear strips with dispersed housing. The peat banks
[314] in the Carnan area are almost exhausted, indicating a
[194] long period of settlement in this area.

233 were taken out to small huts in the central moorlands
233 for several months during the summer. These moorland
342 dwellings, called sheilings or airidh, were tiny stone
structures, as small as seven by five feet. They had
double stone walls filled with clay, and a rounded
thatched roof. There were two doors opposite each other
in the longer walls, one of which was filled with turf
depending on the direction of the wind. A fireplace
[354] was built into one end of the hut; shelves in the stone
[352] walls held basins of milk and other items; and the major
part of the sheiling constituted a grass-and-heather-lined
• [361] cavity which served as a bed. The sheilings were usually
clustered together near a stream, duplicating neighbor-
hoods within the village.

221 Ploughing and planting were finished in the spring
before the young men and women went off to the fishing,
and before the cattle were taken to the sheiling. Some
families went to the sheiling as early as March for a
"fresh bite" of grass. Many went out in the middle of
May, and returned at the end of July or beginning of
August.

233 "During the week, young girls or boys stayed out on
857 the sheilings, depending on who was available in the
887 family; maybe old people who couldn't do anything else,
462

288 paucity of passengers, which provided rides to and
175 from town many times a day; but with the "development,"
178 that is, the centralization, of industry, public trans-
472 494 portation deteriorated. Visitors to the island unfamiliar
with this history are struck by practices which they
interpret as coming out of a clockless past, such as
the present custom of stopping the bus midway in its
journey to Stornoway so that the driver can eat dinner
in his mother's house while all passengers wait on board.
Such a custom is fairly recent, and indicates the
deterioration of public services to populations which
are marginal to the centralized source of these services.

288 During World War II, when the demand for tweed was
175 high and the number of weavers small, the weavers staged
[468] an effective strike by which they received an increase
in pay and the burden of cartage was shifted from them
[178] to the mills. This did not affect the system of trans-
[494] portation until the mills realized it would be cheaper
to run their own transport rather than to pay the independ-
[493] ent drivers a "cartage fee." The mills then began to use
their own vans to deliver yarn and collect tweeds directly
175 to and from the weavers. Once the mills took over trans-
288 portation, they tended to deliver tweeds to weavers
178 closest to the mills rather than to uphold the principle
[494] of equal distribution. This practice (made possible by
[466]
• [361]

175 the 1934 decision to change the word "crofter" to
178 "islander") led to the weavers living in council
288 • [361] houses in town and working in loomsheds behind the
houses. Unequal distribution has also contributed
to Shawbost's relative prosperity, and to the decline
of weaving in more remote parts of the island. The
[464] unequal distribution of tweeds has made it difficult
to maintain a large labor force, which in turn limits
the growth and development of the industry.

288 3. Instability of the Industry: The Harris Tweed
175 industry has undergone a number of crises. Periods of
178 depression have alternated with periods of prosperity.
[458] (See Appendix B for the fluctuation in the number of
yards stamped each year with the Harris Tweed trade-
mark.) The very conditions which give the tweed its
[435] market value—the decentralized, non-mechanized human
[466] element—also limit the possibilities of growth in the
industry, and contribute to the industry's instability.

288 When a business remains small, it must collect
441 orders before it can provide work to have the orders
filled (except when demand for an item is strong, as
occurred around the time of the previous world war;
during the war and for a few years after, tweeds could
be made first and then marketed, because any cloth
[471] could be sold). Only a large business can keep weavers

Lewis and Harris

A HARRIS VIGNETTE

(2,620 ft); grouped around this are the lesser peaks staring stark 631
and treeless to the skies. At the feet of these hills are the small 133
villages straggled along the shores of West Loch Tarbert. Much
of this area is owned by the proprietors of Amhuinnsuidh Castle,
a magnificent structure built by the Earl of Dunmore in the last
century; the hills lying north of it are rich in red deer. The road [491]
past the castle trundles on until it peters out at the far-east village
of Hushinish, beside a glorious scimitar-like curve of silver sand.
Beyond Hushinish is the Island of Scarp.

631
The road along the shores of East Loch Tarbert ends at the
village of Kyles Scalpay which overlooks Scalpay island. The [491]
Bays of Harris hold in their crevices the scattered groups of houses [361] •
here and there, where an inlet of the rocky coast affords some [133]
anchorage and where a patch of ground is suitable for cultivation.
Tortuous, winding footpaths have been gradually replaced by [487]
narrow roads connecting the townships. Lack of sufficient re- [161]
munerative employment has led to considerable depopulation. [162]
Fifty years ago the population of the area was just over 5,400;
it is now about 2,900.

The south of Harris is better known for its association with
Lord Leverhulme. Obbe, later Leverburgh, became the centre
of his schemes. He built a large pier, huge kippering sheds, houses
for the workers, roads and lighthouses, and blasted away under-
water rocks which hindered free navigation. The bulk of this
work was complete in 1924, but when he died (in 1925) his suc-
cessors, in the cold light of economics, decided to close down the
embryo industry and realise its assets. The harbour works had
cost £250,000; they were sold for £5,000 to a demolition com-
pany. Leverhulme's memorials are still to be seen. The west coast
of Harris is now becoming known for the long stretches of shell
sand and the green machar-land beside it, a true delight for the

A HARRIS VIGNETTE

621
631 has direct or indirect communication with Glasgow, Stornoway
and North Uist. In summer a thrice-daily bus runs to Stornoway,
[505] and once a day a bus makes the round trip of East and West
[494] Harris. The township, linear in pattern, east to west, includes six-
• [361] teen shops which cater for most of the needs of the population
[366] within reasonable travelling distance; it also has two cafés, a
[368] post office, a licensed hotel, a hall for social functions, a
[373] masonic hall and two churches. The Sir E. Scott School here is
the only secondary school in Harris with an academic stream.
Most of the working population is employed in the service in-
dustries, the professions and the tweed industry. Tarbert was a
[504] fishing port of some significance in the past, and is now a re-
fuelling point for ships.

441 The absence of organised industry on a large scale, such as
[167] Lewis has, is a factor which tends to bring nearer to reality any
desire on the part of Harris natives to leave their native soil. There
are small pockets of industry, but these are only dabs of easing
463 ointment on the excessive unemployment sore of 27 per cent. The
[241] main occupation is of course crofting, the income from it being
[134] augmented from a variety of sources. Some crofters concentrate
[126] on the production of Harris Tweed, perhaps using the wool from
[384] their own sheep; the natural dyes from the lichens which grow
on the rocks and from other plants are still used occasionally.
Others specialise in knitwear. Recently shell-craft and wood-turn-
ing have been added to the traditional crafts, with a view to the
[224] tourist market. Fishing, of course, plays a part in the economy in
some communities. The interest of such organisations as the Scot-
tish Country Industries Development Trust has been concen-
trated on the potential in shell-fish processing, and the production
of knitwear on a larger scale than exists at present. Road-
[494] work gives employment to about thirty men, but is of course
seasonal.

A HARRIS VIGNETTE

316
Fourteen employees were directly concerned, with another six in 464
the services sector.

484
The potential of the tourist industry is only beginning to be
tapped. MacBrayne's drive-on drive-off car ferry, with a capacity [505]
of 50 cars and 600 passengers, makes two or three trips a day
between Uig in Skye and Tarbert, the journey taking less than
two hours. The mainstays of tourist accommodation in Harris are 484
the Tarbert and Rodel Hotels, both well appointed and owning 485
fishing rights for salmon and trout. Sea fishing is another tourist 529
attraction. Crofters participate in the holiday trade by offering [226]
full board or bed and breakfast, caravans, caravan sites or vacant
lets.

484
An interesting tourist venture has been started at Rhenigidale.
A rough, stony track, one of the most tortuous and exciting in 487
Britain, takes its leave from the main road over a ridge. It twists 529
and turns in and out of gullies, over cliffsides and across the steep
heather-clad slopes of the Toddum, a dramatic little hill of 1,730 ft
which protects Rhenigidale village from the Atlantic gales. The [205]
seven-mile track is the only marked route, though crofters take
a shorter way to the north over pathless bogs; the local postman
makes a round of about 60 foot miles in the week, walking this
track and on to Tarbert three times in all weathers. The village 504
relies on its sheltered harbour with a good natural rock pier: 361 •
most communication is by water, all food and fuel coming that 505
way. In past times every household owned a boat for lobster and 501
shell fishing to supplement both diet and finances. Today the 226
interest in fishing has declined, as has the population. But in 1946 485
Mr Herbert Gatliff paid his first visit to Harris, discovered what
the island had to offer, and started a campaign to convince
hostelling interests of the need to make some investment in the
Western Isles. A croft house in Rhenigidale was in 1961 equipped
as a hostel, and under what is now the Gatliff Trust it is main-

A HARRIS VIGNETTE

HARRIS'S OFFSHORE ISLANDS

Scarp

• 361 Until 1972 Scarp was the most westerly inhabited island in
Scotland, separated from the Harris mainland by a strait which
is about half a mile across at its narrowest, coursed by strong
[133] tidal currents. The island is about three miles in diameter,
rugged, especially in the north and west, with cliffs on all sides;
the maximum altitude is nearly 1,000 ft. On the east side lies a
361 tiny marginal belt of good land, machar and soil; on this green
311 shelf, about one-third of a mile long, were all the crofts of the
[134] Scarp settlement. Many stand deserted, and abandoned lazy-beds
[241] in sites beyond the present settlement indicate a denser popula-
tion at one time. The island's population-carrying capacity was
severely limited by the minute amount of land available for
tillage: of a total of about seven square miles only half a square
mile can be used. Climatic conditions and soil type also restrict
the range and quality of crops grown.

*175 Scarp was originally settled about 1810 and was occupied by
361 eight farming families who were reasonably comfortable. Not
only did they have the island to themselves, but they had access
to good pasturage on the Harris mainland opposite. About 1823
[166] thirteen small townships between the head of Loch Resort, Harris,
and Bunabhainneader were cleared, some of the displaced families
coming to Scarp. Some emigration back to Harris took place in
the 1840s, but when about 1868 the proprietor divided Scarp into
sixteen crofts instead of the previous eight holdings, these were
further divided by the people themselves, trying to accommodate
their families and friends from elsewhere. In 1861 the population
[162] was 151; the peak was reached in 1881 with 213 persons. In 1951
it was 74. Communication with the Harris mainland is by boat,

A HARRIS VIGNETTE

166 vision of adequate educational facilities in remote spots become
871 increasingly difficult.

In its time Scarp has contributed more per head of populatio
to the professions than has any other community of similar siz
[162] The last of the native Scarp population left the island i
November 1971: two families totalling seven people. The islan
[178] has now attracted the attentions of a hippie community.

Scalpay

*175 Scalpay Island, on the east side of Harris, was formerly occu
• 361 pied by two or three tacksmen in succession before being 'crofte
429 out'. About 1843 the Harris factor settled twenty crofting famili
who managed to make a fair living there, but five years lat
another twenty families were added; some had been evicted fro
the island of Pabbay in the Sound of Harris. This led to some su
[162] division of the available land. The 1861 population was 388, b
the figure rose to a peak of 624 in 1921; in 1951 it had decline
to 541. It is now in the region of 450.

178 Island Scalpay is in fact one of the few places in the Highlan
[6] and Islands area in which the normal trends associated with r
mote regions are operating in reverse. The island despite its sma
[131] ness—it is a mere 3 miles long and 1½ miles across—supports
thriving and dynamic community and is the envy of its neighbou
[162] Scalpay is retaining its young folk; and it boasts some of the fine
homes in the Hebrides. From the agricultural point of view it
[241] not greatly different from other islands in the Hebrides. Its for
crofts produce a good crop of oats; but less than 20 acres of t
land are re-seeded.

226 The land being as poor as it is, the men of Scalpay have turn

175 of beer at one time to avoid having to make the 50-mile
275 round trip very often. Men met to drink in barns or in
273 tigh ceilidh, the houses in which people gathered for evening visiting, but for this purpose eventually built huts of stone or concrete, or used shelters already available such as the shells of old buses or Nissen huts built by the armed forces but no longer used by them. [361] These shelters, separate from the rest of the village, were called bothans. One or a few men brought the drink
275 from town, and the drinks were sold at cost. In 1963
273 a bothan was raided by the police and the men fined.
625 But in 1967, a court case found six men not guilty of
681 trafficking in exciseable liquor because there was no evidence that money had changed hands. The lawyer for the accused men argued that the drink was not "for sale." It was simply available, and drinkers made "voluntary" contributions to a common kitty.

175 The first bothan in Shawbost was started after the
273 second world war, by a sailor home on leave. Liquor was
275 brought to an old Nissen hut, which eventually was replaced by a small concrete hut with gas lighting. ("It was built overnight, because if anyone knew it was being built, they would protest." "It was built inside the Nissen hut so no one would know. On the day they were tearing down the Nissen hut, a minister was passing by and he praised

2 ECOLOGY AND PHYSICAL ENVIRONMENT

361 THE population of the island huddles round the coastline
133 as round a central hearth. This is mainly because the inland parts of the island are either barren, as in Harris, or infertile bog, as in Lewis. Much of the south Hebrides has, on the west coast, the extremely fertile macharland, but Harris and Lewis do not have these useful patches. The macharland is land built on shell sand and dressed with fertilizing seaweed; it forms a fertile fringe, no more than a belt of varying width between the sea and the acid peat bog on the inland side. Where this land does occur, mainly on the west coast of the island, townships crowd round it for the good growing it can give. The other reason for the [262] attraction of the coast is the obvious one: the close proximity, on the doorstep, of a change of diet, shellfish and inshore fish such as whiting, cod, haddock and mackerel. The exceptions to this coastal grouping are Achmore, Cliascro, and Lochganvich in Lewis.

133 There is a great physiographical difference between the east and west coasts of the island, this apart from the incidence of macharland on the west coast. The eastern side is steeper to the sea; though sheer cliffs occur at Gallan Head, West Loch Roag. The south-western coastline has high, almost sheer cliffs with few inlets or sheltered harbourages excepting Loch Roag, a magnificent inlet, sheltered at its farthest inland penetration by Great Bernera. The coast on this island side often presents rocky teeth to the Atlantic's buffeting; and often suddenly falls down to sea level to display wide stretches of sand. Uig Bay, where the Red [463] River runs into the sea, is a breath-taking sweep of whiteness. The eastern coast is generally rocky but has more inlets, lochs which carry townships mainly engaged in fishing or tweed manufacture.

Lewis and Harris

THE CROFTING TOWNSHIP

361 The crofting township is not quite akin to the English or Lowland village. Primarily it is a collection of dwellings of families who, as social units, gain their subsistence from the land surrounding the houses. The smallest number for a township is four
476 family units. A functional unit of four men was the minimum necessary for a boat crew, or for the teamwork necessary to cultivate land; co-operation was essential if all four families were to survive. And from this grew the same spirit of communal work which in Lewis is seen at its best in the efforts to reclaim peat bog and turn it into fertile grassland.

361 Hebridean townships come close to being the nearest approach
[565] to a classless society. The shape of a township is largely dictated by the nature of the surrounding land. The shape of most of those in Harris and in Lewis is either scattered or linear (houses disposed in line at varying distances from each other), with little natural [491] cover, either plantation or scrub. Often the main road runs through the township; some have begun to develop lateral roads, to give, from the air, the appearance of planning on a grid system.
244 Where gardens are cultivated, the produce tends to be a summer vegetable supply for the household, little if any finding its way to
372 Stornoway shops for sale. Peat is the usual fuel, though in townships near to the centres of Tarbert and Stornoway coal is burned; the cost of freight, however, makes it expensive.

471 Most of the townships are owned by commercial companies; individual lairds own some five dozen; the remainder belong to public bodies and trusts. The actual distribution of ownership of land on the island is as follows. Harris is virtually owned by individual lairds; a small percentage is owned by commercial companies. The Lochs region of Lewis has a mixed ownership: commercial companies, lairds, and public trust, the former being the largest. Stornoway parish is wholly owned by public trust. The Ness district is virtually the property of commercial companies; a small fraction belongs to public trust. The Uig district is the same, the smaller proportion, less than 10 per cent, being the concern of an individual laird.

In Lewis, the public body mentioned is the Stornoway Trust,

THE CROFTING TOWNSHIP

In Lewis, the public body mentioned is the Stornoway trust, the only one of its kind in the Highlands: when Lewis was sold by Lord Leverhulme in 1923, the parish of Stornoway Landward was given to the townspeople who, in effect, became shareholders in the trust, formed to administer the estate. A resident factor in Stornoway is answerable to a small council of the residents. Commercial companies as owners appeared on the scene in Lewis after the lands were offered for sale when Leverhulme pulled out of his efforts to industrialise the Lewis folk. Considerable tracts of land were sold for as little as £500; some at 1p per acre. The salmon and trout fishings were, of course, a major attraction. Some small-acreage estates were bought in Harris and Lewis by speculators with island connections.

STORNOWAY

In contrast to the straggling and quite casual townships of the rural areas of the island, Stornoway has logic in its layout. The harbour and the grounds of Lews Castle have given the town a magnificent setting and a useful green belt surrounds it. The outlying villages, however, tend to be miracles of chaos, showing both architectural and planning anarchy. These only serve to add point to the more formal layout of Stornoway with its regular streets, some casual variation adding interest.

The town itself grew in recognisable stages. The first was centred on the small peninsula known as the Point Street area. This land finger protected the inner harbour of the Bayhead River and on it grew the nucleus of the town, beside old Stornoway Castle, once perched on a rocky islet and now existing as rubble under the steamer pier. Protection from storm was not really provided until the nineteenth century, when a quay was built with space for marketing and handling herring. About the seventeenth century, houses began to string themselves out along the shores on the side of the inner harbour (Bayhead Street and Cromwell Street) and on that side of the outer harbour called Newton Street. From the nineteenth century until about 1914, two-storey, flatted tenements, hotels and middle-class houses were built on a grid plan that followed on old field layouts and the associated ditches. Some of the present-day roads, such as James Street, follow these

ECOLOGY AND PHYSICAL ENVIRONMENT

ditches, indicating perhaps the love of old-time planners for following existing lines and patterns. A plan of Stornoway drawn up by a John Wood in 1821 shows the town's development along definite grid lines with a few main streets, most of which were comparatively long and running south-north, seawards to landwards.

In 1918, when Lord Leverhulme made his bid to centralise the scattered, failing fishing industry of the island at Stornoway, he envisaged a further stage for the town. He began to build new houses, and had a grandiose proposal to reopen the diagonal arrangement indicated in John Wood's plan and centre it on some great new building. This fell through on his departure from Lewis; and since then, building here has become much the same as on the Scottish mainland.

In more recent years Stornoway has seen a kind of suburban development with, in particular, a new housing scheme of private dwellings in the same area as that proposed by John Wood. This area also contains the new primary school. A recent estimate of the cost of the building work, involving new houses and municipal facilities, amounted to almost £3 million. Municipal housing has been provided in smaller areas cleared of older houses. Of the 1600 houses in the Burgh, 50 per cent belong to the Burgh Council or the County Council, the balance being private.

THE SHIANT ISLES

Island) and Eilean Mhuire (Mary's Island). The Shiants are the eroded relic of the same age of volcanic activity that formed the strange-looking columns of Staffa and of the Giant's Causeway in Antrim. The mass of cooling molten rock slowly crystallised and changed in composition: the early-formed crystals sank to the bottom, the later ones being found nearer the top. In 1845 one family lived on Garbh Eilean, the largest, which is joined to Eilean an Tigh by a low storm beach; but the family was lost, falling over one of the great precipices which are a feature of the group. In 1821, 2 males and 4 females lived there; in 1891, 3 males and 5 females; and in 1901, 4 males and 4 females. But in this year the last family upped and went to Tarbert, Harris; for one of its members, a girl of 21, it was the first visit to the outside world. Since then there has been no permanent population. Back between 1811 and 1821 a visitor to the Shiants had some hard things to say about the filth and darkness of the shepherd's dwelling in contrast with the 'loveliness of nature, the bright sand, the fair rock, the enamelled green turf, and the sweetness of the summer breeze'.

Records show that at one time in the islands' history some sixteen people lived there, working small crofts. The ruins of their chapel can still be seen. The author Sir Compton MacKenzie had the house on Eilean an Tigh renovated for a stay there, and later the islands were bought by Nigel Nicholson, author and publisher. Today they are used for grazing sheep.

St Kilda

The St Kilda group of islands, some 45 miles off the west coast of Lewis, belong to the parish of Harris. These islands have an extensive literature and can only be touched on here. When the population was evacuated from St Kilda in 1930, the move broke for all time almost 2,000 years of continuous island living; they were taken off at their own request, after much careful and serious deliberation by the St Kilda 'parliament'. Life in Hirta, the only island in the group with a permanent human settlement, depended on the seabirds that breed in their tens of thousands on the cliffs of Hirta and Boreray, and the great stacks of Stac an Armin and Stac Lee. The flesh of puffins, gannets and fulmars

and to show their friends at home, that they had braved the hazardous Atlantic seas to visit St Kilda on the very edge of the world. The tourists were charitable, but this brought a psychological evil in its wake. In 1886, Robert Connel wrote: 'One cannot be long on the island without discovering the great moral injury that tourists and sentimentalists and yachtsmen, with pocketsful of money, are working upon a kindly and simple people.' It was estimated that the islanders collectively derived a profit of 5s from each of the 200 or more tourists who arrived during the short summer.

The new influx of cash into a community which required money as an exchange commodity because the original native produce was becoming less saleable, hastened the decline of effort to be self-supporting. The numbers of seabirds slaughtered steadily fell; paraffin oil replaced the traditional bird oil in St Kildan lamps. The need for daily work, to toil in fellowship with others, was dissipated; the islanders could purchase most of the food they required, provided communications with the mainland were maintained. The population was in any case dwindling, as St Kildans became more aware of 'the other life' available on the mainland of Britain.

Finally, on a misty summer's day in August 1930, at a cost to the nation of little under £1,000, St Kilda was left to the care and keeping of the changeless Atlantic. It is now preserved by the National Trust for Scotland as a crumbling monument to a small human tragedy of a kind that has been repeated, and will be repeated, in other small communities who cannot argue out the case for their survival in terms of economic viability. The island is now occupied by military personnel in connection with the Hebridean rocket range on South Uist.

St Kildans were described by Dean Monro, in 1549, as 'simple, poor folk, scarece learned in any religion'. In 1698, Martin Martin published *A Late Voyage to St Kilda*. He went there in the company of a minister who had been summoned to the island to denounce a certain false prophet who had risen among the 180 inhabitants (pretending he was an emissary of St John the Baptist). Martin found, as did later visitors, that the island economy and the quality of its life were closely dependent upon its birds,

The Lewis village of Laxay on Loch Erisort

THE OTHER ISLANDS

13 north-west of Gallan Head. There are seven main islands, all
[133] small, high and cliffbound, and a number of rock stacks and
[361] islets. All are uninhabited. Eilean Mhor, the largest, of 39 acres,
[502] has an automatic light. Dean Monro's description of the
133 islands as 'nouder manurit, nor inhabit, but full of grein high
236 hills and scheipe' still holds, for sheep are taken annually from
Lewis to the grazing on the Flannans. Their name is said to be
103 derived from the ninth-century St Flann, whose saintly influence
236 was recognised during the centuries when men from Lewis visited
223 the islands for their harvest of wool, wild fowl and feathers.

*175 The Flannans were the scene of a great sea-mystery: the com-
502 plete and utter disappearance of three men from the lighthouse at the turn of this century. In December 1900, the lighthouse, with its 140,000-candlepower beam 283 ft above sea level, was a year old. It had taken four years to build instead of the estimated two. All the materials had to be swung up piecemeal from the boats and hauled up the almost sheer 70 ft cliffs to the top. That month a passing ship, the *Archer*, noticed that the Flannans light was out; a message was sent to the Flannans shore station at Breasclete, Lewis, and the *Hesperus*, preparing to pay a Christmas visit to the lighthouse, got under weigh.

Its crew landed and searched the island, but found no trace of the missing keepers. In the lighthouse was an uncanny silence. The fire was dead. The clock had stopped ticking. The beds had been made up in the clean, clinical way of all sailors. And in the galley, the pots, pans and dishes sparkled their welcome to the searchers. In the lamp-room the lamp was cold. The wicks had been trimmed and the lenses polished. The logbook showed a last entry on 0900 hours, Saturday 15 December. In the subsequent investigation some theories were offered in explanation of the disappearance, but none quite fitted. The mystery remains, a haunting, unexorcised cloud hovering over the island.

131 *The Shiant Isles*

Turning to the east coast of Lewis, in the parish of Lochs are
[103] the Shiant Isles, about 4 miles off-shore, across the Sound of
[631] Shiant (Gaelic: charmed, enchanted). There are three islands in the group: Eilean an Tigh (House Island), Garbh Eilean (Rough

2,620 ft); grouped around this are the lesser peaks staring stark nd treeless to the skies. At the feet of these hills are the small illages straggled along the shores of West Loch Tarbert. Much f this area is owned by the proprietors of Amhuinnsuidh Castle, magnificent structure built by the Earl of Dunmore in the last entury; the hills lying north of it are rich in red deer. The road ast the castle trundles on until it peters out at the far-east village f Hushinish, beside a glorious scimitar-like curve of silver sand. Beyond Hushinish is the Island of Scarp.

The road along the shores of East Loch Tarbert ends at the illage of Kyles Scalpay which overlooks Scalpay island. The Bays of Harris hold in their crevices the scattered groups of houses here and there, where an inlet of the rocky coast affords some anchorage and where a patch of ground is suitable for cultivation. Tortuous, winding footpaths have been gradually replaced by narrow roads connecting the townships. Lack of sufficient remunerative employment has led to considerable depopulation. Fifty years ago the population of the area was just over 5,400; t is now about 2,900.

The south of Harris is better known for its association with Lord Leverhulme. Obbe, later Leverburgh, became the centre of his schemes. He built a large pier, huge kippering sheds, houses for the workers, roads and lighthouses, and blasted away underwater rocks which hindered free navigation. The bulk of this work was complete in 1924, but when he died (in 1925) his successors, in the cold light of economics, decided to close down the embryo industry and realise its assets. The harbour works had cost £250,000; they were sold for £5,000 to a demolition company. Leverhulme's memorials are still to be seen. The west coast of Harris is now becoming known for the long stretches of shell sand and the green machar-land beside it, a true delight for the tourist seeking isolation.

Tarbert is the central village in Harris, with a population of about 400. It is a thriving community, nestling at the foot of Beinn an Teanga and at the head of the sheltered anchorage of East Loch Tarbert—sheltered from the prevailing south-westerly winds and from the Atlantic storms. The car ferries give direct contact with the Scottish mainland, via Skye, and Tarbert also

has direct or indirect communication with Glasgow, Stornoway and North Uist. In summer a thrice-daily bus runs to Stornoway, and once a day a bus makes the round trip of East and West Harris. The township, linear in pattern, east to west, includes sixteen shops which cater for most of the needs of the population within reasonable travelling distance; it also has two cafés, a post office, a licensed hotel, a hall for social functions, a masonic hall and two churches. The Sir E. Scott School here is the only secondary school in Harris with an academic stream. Most of the working population is employed in the service industries, the professions and the tweed industry. Tarbert was a fishing port of some significance in the past, and is now a refuelling point for ships.

The absence of organised industry on a large scale, such as Lewis has, is a factor which tends to bring nearer to reality any desire on the part of Harris natives to leave their native soil. There are small pockets of industry, but these are only dabs of easing ointment on the excessive unemployment sore of 27 per cent. The main occupation is of course crofting, the income from it being augmented from a variety of sources. Some crofters concentrate on the production of Harris Tweed, perhaps using the wool from their own sheep; the natural dyes from the lichens which grow on the rocks and from other plants are still used occasionally. Others specialise in knitwear. Recently shell-craft and wood-turning have been added to the traditional crafts, with a view to the tourist market. Fishing, of course, plays a part in the economy in some communities. The interest of such organisations as the Scottish Country Industries Development Trust has been concentrated on the potential in shell-fish processing, and the production of knitwear on a larger scale than exists at present. Roadwork gives employment to about thirty men, but is of course seasonal.

An apparently bright light on the employment horizon showed itself in 1965, with the opening of a quarry at Lingerbay. The mineral quarried was anorthosite, a white granite used as an abrasive in cleaning products. A 99-year lease was taken out by a subsidiary company of William Robertson (Shipowners) Limited, Glasgow. But the quarry was closed in 1967 due to lack of orders.

Fourteen employees were directly concerned, with another six in the services sector.

The potential of the tourist industry is only beginning to be tapped. MacBrayne's drive-on drive-off car ferry, with a capacity of 50 cars and 600 passengers, makes two or three trips a day between Uig in Skye and Tarbert, the journey taking less than two hours. The mainstays of tourist accommodation in Harris are the Tarbert and Rodel Hotels, both well appointed and owning fishing rights for salmon and trout. Sea fishing is another tourist attraction. Crofters participate in the holiday trade by offering full board or bed and breakfast, caravans, caravan sites or vacant lets.

An interesting tourist venture has been started at Rhenigidale. A rough, stony track, one of the most tortuous and exciting in Britain, takes its leave from the main road over a ridge. It twists and turns in and out of gullies, over cliffsides and across the steep heather-clad slopes of the Toddum, a dramatic little hill of 1,730 ft which protects Rhenigidale village from the Atlantic gales. The seven-mile track is the only marked route, though crofters take a shorter way to the north over pathless bogs; the local postman makes a round of about 60 foot miles in the week, walking this track and on to Tarbert three times in all weathers. The village relies on its sheltered harbour with a good natural rock pier: most communication is by water, all food and fuel coming that way. In past times every household owned a boat for lobster and shell fishing to supplement both diet and finances. Today the interest in fishing has declined, as has the population. But in 1946 Mr Herbert Gatliff paid his first visit to Harris, discovered what the island had to offer, and started a campaign to convince hostelling interests of the need to make some investment in the Western Isles. A croft house in Rhenigidale was in 1961 equipped as a hostel, and under what is now the Gatliff Trust it is maintained for hardy trekkers, the Scottish Youth Hostels Association making a grant for running costs. Many visitors have found that the place offers a degree of happiness corresponding with its remoteness from civilisation.

HARRIS'S OFFSHORE ISLANDS

Scarp

Until 1972 Scarp was the most westerly inhabited island in Scotland, separated from the Harris mainland by a strait which is about half a mile across at its narrowest, coursed by strong tidal currents. The island is about three miles in diameter, rugged, especially in the north and west, with cliffs on all sides; the maximum altitude is nearly 1,000 ft. On the east side lies a tiny marginal belt of good land, machar and soil; on this green shelf, about one-third of a mile long, were all the crofts of the Scarp settlement. Many stand deserted, and abandoned lazy-beds in sites beyond the present settlement indicate a denser population at one time. The island's population-carrying capacity was severely limited by the minute amount of land available for tillage: of a total of about seven square miles only half a square mile can be used. Climatic conditions and soil type also restrict the range and quality of crops grown.

Scarp was originally settled about 1810 and was occupied by eight farming families who were reasonably comfortable. Not only did they have the island to themselves, but they had access to good pasturage on the Harris mainland opposite. About 1823 thirteen small townships between the head of Loch Resort, Harris, and Bunabhainneader were cleared, some of the displaced families coming to Scarp. Some emigration back to Harris took place in the 1840s, but when about 1868 the proprietor divided Scarp into sixteen crofts instead of the previous eight holdings, these were further divided by the people themselves, trying to accommodate their families and friends from elsewhere. In 1861 the population was 151; the peak was reached in 1881 with 213 persons. In 1951 it was 74. Communication with the Harris mainland is by boat, plying between two stone-built jetties.

The local economy was essentially a subsistence one, with self-sufficiency in such products as potatoes, turnips, cabbages, oats, milk and fish. After a break of some years lobster-fishing has recently been reinstated as an occupation. Oil lamps are the only lighting, though a few houses have piped water. The small shop

vision of adequate educational facilities in remote spots becomes increasingly difficult.

In its time Scarp has contributed more per head of population to the professions than has any other community of similar size. The last of the native Scarp population left the island in November 1971 : two families totalling seven people. The island has now attracted the attentions of a hippie community.

Scalpay

Scalpay Island, on the east side of Harris, was formerly occupied by two or three tacksmen in succession before being 'crofted out'. About 1843 the Harris factor settled twenty crofting families who managed to make a fair living there, but five years later another twenty families were added; some had been evicted from the island of Pabbay in the Sound of Harris. This led to some subdivision of the available land. The 1861 population was 388, but the figure rose to a peak of 624 in 1921; in 1951 it had declined to 541. It is now in the region of 450.

Island Scalpay is in fact one of the few places in the Highlands and Islands area in which the normal trends associated with remote regions are operating in reverse. The island despite its smallness—it is a mere 3 miles long and 1½ miles across—supports a thriving and dynamic community and is the envy of its neighbours. Scalpay is retaining its young folk; and it boasts some of the finest homes in the Hebrides. From the agricultural point of view it is not greatly different from other islands in the Hebrides. Its forty crofts produce a good crop of oats; but less than 20 acres of the land are re-seeded.

The land being as poor as it is, the men of Scalpay have turned their faces to the sea—for a living, not for emigration. Scalpay has the largest number of full-time fishermen and a total of thirty-three boats, twelve of which are ringnetters of over 40 ft. Native enterprise is also shown in the ship-owning firm whose vessels carry freight and passengers to many parts of Scotland and on occasion to the Continent. A Harbour Association was formed on the island in 1966 to work for local amenities for fishermen and

the community generally—in particular for a landing stage in the North Harbour. The lighthouse at Eilean Glas, Scalpay, was in fact erected as long ago as 1788; for a long time it was the only lighthouse in the Western Isles. In 1792 it was described as 'one of great utility to the numerous shipping that frequent this channel [between Skye and the Long Island] on their voyages to and from the Baltic'.

The independence of the islanders again appears in their attitude to the education facilities provided for their children. In 1949 Scalpay parents staged a school strike in protest against the delay in the construction of a road to the school. At present the island has a junior secondary school but in 1966 the Inverness-shire County Council Education Committee proposed the transfer of the island pupils to the school at Tarbert; this would mean each child rising early in the morning to face a trip across Scalpay Sound and then a road journey to Tarbert. The inevitable protests against this proposal were rooted in its deeper implications. The school roll on Scalpay (70 pupils) has maintained a remarkable level of continuity over the years, reflecting the general prosperity of the island. Forced attendance at a central educational facility, the islanders maintain, will introduce an unsettling urban element into their children's adult views.

The smaller islands

To the west of Scalpay, in East Loch Tarbert, is the one-square-mile island of Scotosay. Its population was 14 in 1861, none in 1881, 18 in 1891, 15 in 1901, and 20 in 1911. In 1921 7 males and 12 females lived there, but none permanently since.

On the west of the Harris mainland is a high rocky island, four miles by one, called Taransay. In 1549 Dean Monro described it as being 'well inhabit and manurit', a place where people delved with spades, and with good barley and corn, and fishing. There are two old chapels and a burying ground on the island. The population of Taransay has declined to a handful through the years; its peak was 76 in 1911.

The Sound of Harris is 'a chaos of rocks and islands', so numerous that they cannot easily be counted. Some are mere pinpoints of rock; others once supported small populations. Nearest to the

Nearest to the southern shore of Harris is the verdant arable island of Ensay, two miles in circumference. The peak population was 15 in 1861, but in 1951 and 1961 there were two men (seasonal shepherds). Just south of Ensay is Killegray, two miles long. The south end was uncultivated, though a good source of peat; five people lived on Killegray in 1861, 3 in 1911 and 1921, 5 in 1931 and none in 1951. An 1865 report mentions that there was only one house on the island, so the population must have been one family only.

Four to five miles west of Killegray is a low-lying, fertile island of about four miles by 1½. This is Bernera Harris which, though lying nearer to North Uist, is included in the civil parish of Harris. It still carries a fairly large population. Until the early eighteenth century it was occupied by a tacksman at one end and a community of crofters at the other. Later there was an influx of people evicted from Pabbay and the mainland of Harris. Some clearing of families from Bernera itself took place. In 1861 the population of Bernera was 315; it rose to 524 in 1901. Three schools were open on the island in 1865 : an SSPCK school, a Gaelic School Society school, and a 'female industrial school' supported by the SSPCK and 'taught by a venerable Highland lady in receipt of a salary of £8 per annum'. The school was housed in, to quote an 1865 report, 'the oldest dwelling in the Long Island, and was at one time inhabited by persons of distinction. In the outer wall is a marble slab bearing this inscription : "Hic Natus est/Illustris Ille/Normannus MacLeod/De Bernera/Eques Auratus." (Here was born that famous man, Norman MacLeod of Berneray, a distinguished knight.) This illustrious personage and his brother, Sir Roderick of Talisker, were both knighted by Charles II for distinguished services . . . A grandson of Sir Norman became known in the annals of the Bench as Lord Bannatyne.'

Three miles north-west of Bernera is Pabbay, also in the parish of Harris. At one time Pabbay was a rich green island, the 'granary of Harris', and supported a considerable population. Early last century it was inhabited by 26 families (about 100 people), who lived in comparative comfort, and by 1841 the population was 338. But Pabbay was cleared of its people. Some emigrated to Australia, some went to other places nearby, such as Scalpay, Bernera and the Bays area of Harris. In 1858 only a

 [See pp. 59-60--Analyst]

shepherd's family was left. Pabbay is conical in shape, and about 2½ miles in diameter. In recent times drift and sea spray have damaged its fertility.

Just north of Pabbay is Shillay, one mile in circumference, where Martin Martin (1695) says he found sheep with the biggest horns he had ever seen. Whether Shillay was ever inhabited is not known.

10 THE OTHER ISLANDS

THE continued evacuation of islands is a problem peculiar to Scotland. In the eighteenth century some 8 per cent of Scots lived on islands; today the figure is less than 2 per cent. Island populations today account for about 30 per cent of the total Highland (crofting counties) population. The difficulty for most islands is the relationship between population density and potential for economic development.

As though reflecting the relationship of man to man on Lewis-with-Harris—keeping together in community for survival—the other islands round the larger island mass have played some role at one time or another in recorded history. Most of the socially-significant islands of Harris have been described in Chapter 9. Lewis has very few, and these are mostly far-flung oceanic outliers.

North Rona

To begin at the northern point of the Lewis parish, about 45 miles NNE of the Butt of Lewis is North Rona, a block of hornblende schist with pegmatite intrusions. Though the island has never figured in any Census reports, since the Census began, it has been inhabited from time to time. Of about 300 acres in extent, it is cliff-bound and reaches 355 ft at its highest point. It lies in a part of the Atlantic where a deep swell seems perpetual, and landings can be difficult.

Dean Monro comments: 'Towards the north northeist from Lewis, three score myles of sea, lyes and little ile callit Roney, laiche maine land, inhabit and manurit be simple people, scant of ony religione.' The Dean's 'simple people' were no recent settlers. They were in fact the continuation of a community which had inhabited North Rona for at least 700 years previously. Tradition has it that the first inhabitant was St Ronan, who built a small monastic cell or hermitage there some time during the eighth century, but there may have been earlier inhabitants.

Dean Monro, in his 1549 account, refers to the vast numbers of wild fowl and mentions that the men of Ness sail there and stay for seven or eight days and bring back a boat full of dried wild fowl and feathers. The *Old Statistical Account* (1796) says: 'There is in Ness a most adventurous set of people who, for a few years back, at the hazard of their lives, went there in an open six-oared boat without even the aid of a compass.' The boat, says the *Account*, could not be pulled up out of the sea, and therefore, while some of the men worked on the birds, the others had to stay in the boat on the most sheltered side of the sheer-cliffed island. This custom of hunting young gannets (or 'guga') on Sulasgeir still continues. Under the Protection of Wild Birds Act, 1954, the gannet is protected by law, but so that the Ness men could continue their old custom, a Statutory Order was passed making a special exemption (from 31 August each year at the end of the close season) of the gannets on Sulasgeir. With North Rona, Sulasgeir is one of the great breeding grounds for British oceanic seabirds.

The Loch Roag islands

The one large inhabited island off the Lewis coast is Great Bernera, though technically it is not now an island, having been connected to the mainland of Lewis in 1953 by a bridge. It is part of the parish of Uig, as are the other islands in Loch Roag. Its population reached a peak of 730 in 1911, but has now fallen to about half that figure. Off the west of Great Bernera is Little Bernera, which in Dean Monro's time was 'inhabit and manurit', but which has had no population recorded since the 1861 Census. Monro describes it as full of rough little craigs, but with fertile earth between.

Also in Loch Roag are three islands which, now deserted, once supported families: Pabbay had 17 people in 1861, 9 in 1881, and none since; Vacsay had nine men in 1861, and none since; Orasay in 1891 had one man and one woman, but none since.

The Flannans

Belonging again to the parish of Uig is the group of islands known as the Flannans, or Seven Hunters, some twenty miles

18 621 174 423 pastoral group, the germ (in the Hebrides) of the present township with its common grazing. Hamlets and township formed circles of cultural and religious life in common. These 'sociable hamlets', or 'little commonwealths', as they were called by understanding writers on the Highlands, lived on in the Hebrides almost until a century ago. Features of their form and life have long been known, but their life has not yet been envisaged in its full dynamic significance.

127 361 174 The homesteads, informally grouped in these small hamlets, have been mistakenly described as solitary or 'dispersed' by scholars accustomed to larger and more compact grouping. The mistake was made by geographers of the nineteenth century, such as Meitzen with reference [423] to the hamlets of Brittany. Similarly, because of the [476] small number composing a typical joint team, the vital fact of team-work and joint holding has frequently been overlooked; yet a fundamental mistake is made when such close-knit team-work and joint tenure are described as 174 'individualistic'. Moreover, these teams were linked together in larger, more loosely bound pastoral communities 621 of township and district. In Scotland and elsewhere, it is 631 true, such hamlets came historically to be split up in various [241] ways, into smaller farms and scattered cottages. The larger link of common life was also superseded by the [178] proprietor's estate. Indeed, the twofold revolution involved caused a fundamental regional cleavage within 'the North and West'.

[182] Partly as a result of their small size, the tenure of farm-hamlets was frequently informal. In northern England, [184] the hamlets and their lands were not entered in Domesday Book; still less are early entries complete in Scotland. [178] For this and other reasons, jurist and historian may fail

■ 6·4 to 8·2 (7·1)

(b) Per Full-time Small Holding
• 0·7 to 1·0 (0·85)

(The numbers in brackets are the averages for Scotland.)

241 and with the addition of 10,000 workers on full-time small-
162 holdings, these constitute a labour force of nearly 100,000.
464 Nevertheless, there are more crofts than farms in Scotland, and more small (part-time) crofters than farmers, besides
241 'full-time small-holders', of whom so many are crofters, north of the Highland line. Thus the number of crofter
427 families forms an important item of Scotland's rural popu-
162 lation. Of these, the families of Lewis-and-Harris form fully one-fifth, owing to the remarkable growth of population until 1925. Even in the little burgh of Stornoway many families hold a plot of land, and at heart they may be almost as much 'crofters' as townsmen.

241 Socially, what is meant in the Island by the term
427 'crofters'? Although each Island crofter cultivates his
621 own arable holding (his croft), he shares the common pastures with fellow-crofters, each having a right to a 'sum' of so much stock, 'his souming'. Open, sandy land by the shore, if any, may also be shared. These common grazings, shared together by the crofters of one community—a hamlet, a village or township—form a social link of great significance. They distinguish what we shall call 'township crofting' from individual holding, whether of part-time or full-time small-holdings, or of true farms. The common grazings, enclosed by line C (Fig. 2), thus
• [361] form an important social index. About 75 per cent of the area included forms Common (or other Crofters') Grazings. The close dots of the dotted line divide the 'Commons' from Deer Forests, as in the Island and inland from the north-western coasts. Widely spaced dots divide the Commons from the Sheep Farms and other mixed holdings further south.

241 Outside the tract of 'township crofting' in the north
361 and west, the chief unit of Scots rural life is the farm,

i [see p. 16 -- analyst]

241 with its tied cottages and frequently a 'bothy' for the un-
• 361 married. Next to this comes the full-time small-holding,
[184] important in the North-east and the Southern Highlands of Scotland. Great as are the differences between these types of unit today, they go back, to a considerable extent,
[174] to common origins. The sites of the farms are ancient. And their people, though since divided into masters and men, are the successors to those who were once the 'kindly co-operators' of older 'farm groups', of Lowland *ferm-toun* and
[184] Gaelic *baile* (pronounced like 'ballie'). The island counterpart of these, and their life, will be described in Part Two. Hence, before we turn to further analysis of the Highlands and Isles, a word more should be said of Lowland types.

241 An important social index in the Lowlands of Scotland
361 is the number composing the farm labour-team, averaged
464 for each county. Villages and even hamlets are few, largely because farmers and farm servants live on the farms.
[171] Compared to those of most of England, Scots labour-teams are small. Yet, as the map indicates, there is a
[184] wide range from the 'large' teams of South-east Scotland, through the 'medium' teams of adjacent areas, to the 'small' teams of the West and North-east. Not only do the contacts of employer with employees partly depend upon the number in the team, but so do the farm servants' relations to one another. On the whole, the larger the team, the more formal its organisation; and the smaller
[554] the team, the greater a worker's own responsibility. The
[178] 'family farmer' of the West and North-east is often an ex-farm servant. From Burns's time, his character and enterprise have been recognised in Scotland, and in the last forty years have become well known in South-east England. But the isolation of these little farms brought its problems and its hardships.

/facing p. 48/

174 The historical aspect of these regional facts is extremely
184 significant to the evolution of Scots social life, and to
179 developments of Presbyterian worship led by Elders in
55 ferm-toun and Kirk; although suggested by comparisons
128 throughout this book, they have still to be seriously followed
121 out. As to the future, regrouping of our somewhat
185 scattered agricultural population has been strongly urged in planning for post-war housing and community life. But sound planning must be based on survey, long overdue; though elementary, this key map appears to be the first of its kind for Scotland (Fig. 2). It is from these units of farm-team and township that Scots rural society must be rebuilt, region by region.

184 One further contrast between the farming and the
241 crofting communities demands attention: it lies in the
361 types of migration—one is tempted to say, of semi-
166 nomadism. Crofters, though they move to and from their croft and township—to the city, the sea, or the New World —return home to their native township when they can, and to no other. Many farm servants, on the other hand, though they usually spend their lives in the county or region of their birth, have been on the move from farm to farm, year after year. What is true of Lowland Scotland seems rather true of North-east England, but not of 'the
(164) English Plain'. Unmarried Scots farm servants were hired for the half-year, and frequently moved after each new hiring, the married once a year. Families were annually uprooted—if indeed they could be said to strike root at all!
[122] The war-time 'Standstill' Order for Scotland began to
[178] check this migratory life; but its effects remain. Hence many men have few ties, their wives still fewer. The children could not grow up with their schoolmates: they could look back to no "Auld Lang Syne", of which the

his section are developed in A. Geddes (1938–54). be found in the Bibliography.

3. *The Significance of Lewis-and-Harris*

181 184 361 101 [197] [178]

The Highlands and Western Isles today, "The Land of the Gael", may thus be grouped as two regions. The North-west is mainly of 'township crofting' and distant from the Lowlands—the other mainly of farming, living nearer to the Lowlands and in touch with them. Throughout the North-west, Gaelic is still the common speech, even of the children. The old community feeling is strong; it is that, indeed, which keeps the people attached to the villages.

101 131 [496]

From the plains and cities of the South it is a far cry to *Ultima Thule*, as Lewis, like Zetland, is sometimes called even by its own people. Lying some twenty-five to thirty miles across the Minch from the mainland, its nearest links with the South lie even farther away. From Stornoway it is some seventy-five miles to Kyle of Lochalsh, the railhead for Inverness and North-east Scotland, and 100 miles to Mallaig, the railhead for Fort William and Glasgow. To reach Stornoway over the moors from the west coast townships is itself a journey. Stornoway is the Island's only port, though passengers are put off at Tarbert, at Stockinish and at Rodel in Harris. Isolation has always been a dominant factor in the Island's life. From prehistory through the Middle Ages to modern times, that factor played its changing part.

[504] [177] [178]

178

In Lewis, conditions had changed less than elsewhere during the last century; for example, the *New Statistical Account* of South-west Argyll in 1830-35 reads like a description of conditions in Lewis as they were until after 1914! Hence, as already said, the contrasts are very great indeed in the aspect of the country, its fields and houses, and in the number, character and ways of the people. It

175 reclamation, which Dean Monro has described as he saw it.
311 Technique and economic return must be balanced against
185 the factors of nature. Although natural conditions are
[182] difficult, they may not form a complete explanation of the relative arrest of reclamation in the nineteenth century; for here separation from the agricultural advances of the Lowlands by barriers of mountain and sea caused the retention of unprogressive methods until the wave of agricultural improvement had spent itself by the middle of
[178] last century. To this cause must be added other influences
[171] contrasted to those leading to peasant advance in the rest of Western Europe: the political history of the Gaeldom after 1745, the revolution in land tenure and in the social life of the upper classes, the commercial, industrial and imperial development of Great Britain. All these factors help to explain the contrast offered to the Lews by western Denmark and western Norway, lands in which the soil and climate are comparable to those of the Island. Yet reclamation is proceeding, as on skinned land at Ness, where plots of ground have been steadily broken in by pick and by spade or plough.

226 Settlement and agricultural land are placed around the coasts with their fishing grounds. In spite of what
• [361] was often said—that the Lewisman is and has always been
[311] primarily a fisherman—fishing alone is not enough to
[241] account for this distribution, for the agricultural conditions on the whole are also best along the coasts, or were so for early settlers. As Stevens remarked, the light sandy 'machar' lands are there, and the fringe of partially improved soil close by; drainage is, on the whole, better, while shell-sand and sea-ware are to be had for manure.
241 The sea-ware also serves still as fodder, while one or two
824 sorts are sometimes cooked for human food; carragheen

342 yard and occasionally a barley-kiln in which to dry grai
343 before malting it for home-brewed beer. A 'black mill
351 with its primitive horizontal water-wheel, stands apart b
[251] some burnside.
[273] Round the circular hearth, a large company can assembl
in very social fashion for talk, story and song, the meetin
354 *together* (*ceilidh*). By the transfer of the hearth from th
571 centre and the substitution of a gable fireplace and regula
538 chimney, the social circle is halved, while meantime th
[178] tales of the *ceilidh* are forbidden or forgotten. Happil
the bench still stands against the wall, near to the ope
[353] door, through which neighbours slip in with a word o
greeting to find a customary welcome.

342 The dwellings on the summer pastures out on th
moors show great variety, illustrated in Fig. 10(B). A simpl
• 361 type in use is built of turf and stones, lightly roofed wit
[178] turf placed on spars. A more primitive 'beehive' typ
(which fell out of use before 1900) was stone-built an
[171] corbelled, probably for lack of timber. And whereas th
lighter type always stands by itself, the corbelled type wa
added to until a dozen cells formed a single mass, suggestiv
of ancient 'neolithic' hamlets as at Skara Brae in Orkney
described by Childe, and of the domed, corbelled huts o
the ancient East.

[343] A further type was the 'spring house' of Tolsta, NE
Lewis, in which both cattle and folk sheltered in spring
little way from the village, before going out to the mor
[124] distant moor. Mr. Donald Macdonald, F.R.S.G.S.,
[178] native of Tolsta, informs me that the spring house was i
use until 1936. He remembers vividly how life in th
shieling restored health and colour after the winter.

summits of up to 2622 feet. South of this chain of hills the ground drops again on a peninsula some twelve miles long and only seven miles wide. This forms the more populous part of Harris with its 'sandy shore', the Machar, facing the Atlantic, and its rocky bays and fishing hamlets on the Minch.[1] Lewis has its 'machars' too, areas of white shell sand, which is so light that it blows up the hillsides, thus improving the pasture-land; but there is little 'machar' on the eastern coast, save for the south-western shores of the great sandy North or Broad Bay, enclosed by the peninsula of I, or Eye, which also acts as the outer breakwater for the harbour of Stornoway.

Landing at Stornoway and leaving behind us the pines, and the wind-pruned sycamore woods around Lews Castle, we find ourselves among the small fields of the villages which are partly suburban to Stornoway. Inland stretch the gently rolling, brown and somewhat melancholy moors that cover so much of the Lews. From the Butt of Lewis to the beginning of the Harris hills one could make a bee-line SSW., midway through the Island for over thirty miles, without passing a house or a strip of corn, and seeing only a tiny, ramshackle hut, a shieling (or *àirigh*), used for six weeks in the year when the cattle are taken to the summer pasture. All the villages are in sight of the sea, and generally close to it, with only one inland exception, Achmore, south-west of Stornoway, founded after 1850. The hills of Harris are not less lonely than the moors of the Lews.

Diversity is one of the fascinations of such an island as this. Although, like the founders of Stornoway, all

[1] *Am machair* ('ch' as in 'loch', also anglicised as 'macher'), n.f. the plain, smooth beach-land or links. A sandy beach or ebb-strand, *tràigh*, n.f., backed by *machair*, contrasts with a pebbly beach, *cladach*, n.m., backed by rougher beach-land, as in the Cladach district of W. Lewis.

133 Except for the sandy bays hidden beyond the headlands, or the long machar of west South Harris, the coast of the Island at high tide rises straight from the undermining breakers, rugged and uncompromising. A series of sandy 'storm-beaches' links the lower promontories, but the series of raised beaches found on the mainland and the inner isles seem absent round the Island. Along the western mainland and the Inner Hebrides, a secret harmony links the lines of the sea with those of the land, even on their wildest coasts of gneiss. Above the level plane of the sea, the shores of the mainland rise in rhythmic curves, tier above tier, some 10, 25, 50 and 100 feet, above the present line of waves and the triple band of colour which marks the shore at ebb-tide, formed of golden tangle, grey barnacles and pitch-black rock. These tiers are the 'raised beaches' of a coast which has emerged, by stages, to some 100 feet above the sea.

Lacking the raised beaches of an emerged coast, the Outer Hebrides show no clean-cut terraces like those of the mainland, inviting little communities to lay out their homesteads in an orderly way. For this reason, the older, unplanned crofts spot the landscape in an irregular way which is sometimes picturesque, yet often almost uncouth. The raised beaches have given the Gaels living east of the Minch a few precious acres of passable ploughland which would otherwise be lacking. In the Outer Isles compensation is found on the smooth machars of shell sand. These machars lie mostly on the stormy Atlantic shore, so that the more cultivable fringes of the Outer Hebrides turn their back to the mainland—except round Stornoway, a reason for their isolation.

In detail, the coasts may be grouped in three types: (1) sloping to the sea, by the sides of sheltered lochs;

366 Hebrides, with a population fluctuating around 5000.[1]
162

2. Aspects and Problems of the Burgh

361 The little town pleases by its views over the harbours,
632 outer or inner—sheltering perhaps a steamer or two and the clustered fishing vessels—across to the wooded sky-line and the beautiful grounds of the Castle, a-flower in spring with rhododendrons. Or framed in trees from the Castle policies, the harbour and even the roofs and
[342] smoke of the houses are not unpleasing (Plate II). But the town's chief charm is its setting, not itself, though its plain dwellings with 'harled' or rough-cast walls and slate
[746] roofs are simple and inoffensive. In rehousing, the Local
[656] Authority had respected Scottish domestic features. But the greater use of local materials, labour and skill is surely desirable in the Island with its many half-employed men, who need such work to maintain income, health and morale.
[362] As is to be expected in view of low incomes, and the extremely primitive housing in the country, urban housing
[162] is inadequate. In Stornoway burgh in 1931, 44 per cent, or nearly half the population, still dwelt in houses of one to three rooms, 17 per cent in four (including attics often with no dormer windows), 20 per cent in five or six, and 18 per cent in seven rooms and over. There has been improvement up to 1939, and after 1945, but much remains to be done.

369 Turning to cultural life, profound differences divide
632 the town from the country about it. Whereas in the townships of rural Lewis the people are almost purely natives

[1] The burghal area was extended in 1935. At the census of 1951 its population stood at 4950. This showed an increase of 15·9 per cent above the population enumerated in the same area in 1931.

369 of the place, even the schoolmaster and ministers being
632 mostly Islanders, in Stornoway an important minority of the officials and business men hail from the mainland, and some of them from the Lowlands. New blood has undoubtedly been needed to promote enterprise, to foresee new possibilities, and even, at times, to make the best of the past. At the same time, the cleavage between town and country is marked in ways of thought and feeling as in
369 livelihood. To take a single criterion, that of speech, most
632 of the children of the town speak no Gaelic and many hardly understand it. While the percentage of Gaelic
197 speakers was 95 in the three outlying parishes in 1931, in the burgh only 70 per cent could still speak the old tongue. By 1951 the ratio, still almost unchanged in the outlying parishes and townships, had considerably lowered in the burgh.

369 The attempt to harmonise the interests of country and
632 town forms a hopeful aspect of the activities both of the Stornoway Trust, which holds the rural and urban property
[656] presented to the people of Stornoway parish by the first
[427] Lord Leverhulme, and of the Lewis Association, formed in 1943 to undertake studies of the Island to guide action
[654] for the future. The maintenance of the town's prosperity
[228] will depend greatly upon its industries of fishing and of spinning; and these are almost inseparable from the
[288] maintenance of the rural population for whom Stornoway acts as regional centre, and who weave with the yarn spun in the mills. Unity in constructive purpose could go far to build up the prosperity of the community.

361 With the recognition of the need for planning aroused
369 by the problems which faced the country with the return of peace, it is proposed, at the centre of the Burgh, to
632 rebuild the whole of the peninsular area of Point Street,

361 by co-operation of three authorities: the Town Council,
369 the Piers and Harbour Commission, and the Stornoway
632 Trust as owner of property, including Lews Castle with its grounds. The social situation is of quite exceptional
[656] interest, and an attempt to describe some of its features is
[654] made in Appendix II, on the Stornoway Trust and the Lewis Association.

(c) CHANGES IN ISLAND POPULATION, AND THE FUTURE

1. From 1801 to 1939

175 Until the middle of the eighteenth century, the growth
162 of population was periodically checked or even set back by famines and epidemics, such as smallpox, or by warfare.
[731] In 1801 the total population of the Outer Hebrides (in round numbers) was 21,700, and in 1831 it was 32,000. Of this total, Lewis carried 9200 and Harris 3000 in 1801 and, a generation later, in 1831, respectively 14,500 and 3900. In the graph (Fig. 12) the curve showing the average for the five landward or rural parishes of the Island (excluding Stornoway Burgh) indicates the fairly steady numerical increase there, almost to the close of the
[731] century. Following the evictions after 1831 and the potato famine of 1846–48, emigration caused a fall in the southern islands (*e.g.* in South Uist, Fig. 12). Forty years later, in 1871, the Outer Hebridean total reached nearly 40,000, of which Lewis alone, with 21,000, now gave more than half the total, and Harris—in spite of an intervening drop owing to evictions—4800. By 1901, in spite of losses in the southern isles, the total for the Outer Hebrides reached a peak of 46,200. Of this, Lewis already contributed almost

175 rent-rolls record something of more vital and enduring
241 concern, the unit of community life in the Lews. This was
427 the 'conjoint' or 'group' farm of the labouring peasantry —though it was overlaid in parts of the Island by the
[476] formation of tacks held by gentleman rent-farmers.

Both rolls are Judicial Rentals, that is to say, the
175 tenants, great and small, were convened by the Govern-
241 ment Commissioners and examined on oath as to the rents
427 they formerly paid; the accounts were then entered and totalled. Because of the Jacobite resistance, the small
656 amounts of rent and the maladministration of the Forfeited Estates, doubt was cast upon the first rental, of 1718. A second rental was therefore compiled in 1726, upon a different system, which confirms the correctness of the first.[1] All were named, including those absent or 'valetudinary'.

175 Owing to the Island's comparatively smooth land sur-
361 face and access to the sea, the people could group themselves as they chose. Whereas in the Highland mainland many
[182] a pocket of land is too small to keep more than two or three
[184] families alive and no fishing grounds are available, in Lewis the people could join together in teams of four, five or six,
[433] to work a hamlet-farm or penny-land, definable as a
[476] joint-farm of unit size, and to man a boat with "four to row and one to steer".

175 The first point of interest is the equality of the shares,
241 each man paying exactly the same as his fellow-tenants for
427 his 'farthing',—a fourth, or other equal share of the farm. An average share of rent was a little over 10 shillings sterling
[436] with additional payments in farm produce, though not (as
[113]

[1] A. Geddes, "Conjoint Tenants", etc., *Econ. Hist. Rev.*, Second Series, vol. i, no. 1, 1948, pp. 54-60. This reconciles the evidence of 1718, reproduced in the Brand Report (1902), Appx. O, and that of 1726, edited by J. R. N. Macphail (1916).

on the mainland, both Lowland and Highland, an outlying reclaimable patch of arable, lying near distant, little-used pasture, frequently gave a single family the chance of a living. Such a site meant solitary toil for the man and his family; but there might be advantages such as an occasional deer from the forest, or a post as hunting 'forester' such as was held by many a Gaelic hunter-bard. In the Eastern Highlands such a high-lying croft was known as *Ruigh* (anglicised to Ry-). Traditions of poverty with individuality in isolation were handed down, for example, from one of my forebears who held such a *ruigh*, Rycorrach, one of several strung out along the 1250-feet contour in a small, high valley off Strath Spey; the last of them was abandoned only recently. Such a *ruigh* may have originally been a summer shieling, only occupied when shortage of corn-land below, coupled with new possibilities of a little profit from sheep-shearing, led to settlement there.

At the fringe of the Island's deer 'forests' of North Harris and Park, stalkers are still found in lonely lodges and dwellings, individuals often of character and worth, as they need to be; and a few isolated shepherds, such as one finds on mainland sheep farms, dwell on small islets. But in the Isles, isolated, high-lying spots for single crofts are rare. And the clearest distinction must be drawn between the true solitude of a single, isolated cottage or croft and the sociability of a group of four or five, or even two or three, crofts, such as those of lobster fishers; for even a few families form the germ of a community, in work and in leisure.

The potentialities of co-operative practice were overlooked by agricultural reformers, excusably enough. For when new methods were required, run-rig kept back the pace to that of the slowest, virtually arresting reform. Soon

fragments of spars and other needful things lacking on croft and moor were picked up and carefully allotted. So, after 1919, from the wreckage of modern industry borne on the ground-swell of 'Depressions', there came to the Islesfolk the frail raft of unemployment relief, doled out like driftwood long ago.

Some assessment is therefore required. The total amounts of relief disbursed before 1931 were comparatively bountiful; and they certainly exceeded the sum of the crofters' contributions to the Unemployment Insurance Fund. After a couple of months of wage labour at road-mending, harbour-repair, or the like, young men were qualified for 'the dole'. Furnished with this, they returned to the croft when paid employment gave out, to cart in their peat, collect stones for a new house or saunter out with a rod for a little fishing from the rocks. All this was done 'on the dole', with complete legality, so long as their names were duly inscribed at Stornoway Labour Exchange as seeking fresh employment. Not a few prayed that 'employment' would not come inconveniently soon, as they would then be legally bound to accept it and to leave the croft. No doubt, even if only a part of the money received was urgently needed, the surplus was not squandered, as it might have been in a town. Extra cash, if any, served to buy a loom here, fencing for the garden there, and other things of permanent use. Yet morally it constituted misappropriation of relief. As a result, through no real fault of their own, young men began to lose independence and self-respect. This general problem for youth was widespread in years of 'depression', and it was peculiarly severe both in industrial Clydeside and the fishing villages of Scotland, and also throughout the 'depressed areas' of northern and western Britain, of which the Isles form the outermost fringe.

APPENDIX III

(A) THE STORNOWAY TRUST: A COMMUNAL OPPORTUNITY

THE people of Stornoway town and rural parish are in a position to control their own future to a degree unusual in Britain since the general loss of common lands in the eighteenth century. Three or four bodies or groups are important in local governance, and in addition to these an effort to arouse citizenship has taken shape in the Lewis Association. As elsewhere, the Town Council acts for the burgh and, it should be added, the Grazing Committees for the townships, the District Council and County Council acting for wider spheres. The Harbour Trust has its special charge. In addition, the fact of corporate ownership is important, as vested in the Stornoway Trust. Besides property in the burgh and its suburbs, including the Castle and its park or policies, the Trust owns virtually the whole landward area of the parish, from Arnish Moor north to Tolsta. It should not be forgotten that the resources of the sea are public property and that the inshore fishings, owing to a considerable measure of protection, are virtually in the possession of the coastal communities. Freshwater fishing is also in the hands of the Trust. Thus, not only building property but essential sources of production on land and sea are in communal possession. The Trust was formed in 1924.

During the first five years of its existence the Trust was burdened with a growing deficit, but since 1929 it accumulated a credit balance, due partly to agricultural derating and partly to the registration of the Trust as a charity and the resulting relief from income tax. Possession without prevision can do little, however; and hence the need for the citizens of town and country to regroup themselves as thinkers for the common

good. In response to this realisation, and encouraged too by the growth and prosperity of the tweed industry, the Lewis Association sprang into being in 1942–43. The Association's aims are survey, planning and the initiation of action for the public welfare, economic, social and spiritual. Something should be said of each of these bodies in turn.

The membership of the Town Council, Harbour Trust and Stornoway Trust overlap, the Town being represented on both Trusts. Indeed by the conditions of the Deed of Trust drawn up by Leverhulme (in 1923–24), the Stornoway Trust must include the Provost of the Burgh as its Chairman, together with Magistrates and Councillors. For some time past the Provosts and Councillors have been chosen from the more important business men of the town. Indeed as a result of the constitution of the Stornoway Trust, urban interests and outlooks might easily gain undue preponderance at the expense of rural needs. Nevertheless two members with strong rural ties were elected to the Trust in recent years.

In view of the growing burden of deficit, the Trust felt unable to frame a general policy, still less to carry it into action. To meet the deficit, the Trust sold portions of properties without reference to any general plan of town or country. Even after the Trust began to accumulate a favourable balance, hand-to-mouth decisions continued to be made, undirected by any clear policy. The most lamentable case occurred when a garage site was given to the chief Stornoway bus proprietor at a road junction near the western entrance to the town, close to the principal new housing schemes and opposite the main gate of Lews Castle and the Lady Lever Park. The palpable mistake in siting soon caused strong public criticism. The Trust repented, and sought to distrain the garage proprietor from extended use of the area. The parties went to law and the case was fought through the courts until, in a final decision reached in the House of Lords, the Trust lost and had to pay a bill of some £4000. The lesson of defeat in the court was severe, capped as it was by the equivalent of a fine of £4 or £5 from every family in the burgh. Coming at a time when the need

Lewis and Harris

361 178 311 491 [654] The chief advantage of moving uphill to the road has been ease of communication and access to grocers' vans and mill-spinners' lorries; but the disadvantage proves to be the laying on of running water. A much-needed scheme for water supply is now being applied by the Department of Health for Scotland. Scrutiny of a 'quarter-inch' map will indicate the chief facts and tendencies and the conditions they involve.

4. *Distribution of Population*

162 311 The distribution of rural population can be closely estimated by inspection of a 'quarter-inch' map, where both the area of cultivation and the house dots are noted. Comparison with parish populations shows that on an average one dot represents seven or eight houses or families and thirty to thirty-five persons. Since there are now no large farms, cultivation indicates crofting, and, therefore, a typical density of one person to a little over half an acre, or 1000–1200 per square mile. Rural numbers over the whole Island show a density of about twenty-five persons per square mile. If the fishing grounds, with a sail here and there on the wide sea, were added, the density would be lower still! A single dot found with cultivation indicates crofts, which are hardly ever found singly. Where no cultivation is shown around a single dot, this generally indicates an isolated stalker's house, a shooting lodge by a road, or a shieling (*àirigh*) out on the moor.

(B) STORNOWAY

1. *Site, Plan and Development*

361 The plan of Stornoway and its harbour shows three stages in the growth of the town, the first two picked out

[TEXT CONTINUED ON PAGE 89]

lan of Stornoway and its Development (*key opposite*).

/p. 88/

361 in solid black, and the third in hatching (Fig. 11). First, upon the little peninsula or 'Point' which protects the inner fishing harbour of the river there grew the nucleus of the town, with its Castle upon the rocky islet now concealed by the steamer pier. Sheltered from the waves by the peninsula and from enemies by the Castle, MacLeod's galleys and the early fishing fleet must have congregated in the inner harbour. Protection from storm was specially needed until, in the nineteenth century, a quay was built, with space for marketing and handling the herring.

174 361 226 504

Inland from the Castle was the little church of the burgh, dedicated to Saint Lennan (L). The little town can be imagined stretching inland from the church, its dwellings built along the 'Point Street' axis, until it met the track, road or street crossing the neck of the Point. The largest church of Lewis proper, now in ruins, stood apart from the burgh, at the south-west extremity of Eye Peninsula. Until trade developed, the backs of the houses would have been turned to the shore. To north, on the landward side from which cattle would come, the market developed.

174 361 [346]

Secondly, in the seventeenth century, thatched houses were strung out along Point Street and the shore for the Gaelic settlers, the fisher- and craftsman-crofters brought here to found a burgh and commercialise fishing. During

342 adequate air-space, and windows opening at the top and
746 usually kept open by day, in which a woman can work at
178 ease. The Department of Agriculture aided the building
656 of a good standard type. The quality of joinery and
335] masonry or concrete work improved, one fairly skilled
333] workman usually directing the householder and friends as amateur builders. The cost of materials was met by a grant, generally of £250, half being repayable by an annual rent of £6 : 10s. for twenty years. Repayments proceeded satisfactorily. No scheme organised by the Department of Agriculture for Scotland won so general a commendation as this of house improvement. It made good use of family initiative and responsibility, with neighbourly co-operation not called for upon a large scale, a township at a time, but in quite a small, personal way. Nevertheless, had more guidance been provided to the builders, the
64] houses could have been really well built. For lack of this, perhaps, crofters increasingly prefer to pay for skilled work, though helping actively. Appendces I (ii) and II (ii) gives pre-War and post-War statistics.

3. *The Township and its Changing Plan*

361 Where absence of rock and boulder permits ploughing,
82] the village land is laid out in a series of parallel strips,
491] aligned with the slope. The road runs either parallel with shore or river, or at right angles to it. The intermixed possession of strips by 'run-rig' characterised the Lowlands before the Enclosures, and is frequent in
123] the Highlands and Isles. The apparent regularisation of field lines may conceal the fact that an individual holder's plots may be scattered amongst those of others in fixed
82] run-rig. This is an advantage where quality of land is so patchy, and each man thus gets his share of good and bad

3: Geddes K-4, 5 (1919-1952) 1955 ES10 Highland Scots
Lewis and Harris

361 luck in land, but a disadvantage where control of a single
[423] area is desired by one man. Regularisation of roads,
[182] houses and holdings is relatively modern, for crofts and dwellings were once grouped in hamlets usually close to
[172] the seashore. The early hamlets can still be made out from their ruins among the rocks, sometimes sketched in the 'six inch to mile' Ordnance Survey plans. They were without formal order or arrangement, each homestead within its boundary wall. Where ploughing was and is too difficult, the soil is heaped up in ridges, 'lazy-beds', and dug.

361 Shawbost, on a rocky part of the west coast (six miles
491 south of Barvas) consists of three main sections: a scatter of houses and ruins by the enclosed loch, two main streets linking the loch to the main coastal road, and inland another short street. The three can be made out on a 'quarter-
[175] inch' map. The two main streets were laid out by the
[311] Estate Officers following removals in the mid-nineteenth century from another part of the island, Uig, and the third running inland was laid out still later, when population was growing and land was needed. When the third street was laid out, the landlord, Matheson, lent good plough-horses for preliminary reclamation. The irregularly placed black houses near the sea are tending to be rebuilt close to the main road.

361 In addition to this type of movement, farms 'broken
178 up' once more into crofts have been laid out on a regular grid plan, each house placed on a corner of its five, ten,
311 or twenty-acre plot (*e.g.* Galson, Dalebeg, etc.). 'Skinned'
[654] land may also be reclaimed for crofts by squatters tolerated by the community, or on a regular grid by agreement of the assembled crofters, guided by the Department of Agri-
[491] culture. Thus two distinct tendencies are seen: the grid plan in new settlements, road alinement in existing ones.

3: Geddes K-4,5 (1919-1952) 1955 ES10 Highland Scots
Lewis and Harris

175 the eighteenth century these 'black houses' would be
342 replaced by houses of stone and lime, and a few of those
• 361 survive.

Of the fort built by Cromwell on the Point, no signs
172 remain. For tactical reasons, the best site would seem
174 to be the neck of the Point, from which the guns of the
712 fort could defend the houses, stores and quays. The irregular building line near the point marked T, a Town House at a later period, may correspond to the
175 northern angle of the fort. The fort appears to have been
712 standing when the original drawing was made for the engraving in the Old (or First) Statistical Account of Stornoway, *c.* 1793.

175 By the time Wood drew his plan in 1820, houses on
361 the Point no longer looked exclusively on to the axial street. The main alinement of interest came to be the shore, marked by a properly built quay. Today, the Point Street houses have fallen into decay but many older houses still stand in fair repair along the 'Beach' or Quay.

175 Thirdly, from the nineteenth century, until 1914, two-
361 storey, flatted tenements, hotels and houses of middle-class
34 people were built upon a grid that followed upon the old field plans. In an alternative plan, proposed about 1820 but not adopted, a diagonal vista opened out to the Established Church, built in 1794 on rising ground. The modest Seaforth Lodge which had stood across the harbour was replaced in 1850 by Stornoway (or Lews) Castle, its pseudo-Tudor style designed to please the new improving landlord, Sir James Matheson, who had purchased Lewis in 1844. Presented to the people on the break-up of the Leverhulme Estates in 1925, a new technical school has
175 taken it over. A few villas also grew up on outlying roads.
361 Thus, a mere village in 1801, and among the smaller burghs
162
226

175 361 162 226 of Ross and Cromarty, with populations of from 1000 to 2300 in 1841, Stornoway leapt ahead by 1851, growing with the rise of the fishing trade. Including the literally floating population of fishers, its numbers exceeded 4000 in the summer of 1921, though falling below this in 1931 when the census was held in the spring.

175 228 361 Still another stage, a fourth, seemed in sight when, in 1918, the first Lord Leverhulme made his bid to centralise the scattered, failing fishing industry of the Island at Stornoway. A canning factory was started (south of the area shown on the plan), only to be dismantled before its completion, then recommenced and again dismantled at "Leverburgh", South Harris. New housing commenced. When this great venture closed and population stagnated, the grandiose proposal to reopen the diagonal vista on Wood's plan and centre it on some great new building, remained a dream. The failure of Leverhulme's great enterprise and its hopes led to discouragement for some years. Yet it is possible that the vision of change given to the Island may have contributed to a renewed capacity for enterprise, individual and communal.

175 361 [288] Later extension had to await the growth of the Harris tweed industry, and the erection of spinning-mills to provide yarn for the rural hand-weavers. The town has extended beyond the plan in two main directions: to north-east with villas and housing schemes and to ESE. with the great new mills where kippering sheds were numerous from the mid-nineteenth century until after 1919.

361 366 [162] Although Tarbert is a shopping centre for Harris and has its spinning-mill, Stornoway has no rival on the Island. The adequate depth of its harbour, combined with its position and access from sea and land, have given

APPENDIX III

for planning preceded by adequate survey became publicly recognised, this crisis seems to have caused a change to constructive policy on the part of the Trust. It led to the election of a new member of the Trust on a planning platform, and to a general searching of heart and mind in the community.

Meantime the movement for town planning which had spread from the bombed cities to the rest of the country, led to a closer co-ordination of planning aims between the Trust and the Town Council, and there is real hope of progress in collaboration with the County Council as the statutory planning authority.

In brief, the opportunity arose for the Trust to frame a comprehensive policy, one binding together the objects separately listed in the Deed, " to promote the material and social welfare of the community ". The ' material ' provisions of the Deed allow for the promotion of industry—including fishing, of course—of agriculture and afforestation, and of communications by land, sea and air. Medical service is not forgotten. The encouragement of social life and education is foreseen, and bursaries may be provided to enable deserving scholars to proceed to secondary schools and universities.

It is felt by far-sighted citizens that these aims should be properly co-ordinated. Development of resources and social life, they feel, could be combined with education and training deliberately designed to equip young people to return to the Island and use their capacities to serve their own community. Thus among the development schemes which have been mooted are the reclamation of peat, the reclamation of the sandy inlet just north of Stornoway, and local afforestation. All these technical jobs require training, at the levels of engineer and skilled foreman or working hand. Bursaries might take the form of education for such rural tasks. The ' export ' of talent may be necessary when no outlet is possible at home, but in the end it can drain away the community's youth. Hence a policy for the return of talent is required. For fishing, for industry and particularly for the weaving arts, training is required in preparation for possible careers at home. Lastly

241/198 The area under cultivation has contracted in the past twenty years. Before 1939 most crofts had about twice as much land under cultivation and at Valtos some were cultivating small patches outside the township fence. The cultivation of the common machair at Cliff ceased in 1939. The land had been "too long in labour" (potatoes had been planted on the same ground for nearly one hundred years), and the soil had been affected by over-liberal applications of sulphate of ammonia which replaced the traditional soot-impregnated thatc from the black-houses. Moreover the Cliff machair was particularly vulnerable to "blow-outs" after ploughing. Cultivation of the Kneep common arable has all but ceased, and the fifty-two acres of arable machair in the township of Reef have been untouched since the 1930s. It is noticeable that the common machair cultivation and the shieling economy [231] ended about the same time. Smaller numbers of better-quality cattle were needed to mee the daily milk requirements of the croft; a much smaller area of cultivation was therefore needed to provide winter fodder and consequently more land was available on the croft for potato cultivation. Consequently the more distant machair was replaced by cultivation within the croft.

433/178 Contraction and decline of the economy is common to all three townships, but the form and cause of this decline is different for each, and where the township consists of two separate settlement nuclei there is frequently a difference between the two parts:

632/427/361/311 The township of Valtos is in two distinct parts: crofts 1 - 34 are a succession of narr strips about ½ mile in length stretching from the shore to about 200' O.D.. The boundari of the outer crofts (nos. 1 and 34) if projected to a point on Pabay, form an angle of 45°, so that the crofts are narrower at the shore (40 - 70') than at the upper limit (100 - 180'). Of these 34 crofts, 19 are in so-called runrig, eight in pairs and one group of three. (Fig. Cultivation is carried out on numerous intermixed small patches, held permanently; the grazings are interchanged at the year end. Fragmentation imposes a severe limitation on the economic efficiency of the croft. None of the crofts at Valtos is individually fence though some groups of two or three are fenced together. With the contraction of cultivati [241] only the less steep areas are cultivated, to facilitate ploughing.[1] As a result, the bulk of the cultivated plots are to be found at either end of the croft - near the shore and on the hill top against the township fence.

The remaining five crofts of Valtos, and a squatter, are at Cliff in the valley separati the Valtos peninsula from that of Aird. Here the crofts are fenced, more compact and slightly larger (4.3 acres as against 3.8 acres) and they occupy more level terrain than those in Valtos. Two of the crofts are worked in runrig - these being situated on the [24] machair. The houses are set back about a hundred yards from the road, along the weste township fence.

Kneep township is again in two parts: Crofts 16 - 18 together with the Manse and two cottars, are situated across the neck of the Glebe promontory, on the south side of the peninsula. The five legal crofts are today worked as three units, fenced, reasonably compact and with holdings of exceptional size for the area - average 15.1 acres. Crofts [433] 1 - 15 at Kneep on the northern side of the peninsula adjoin those of Valtos. Here is a climax of land fragmentation, which imposes severe limits upon croft efficiency. Twelv of the fifteen crofts are worked; of these only numbers 4 and 5 are compact homogenous crofts; numbers 3 and 6 are compact except that part of the land which lies within their boundaries belongs to croft no. 13. The remaining eight crofts comprise a hundred and eight separate plots of croftland and fifty-two separate plots on the common machair. One croft with 2.8 acres arable the average size of each piece is a mere 0.15 acres! [233] The grazing land on the croft is divided into strips running across the slope, which are interchanged each year, whilst a large part of the common grazing lands are divided into

1. Pre-1939 much of Valtos was cultivated in lazy beds - by spade. Today 9% is cultivated by spade; 43% by horse plough + 48% by tractor.

Figures 6 and 7

THE LOTTING OF BREASCLETE

Figure 6 shows the irregular clusters of old houses and patches of arable land (hatched) within the infield dyke. On the right the first of the new houses, standing in a row each on its own 'lot' (or 'croft'), are shown.

Figure 7, from the contemporary Factor's notebook, shows the new crofts as lotted in 1850. Note that these were not fenced.

growing family could increase the size of his holding. Secondly, in the absence of fences a certain discipline of agricultural management had to be maintained; moreover the proprietor, through the factor, grounds officers and township constables, saw to it that it was. This "good husbandry", albeit at a rather low level, was maintained in the interests of tenants and land-owner alike. After the arable land was lotted permanently to individuals, there was less flixibility and less need for communal management. But the absence of fences between the new lots, or crofts, meant that they were still common land during the winter months. In some cases the proprietors paid the tenants to erect fences round the newly lotted inbye land of the whole township but, even when a ring fence existed, stock was allowed to graze indiscriminately within it from November until April.

It is fortunate that the first Ordnance surveyors were at work in Lewis just as the lotting was coming into effect. The new lots were not divided by fences, therefore they were not marked by the surveyors, but in several townships they arrived in time to plot the clachans and in some - Breasclete, for example (fig. 6) - the first edition six-inch maps show some of the new houses, neatly spaced out on the new lots. The arrangement of the latter is recorded in the Factor's sketch books, of which fig. 7 is an example.

Thus whilst we have little evidence of the appearance of the former rural landscape, we have an excellent record of the birth of the new. The characteristic units of the new lotting were townships divided into long narrow strips, arranged parallel and fan-wise more or less in the direction of steepest slope. Such an arrangement was simple to lay out; it tended to give everyone a fair share of the land of each kind - ill-drained and well-drained, high and low. And, if a road or track passed through the township it was usually possible to give each lot or croft direct access to it without the necessity for side-roads. Consequently the houses, when re-built, were usually put on the crofts. A dispersed pattern of settlement replaced the little huddles of the clachans. The extent to which it was dispersed depended on the width of the lots; the greater the number of tenants to be accommodated in a given area, the narrower were the lots. In extreme cases they might be as little as 20-30 yards in width and then the houses, aligned along the road or access track might form a virtually continuous terrace or street.

CHAPTER THREE

THE CROFTING STRUCTURE

In the parish of Uig about 90% of the families are crofters. That is to say, they owe their presence in Uig to their hereditary tenancy of a small-holding of croft status. To these holdings they have a deep attachment; many of them have been inherited through several generations. Others were obtained more recently during the process of re-settlement of farm land which followed the Napier Commission report and 1886 Act. Many older crofters regard the resettled townships as the fruits of a hard-won victory. Nevertheless, we have seen, very few of the holdings are in fact more than 110 years old. And, whilst some families can certainly trace their ancestors in the district for several centuries, there has always been a good deal of movement between townships. Thus the claim that they occupy holdings which were carved out of the barren moor by the toil and sweat of their ancestors is, in most cases, metaphor rather than strict truth.

20.1-50	29	24	940	10	10

Note: 'New' townships, for this purpose, are those settled since 1900.

961 632 In detail the arrangement of the townships varies. Certain features are common: all inbye land and, consequently, all settlements, are coastal (except Lochganvich). Each has common pasture adjacent to the inbye and many have further areas of common - former shieling grazings - some distance inland (figure 1). This division of the hill grazings is to some extent nominal because fences are often absent or ineffective. Uninhabited islands, on the other hand, require no fences, and are particularly valuable for winter grazing; the smaller of them provide convenient natural paddocks for bulls and tups when out of season. The management of all these common pastures is controlled by the township committees. Unfortunately the most important aspect of stock management - control of numbers and maintenance of a proper balance of sheep and cattle - is almost universally neglected. [471]

233 427 656 The total stock which each croft may put on the common pastures - the 'soum' - is defined in the Regulations. In the case of townships re-settled in the present century a specific soum is placed on each croft but, in most other cases, the old practice persists of stating the soum in terms of rent. Thus the soum of each croft may be defined as 1 cow, 1 two-year-old and 8 sheep per pound sterling rent (this is a very common souming). Such soumings have been in existence since time immemorial; they are mentioned in 1836*. Many of the Uig townships had their soumings stated by the Land Court in 1912; in most cases the soum was given "per pound sterling of rent" (presumably 1912 rent), but in a few "per pound sterling of rent payable in 1886". The rents had been substantially reduced in 1891, thus 1912 and 1886 rents were very different. Any township has a certain limited, stock-carrying capacity; therefore, if the total rental is thus changed without

(Compare Fig. 15)

/facing p. 36/

194 Alluvial soils have developed along the lower reaches of Amnuinn Thoraghair and the Erista river.

There are no trees apart from an occasional stunted rowan or willow - willows for
131 creel making grow still in some old garden enclosures. Hedges, too, are rare so, although
824 individual houses are often carefully sited, there is little cover and the townships as a whole are very exposed to westerly gales. The natural vegetation developed on the machair is of fine closely matted grasses with a good deal of natural clover - very similar to that found on chalk downland. On the peaty moorland the usual moor grasses mosses and heather are dominant, though little encroachment by bracken was noticed.

In Crowlista the strip layout of the crofts dates from a lotting about 1850, (Figure 14)
311 in the new townships, laid out about 1921 (Figure 15) the majority of the crofts are
361 less strip-like and do not run to the shore. Indeed in Ardroil and Timsgarry only five
427 out of twenty-two reach the shore and the rocky headlands with their machair are valuable parts of the common pasture. The six crofts in Carnish run from the shore at the foot of the esker up its flank towards the southwest and almost to its summit. They also have one or two small plots each on the machair.

133 Crofts in Ardroil are in one piece. An old cattle road forms the north west boundary; from this they rise, steeply in places, to undulating moorland just over 200' high. Numbers 5 - 8 Timsgarry are strips across the Erista valley, rising northwards to just over 170'; 2, 3 and 4 are allotted to make use of arable land on the lower slopes of Knock Valabrie. The houses of crofts No. 1 Timsgarry and No. 1 Ardroil are the former farmhouses.

417 In Crowlista most of the crofts remain unfenced but in Carnish, Ardroil and Timsgarry all are fenced and many of the fences were being repaired or replaced in 1959. They are not open for common grazing during the winter. Patches of sown hay are fenced within each croft.

There are six recognised croft-holdings in Carnish; one is sub-let so that there are
346 only five "operative" units; two of those are not worked. One has been resumed by the proprietors and is being quarried as an extension of the main quarry between the township dyke and main road. In Ardroil each of the fourteen crofts is worked as a unit - though two carry no stock; in Timsgarry eight crofts are worked as seven units.

In contrast to the above, the old settlement of Crowlista has twenty-five recognised crofts but, by amalgamation and sub-letting these are worked as fourteen units. The Crowlista crofts are small - fourteen are 4.0 acres or less and of those only one is worked as a unit. Crofts as small as 1.5 acres and with a soum of eight sheep can never have been intended to support a family; they are the result of sub-division in earlier generations; the remains of two piers and a curing house point to the importance of
468 fishing in the past. Twenty-one men were employed in fishing boats about 1914. Sub-letting usually takes place between relatives; of some of the fourteen operative units are quite complicated. One example will suffice (croft numbers are here replaced by letters to prevent publication of personal matters):-

Crofts a, b, c and d are worked as a unit (although they are not adjacent). The tenant of a and b sub-lets c and d for grazing; he also helps with the work on yet a fifth croft. The present b is half of an original croft. West of the road the original croft is held in fixed runrig between b and another croft, not part of this multiple "working" unit; east of the road it has been divided into separate strips. The tenant lives on b.

Figure 15.

ARDROIL CARNISH and TIMSGARRY - lay-out of crofts formed from farms in 1921 Compare fig. 14

/facing p. 37/

361 Many of the original houses are ruined or used as byres. Figure 14 shows that new
491 houses have been built near the sites of the old ones but sometimes nearer the road - all
487 but four houses have easy access to the road. Crowlista is linked to the main road by
493 two miles of rough gravel side-road, and by a footpath and ford via Timsgarry. Vans ca
205 but there is no Post Office, store nor bus service. At present water supplies are poor -
322 two wells only are in use.
494
312

Carnish is served by a short unmetalled road and all houses have good access to this. supply is good; water may be stored on the high part of the crofts and piped into the hous The roads serving Timsgarry too, are unmetalled, but the main road is less than a mile away. This 'main road' from western Uig to Stornoway runs through Ardroil and all
366 except one of the houses not near to it have good drives suitable for lorries. Ardroil ha
205 a store and Timsgarry a Post Office. One butcher's and two grocers' vans call weekly
453 and the travelling bank fortnightly. The thrice-weekly bus service to Stornoway (return
494 fare almost £1) ceased in 1960 because of competition from privately owned vans and car

The cultivated land is in strips usually large enough for horse or tractor work; the
241 smaller potato patches are hand dug. Few horses are kept now, Timsgarry, Ardroil, an
231 Carnish have one each and Crowlista none. Crofters hire these horses or tractors from
460 Brenish or Enaclate. Oats and potatoes are the only crops grown in quantity, small patches of turnips are found and most crofters grow root vegetables. Kale was seen gro ing on one Ardroil croft; this was an experiment and seemed to be very successful. Be and rye are no longer grown. Grass mixtures are sown in order to qualify for cultivatio grants. Oats are undersown, or grass seed may be sown after the oat harvest, and left for hay for several years - some sown twelve years ago was said still to be giving very good hay, but on the whole very little grass is sown in Crowlista. The acreage of natural grass cut for hay varies a good deal with the weather and the time and labour ava able. Crofters find this difficult to estimate as well, as often small irregularly shaped pieces are cut and the figures, therefore, may not be accurate. (Appendix A).

One excellent garden showed that a rich variety of vegetables, fruit and flowers can grown if adequate shelter is provided and the time for cultivation is available, but few crofters have the necessary knowledge or interest.

Lime, dung and artificial manure are widely used, though on some Crowlista crofts
242 the compound fertilisers were in use for the first time in 1959. Shell sand is used on th
194 crofts which have peaty soil. Although it is agreed that seaweed and dung are the ideal
824 fertilisers for potatoes, seaweed is only occasionally used. It is becoming difficult to obtain locally and much heavy work is involved.

231 Each of the thirty-five operative units which carry any stock at all has a cow for dom estic milk supply and manure. If the family is large or many visiting relations stay on croft during the summer the calf has to be sold early; otherwise it will be reared until cattle sales in September or May. Only eight crofters had two cows; fifty years ago fo were commonly kept. Only thirteen of the units had young cattle other than calves. O crofter was rearing a kid for milk.

The bull supplied for these townships and Mangersta is an Aberdeen Angus which is wintered on the Ardroil machair.

233 It was sometimes difficult to obtain factual information about sheep and it is difficu to generalise. Operative units without sheep were those where no suitable labour was available. In a few cases crofters considered that sheep were 'not worth the trouble' - but others were building up their sheep stocks. Individual flocks ranged from ten to tw

233 hundred and thirteen - but most crofters had from forty-five to one hundred and twenty. Wedders are sold at two-three years old when the mutton is said to be at its best.

231 Parts of the common pasture - usually the machair, are set aside for wintering hoggs but the usual practice is to keep as many as possible on the croft. The soum as a whole
[427] is not enforced but shares in the wintering parks are adhered to. For example:- Timsgarry Glebe is leased to Crowlista and one share entitles a crofter to winter twenty-five hoggs on it. In Ardroil one share allows one cow or four yearlings or eight sheep or eight hoggs
[232] on the machair - in practice it is the best hoggs that are sent. The minister at Timsgarry, who is much interested in sheep husbandry, has bred a heavier sheep with longer legs by crossing the Hebridean blackface with Swaledales and these seem to be doing very well; the minister is more attentive to his sheep than are many of the crofters, but some local crofters are showing interest in this crossbreed. The lambing percentage, so dependant upon the winter and spring weather, was about 80% in 1959 and this was regarded as good.*

Enquiries show that some crofts in each township far exceed their souming but because others carry no stock the four townships are understocked according to the total soum, here expressed in cow units. Sheep stocks in Timsgarry approximate to the sheep soum, Crowlista is overstocked by 130%, while the other townships are understocked.
[235] Some of the figures used for sheep stock were approximate or estimated. Nearly all crofts keep some poultry and surplus eggs may be sold to the grocery vans.

The rhythm of work on the croft during the year is shown on Figure 16, overleaf.[1]

241 Part of the hill common west of Crowlista was cultivated until the beginning of the
175 present century, at which time the township was overcrowded with two or three houses on each croft. A similar area west of Carnish was cultivated and old lazy beds, now grazed,
[361] are to be seen on slopes south of the road in Ardroil, in the valleys of Amhuinn Thoraghain and Allt a'Gharaidh and on the Borranish peninsula. The ruined shieling huts for this area, still to be seen around and beyond Loch Suainaval were in use until 1934 - '35. (Figure 5).

464 Ancillary employment is sought by all but nine of the thirty men under sixty-five in these townships and the wives of two of the 'full-time crofters' have regular employment.
228 There is no commerical fishing by local boats though the Bernera lobster boats are seen frequently off Uig Bay. The ruined curing house and piers at Crowlista, and the 'port' shown on the O.S. map near the site of the clachan in Carnish, point to the former importance of fishing.

288 At present the weaving of Harris tweed from yarn supplied by the Stornoway mills is more lucrative. There are two looms (plus one other weaver) in Carnish, two in Ardroil, three in Timsgarry and two (plus one other weaver) in Crowlista. All these looms were in use and two tweeds woven a week bring in a useful income but the supply of weaving is irregular. The future security of these weavers depends on the prosperity of the Harris tweed industry.

464 Mitchels's sand and gravel quarry at Carnish provides employment for from three to
316 ten men. Five men from Ardroil and one from Carnish are employed there at present.
912 The Aird R.A.F. station draws most of its civilian employees from Aird Uig but two
377 Ardroil men work there. One Crowlista man is employed at the hydro-electric scheme
466 site at Gisla and this work will last for another year or two. Employers recognise the particular needs of their crofter employees and 'days off' are allowed for sheep fanks and other necessary work.

* The minister's ewes gave 103%.

1. [For Fig. 16, see page preceding p.38--Analyst]

133 The 1,700 acres of common pasture stretch to the east and west of the crofts, across
231 the peninsula which terminates in Gallan Head, extending to those of Crowlista and Valtos in the south. The whole coast is broken and rocky, the land inland is peaty, and Aird
654 lacks the advantages of the machair land found further west. To the north of the village there is now an R.A.F. radar station on Rudha Caol, built on what was part of the common pasture. It dominates the landscape and makes a considerable difference to the life of the inhabitants.

361 The township, though isolated, is reached by a good road which leaves the main road
491 at the western end of Glen Valtos. Grocery vans call on Wednesday and Friday, a
443 butcher's van on Saturday, and the local people are also allowed to shop at the N.A.A.F.I. within the Camp. The road through the village approximately follows the line of the 100 ft. contour and all the houses are built directly on to the road, with byres, weaving sheds and other buildings behind, whilst in most cases hens are kept on the steeper slopes below
205 the road. Thus the settlement has far more of the appearance of an English village than
342 have most crofting townships, but there is no shop or post office. The majority of the houses are stone with slate roofs and fairly large, though some of them have been built for
354 more than fifty years. All have electric light and their own water supply and several have
312 modern byres.

427 There are ten crofts, as the enlargement of one of the original nine was subsequently
311 split off to make a separate croft. Of these, one tenant is an absentee and another an elderly woman who does no cultivation. In both these cases, grazing is let to others so
498 that there are actually eight operative units. The crofts are fenced in their upper portions, but in most cases the fencing does not extend down to the river and there is free access to the single concrete footbridge which spans the stream.

241 The only crops now grown are oats and potatoes and a few vegetables, with some sown grass; natural grass provides most of the hay crop. Lime and shell sand and artificial fertilisers are used; the two former particularly on the ground near the river where the cultivation is in narrow strips separated by drainage ditches and ploughing is done by horse.
407 Most of the cultivated land is on the gentler slopes behind the houses, where the use of a
[illegible] tractor is possible. Before 1914 most of the land within the original turf dyke was culti-
824 vated; here was grown and ground at the mill for meal for barley bread. Seaweed was
231 extensively used as a fertiliser and most of the families kept eight or nine cows, so that there was a more plentiful supply of manure. Now, six of the families each keep one cow for domestic milk supply (two of the others each keep a goat). The township possesses no bull, but make use of those at Valtos or Ardroil.

233 On the other hand, the sheep soum is generally exceeded; instead of the entitlement of about 200, the total flocks grazed on the township pastures are approximately 500. The lambs are weaned early in August and put on Rudha Caol (Air Force use has not prevented this) and wedders are usually sold at the age of two or three years in Stornoway - many in October to reduce the numbers that must be pastured during the winter.

162 The total resident population of Aird consists of fifteen males and sixteen females. Of these, twelve are over 65, six are aged 45 - 64, 11 are in the 15 - 44 age-group (there are only three married couples) and there are two children under 15. Nevertheless, most of them are complete families; only one person lives alone; no members are reported as
166 periodically working away, no men and only two women are permanently away. Neither has there been much emigration since 1939 - five women only have married out of the parish. The tenants of seven of the crofts are over the age of 65, the only one in the 15 - 44 age-group is a new-comer to the district and does little croft work.

511 It is obvious that crofting no longer affords a livelihood in Aird; the only two families
464 without ancillary occupations are those where all the members are elderly. Of the others
288 with members in the working age-groups, five have one or more members employed in a civilian capacity at the R.A.F. station and there are five regular weavers.

621 Aird used to be a self-contained community; the land was fully cultivated and a certain
178 amount of fishing was carried on in spite of the difficulty of drawing up the boats over the rocky beach. Now it is prosperous, but very much dependent on the R.A.F. station, and if this should ever close down, most of the younger people would have to leave in search of other employment.

CHAPTER SEVEN

VALTOS, KNEEP AND REEF

by

David G. Symes.

131 On the eastern side of the Aird peninsula, facing east to Loch Roag is a secondary
133 peninsula of more moderate, but none-the-less broken relief. This, together with an adjacent area of the main peninsula, the islands of Pabay, Vacsay, Vula Mor and several smaller islands, comprises the territorial limits of the townships of Valtos, Kneep and Reef.

133 This secondary peninsula is accidented in the extreme, with outcrops of bare rock and steeply angled small hills. The relief is greater in the west (summit 450') than in the east (summit 275'). Relatively level land is to be found only on the machairs of Reef and
133 Cliff (the latter only poorly developed) and on the glebe at Uigean. The Reef machair,
134 about 180 acres, consists of a succession landwards of tidal sands, a belt of sand dunes (c. 20' O.D.) and a sandy plain sloping gently inland towards a reed filled lagoon. The machair at Cliff is approximately 40 acres in extent; here there are fixed dunes and, in addition, the sand has been blown inland to at least 100 ft. O.D. Except where the machair sand has drifted upslope to produce a "brown machair" of mixed sand and peat, the thin soils of the Valtos peninsula are predominantly peaty. Although the length of the peninsula faces north the extremes of Atlantic weather are moderated by the protection afforded by the Aird peninsula and the islands of Pabay and Vacsay.

175 In the period before the lotting of crofts the whole peninsula was occupied by some five
424 clachans - Valtos, Cliff, Kneep, Uigean and Reef - some of which shared common pastures.
361 During the early part of the nineteenth century and earlier, apparently, than the 1850 lotting
632 carried out in most of Lewis, crofts were allotted in each of the clachan areas: Valtos and Cliff shared a common pasture and so became one township; similarly Kneep and Uigean were combined.

175 In Kneep it seems that the croft boundaries were not accepted by the crofters. Certain
311 basic divisions between groups of crofts (usually three in number) are discernable today,
427 and within these basic divisions a certain regularity of distribution of strips persists, but

TABLE 8

THE RE-SETTLEMENT OF UIG, ISLE OF LEWIS

(See also Fig. 10).

This table may not be complete for the earlier years; acreages are approximate

Date:	Farm:	Township	New Holdings	Holdings enlarged	Area (Acres)
1878	Linshader	Kirkibost	26(1)	-	c.1,300
1880	Hacklete	Hacklete	20	-	c.1,000
1886 (?)	Linshader	Borroston	-	-	500
1886	Dalsmore	Carloway	-	-	60
1891	Linshader	Lundale	6	-	1,156
1892	Linshader	Kirkibost	-	26	1,000
1893	Linshader	Hacklet & Breaclet	-	32	314
		Valtos	-	30	c.300
1910	Mangersta	Mangersta	13	-	2,250
1912	Dalsmore	Garenin	-	27	c.700
1921	Reef	Reef	15	-	1,254
		Aird & Reef	-	10	206
		Crowlista & Kneep	-	43	105
		Garyshader	-	13	88
1921	Timsgarry	Timsgarry	8	-	4,113 (2)
		Enaclete	-	9	621
		Geshader	-	11	} 603 (3)
		Ungshader	-	4	
1921	Croir	Croir	8	-	522
1921	Garnish & Ardroil	Garnish	6	-	288
		Ardroil	14	-	797
		Garnish & Ardroil common grazing			7.153
1921	Mealasta	Mangersta	-	10	1,866
		Brenish	-	29	4,116
1921	Dalsmore	Garenin	-	27	c.300
1925	Linshader	Linshader	10	-	11,109
1932	Uig Lodge	Ard Bheag	2	-	809
1935	Garynahine	Garynahine	12	-	1,915
			140	245	about 45,000

Notes: (1) Crofters were moved to Kirkibost from Bosta (425 acres), which was given as an enlargement to Tobson crofters.
(2) Partly off Timsgarry.
(3) Partly off Garnish and Ardroil.

CHAPTER FOUR

THE ATLANTIC COAST

(Brenish, Islivig, and Mangersta)

by

Pamela M. Gough.

131 Brenish, Islivig and Mangersta are situated in the extreme south-west of Lewis, on the Atlantic coast of the parish of Uig and forty miles from Stornoway.

133 Brenish has a south-westerly aspect whilst Islivick faces north-west; in both the elevation of the crofts decreases seawards from about 125 ft. in the east to 50 - 25 ft. in the west. Only one croft in Islivig, and the eight most southerly crofts in Brenish, run to the sea - the rest obtain some shelter from a line of low hills about 300 yards wide and rising to a little over 100 feet, which forms their western boundary. The land terminates in low cliffs from 25' - 100' in height, and a rocky foreshore. Behind these townships to the east a range of mountains from 1,500' - 1,800' in height and dominated by the highest hill in Lewis, Mealisval, (1,885'), gives protection from easterly influences.

Mangersta lies to the north of these mountains; here the crofts lie in a sheltered 134 valley to the west of which the land rises to over 200 feet. The valley opens southwards to the sea where there is a sandy beach and machair. The crofts range from about 150 feet to 100 feet above sea level; those nearest the sea have soils which contain a substantial proportion of machair sand.

Soils are generally deep, and there are few rocky outcrops on the crofts which are fairly level. In Brenish and Islivig the soils are mainly peaty, becoming wetter in the west. Where visible the sub-soil is gravel or stony boulder clay. In Mangersta the transition from peaty soils on the northern crofts to sandy soils on the southern crofts, is marked by the increasingly continuous cultivation, drains being unneccessary on the latter.

137 There are no trees or shrubs, and vegetation consists of marshy grass moors in the Mealasta area with a considerable amount of cotton grass bog further north. West and south of Mangersta the machair area is characterised by a calceole plant community similar in content to that found in many parts of the chalk and limestone areas of England.

361 Brenish and Islivig are old settlements, never cleared. In both, the sites of the original clachans can still be seen clustered around the mouths of their respective streams. [172] The houses are now situated at the east end of the crofts, near to the road.

175 To the south, Mealasta - cleared in the 1840's to make a sheep farm - was divided in 632 1921 to give enlargements to the common grazings of both Brenish and Mangersta. The 311 arable land was divided into twenty-nine shares as enlargements to Brenish crofts, and is held in a modified form of runrig.

Mangersta was cleared in 1837 to make a farm; subsequently fishermen-cottars settled on the farm but they moved to Dun Carloway in 1873. In 1910, however, a new township of thirteen crofts was set up by the Congested Districts Board; the new settlers were cottars, mainly from Brenish.

233 no road and access by foot is difficult. To reach the grazings the crofters travel by boat from Mealasta several times a year and stay in one of the two houses at Aird Bheag which, although vacant, is still in repair. These houses were formerly occupied by estate employees who had crofter status.

511 From the above account, it is evident that in this district as in others, a single croft is not sufficient to support a crofter and his family. On an average, each resident crofter has acquired the equivalent of two crofts, and in addition each crofter supplements the meagre income obtained from his croft by some other occupation, e.g. weaving, labouring, or driving.

CHAPTER FIVE

THE UIG BAY DISTRICT

(Carnish, Ardroil, Timsgarry and Crowlista)

by

Elizabeth Blowers.

134 Uig bay, in which low tide reveals several hundred acres of pure white sand, is surrounded by crofting townships. There are no extensive machair plains but the shell-sand forms a fringe of easily cultivated, lime-rich soils on all sides except Crowlista, and, blown inland by the Atlantic winds, it modifies and improves the texture and acidity of the peaty soil as much as 2,000 yards from the shore. It is not to be wondered at then, that 361 [175] this bay at one time formed one of the most important centres of population in Lewis. Signs of ancient cultivation, and the ruins of old clachans, are widespread, but most of the present settlements are less than forty years old: almost the whole area was cleared to make farms in the early nineteenth century. Only in Crowlista, with its thin, rocky, arable land and almost complete absence of machair, were the small tenants left undisturbed. [121] Consequently the district provides an opportunity to compare "old" and "new" townships, both as to lay-out and operation.

133 Carnish, in the south-west, is dominated by a huge gravel ridge - probably an esker, - over a mile long and sloping steeply to the estuary of Amhuinn Chaslabhat with the rocky 361 headland of Machair Carnish to the north. The arable land and houses of Ardroil are situated to the landward side of the hummocky machair land between the esturies of Amhuinn Chaslabhat and the Forsa river which drains Lochs Suainaval and Stacsavat. To the north of the bay the old settlement of Crowlista is situated on the rocky headland to the west of the Rethall embayment; there is a good deal of level land in the centre of the township but the slope to the estuary in the north is steep and rocky outcrops occur on the headland. Timsgarry, to the east of Rethall, stretches inland between the headlands of Tolanish and Borranish along the valley of the Erista river.

134 There is a mantle of gravelly drift over this area; the Carnish esker has been mentioned and exposures of up to 120' were also seen in gravel pits in Ardroil and Timsgarry. Along the coast blown shell sand rests on this drift and reaches inland for up to half a mile.

Figure 34

Land-use in four typical crofts in Callanish. Notice that each croft is in two pieces, separated by the road.

312 There is no piped water supply and after even a short period of dry weather there is a
60 water shortage. One prosperous crofter (where the crofter does weaving and one member
of the family is periodically away with a Norwegian whaling fleet) bought a large modern
Bendix electric washer only to find that there was not sufficient water to use it except on
35 rare occasions. The croft houses have had electricity since 1954, and even the three
remaining inhabited thatched houses now have electricity.

311 Although there are only 4 full-time crofters, most of the crofts are carefully and well
worked. Only a few crofts are decaying, and there is a tendency for these to be sub-let
to the more agriculturally inclined crofters instead of allowing the land to revert. In
288 addition to the full-time crofters, 31 other men do part-time crofting. Eighteen men
weave and this provides their main income, but this figure fluctuates according to the
prosperity of the Harris Tweed industry; at present the figure is probably higher than
66 average. Although 32 people have emigrated from the township since 1939 (many of them
young people who have married on the mainland), there is still several young people and
62 young families making their homes here. The dominant age-group of permanently resi-
46 dent adults is 15 to 44. Total population is steadily declining, but Callanish has always
been a prosperous area and seems likely to remain among the more prosperous crofting
communities.

BREASCLETE PARK by Margaret Grice and Doreen J. Phillips.

195 Breasclete Park, also known as New Park, Callanish, was settled by people cleared
from Reef in the mid 19th century. Two of the six original crofts have been subdivided,
427 making nine. However, there are only five working units and on one there is no culti-
vation. There is also a few house built in 1958.

361 The crofts, which are fenced, form broad strips perpendicular to the Breasclete-
Callanish road. Cultivation is mainly by tractor, oats, potatoes and some clover being
241 grown. One progressive crofter has successfully experimented with re-seeding one
231 acre of grazing land on his own croft. Croft pasture for the 148 sheep and 6 cattle
is shared with Callanish, and for most purposes the Park can be considered a part of
that township.

162 The total population is 26 of which 4 are permanently away. There are 6 people over
65, and 8 children under 15.

BREASCLETE by Margaret Grice and Doreen J. Phillips.

131 Breasclete is situated on the east side of East Loch Roag on land which rises gently
133 from the seashore to the moorland and is interrupted by rocky outcrops of gneiss in the
northern part. It is separated from the township of Callanish to the south, by a small
westerly flowing stream, at the mouth of which is the site of a mill.

491 The road on which most of the houses are situated, follows a curve through the
361 middle of the crofts, but newer houses and some feus have been built along the main
Callanish-Cartoway road, nearer to the shore. Stornoway is 18 miles away along this
road which is turned throughout. Breasclete could be served by the still unfinished
Pentland Road, were it to be properly surfaced and this would make the journey shorter
149 by 4 miles. Two buses in each direction per day connect the township to Stornoway, but
high fares make visits to the town infrequent.

312 The township hopes to receive the mains water supply within the next few years, but,
at the moment, relies on wells within easy access of most of the houses. Many houses
have piped water from private wells, some of which go dry after two or three days good
weather although the wells on the lower ground never fail.

000 weather although the wells on the lower ground never fail. Maine electricity was installed
354 7 years ago, but on the whole cooking is still done by Calor Gas and peat. The chief
source of fuel for heating purposes is peat, although a little coal may be used.

427 There are 63 registered crofts, including many subdivisions, a small-holding of 15
acres formerly the Mill, and 10 feus, all of which are worked as 54 units. The crofts
361 lie as long narrow strips in a NE - SW direction from the moorland to the sea. All are
at least partly fenced, the fencing being of recent date. Some croftsays are, at the
moment, making use of fencing grants to enclose their land completely.

241 The only crops grown are oats and potatoes, and although a little clover mixture is
sown for hay, many crofters find that the natural grass is sufficient for their needs.
Vegetables are produced in a few gardens, but most people do not have enough time or
interest to bother with them. Flowers rarely flourish owing to the lack of shelter.

311 Far less of the croft is cultivated now than in the past, and the land nearest the shore,
178 part of which was once cultivated on a run-rig system is now unfenced and used entirely
for grazing together with some peat cutting. A piece of the common grazing has been
improved by application of shell sand and chemical fertilizers and reseeded. This
experiment in which almost the whole township took part has proved very successful and
there are plans for further reseeding. Details of crops are given in Appendix C.

167 Although the tractors of which there are two in the township are used wherever possible,
the spade is still used on many small patches, particularly for potatoes. Much hay is
291 cut by mower but scythes are used to a large extent. There is still one horse in the
township but it is scarcely ever used for ploughing except by its owner.

233 The total number of sheep kept in the township is 1,500 i.e. 2½ times the stanting
which here is 2 ewes and 5 sheep per £1 sterling rent. 40 crofters keep sheep but
none have sufficient to make a livelihood from sheep alone. Many lambs are lost on the
231 moor during the summer and more fail to survive the winter. The number of cattle
kept is 84, i.e. only 1½ of that permitted. It is usual for each household to keep 1 cow
and 1 calf which is generally sold after 6 months when a subsidy can be claimed.
Breasclete has no bull, but shares the one from Callanish. Most households keep
sufficient poultry for their needs but no eggs are marketed.

Shielings were still used to some extent up to 1938. Now it is not necessary as
fewer cows are kept than formerly. With the reduction in numbers of stock the common
pasture close to the village are being colonized by heather.

322 The crofters' year begins at the end of March when the ditches are cleaned and the
333 land is prepared. In April the ground is ploughed, fertilized and sown with oats and
334 potatoes. The sheep are clipped and by the 12th of May must be out on the moors as the
crofts are then closed to common grazings. Soon after this peats are cut on the moors
two or three miles from the village. After about 20 days the peats are lifted and carried
to the Pentland Road by tractor where they are stacked to await the lorry which takes
them to the village.

In June, the sheep are gathered into the fank for shearing and the cows are usually
brought to graze on the crofts from the nearby moors. If the croft is not fenced they
must be tethered. At the end of June the clover is cut, while the potatoes must be
cleaned and hoed. In August the lambs are weaned and dipped. Natural grass is cut
for hay and if there is any first year sown grass this may yield a second crop in
September, together with the corn harvest. When the potatoes have been lifted in
October the crofts are opened and the sheep are brought in for the winter. Final dipping
takes place in November.

162 Out of a total resident population of 226, 56 are under 15 years and 57 are over 65
years of age. Of the resident tenants 9 are between 15 and 44 years, 19 are between
44 and 65 years and 26 are over 65 years of age. Twenty on persons are periodically
000 away e.g. students and seasonal workers and 29 are permanently away. Since 1939,

Since 1939,
166 64 people have emigrated whereas only 4 have immigrated. Most of the girls have to
462 leave home when they finish at school as there is no employment locally. Many of them go
into domestic service or nursing in Glasgow. Many of the younger men also spend time
away from home, often in the Merchant Navy. Breasclete is also the temporary home
of the families of lighthousemen on duty in the Flannan Isles.

288 Although the people live and work on the croft, weaving the Harris Tweed provides
the main source of income. This is a rather irregular occupation owing to the uncertain
demand for the tweed, and although the men are nominally self-employed they rely on the
mills to supply them with work. The tweed is woven on treadle looms which, with ancil-
lary equipment such as bobbin winders, are all owned by the crofters.

As 1959 was a good year for the tweed industry, there was an air of prosperity in the
458 township, and with the aid of government housing grants many new bungalows were being
erected. But should there be a slump, the crofts would be unable to support the popu-
lation and most of the bread-winners will have to leave.

TOLSTA CHAOLAIS by Roger H. Thomas.

131 The township of Tolsta Chaolais lies in a shallow glaciated depression occupied by Loch
133 a' Bhaile and Loch Shader. Most of the crofts are situated near the shore of these lochs,
361 for access to them sea the terrain is too rocky and irregular for either settlement or
cultivation, whilst to the south of Loch a' Bhaile the land slopes precipitously from 250 ft.
to the loch shore. As Figure 36 shows settlement takes advantage of the more gentle
drift-covered slopes, generally of small extent.

137 a' Cultivation is very noticeably limited to three areas - along the west shore of Loch
a' Bhaile, along the north-east shore of Loch Shader, and in the valley of the small stream
241 draining from the north into the head of Loch a' Bhaile. Most of the croft land is com-
posed of rock outcrops, rarely exceeding 100 ft. in height, separated by damp depressions
frequently filled by reeds and rushes; bracken was apparent only on three crofts. In
particular, the area between the two lochs is badly in need of draining and is largely
colonized by reeds and very coarse grasses, of no use whatsoever as pasture. One
enterprising person suggested that the township should hire a ditching machine - this
could certainly be put to use with great advantage.

632 The settlement comprises 43 registered crofts, 6 feus, 2 squatters, 1 cottar, and
311 2 holiday bungalows, with the croft holdings aligned north-east/south-west between the
two lochs and the sea, except for now, 28 and 29. The 33 holdings are unofficially
427 amalgamated in various ways and so reduced to 35 operative agricultural units. The
acreage of crofts varies from 2.2 to 20.75 acres - a considerable variation. Fencing
of the crofts - except for 1A, 1B, and 1C, and 1D and 1E which are held 'run-rig' -
was carried out between 1945 and 1950, whilst in 1946 the common pasture of 2,700 acres
was fenced into two parks - an inner and an outer one, the division coinciding with the
Carloway to Breasclete road. An area stretching from crofts 18A to 21 has, however,
been most haphazardly divided. The seaward halves of some five crofts were redivided
amongst seventeen crofts in the southern half of the township to compensate them for
lack of grazing area within their own croft boundaries. This division is said to date
from about 1886.

241 Most of the cultivation is carried out with hired tractor, although two crofts owned
167 small mechanical cultivators. Ploughing by tractor and horse, as opposed to spade
cultivation, depends either on the urgency of the operation, or on the accessibility of the
plot, for any small patches of cultivation on the rougher terrain are dug by spade, as

[TEXT CONTINUED ON PAGE 95]

CHAPTER ELEVEN

THE CARLOWAY DISTRICT

by

Brian Loughbrough

131 The seven crofting townships of Upper Carloway, (including Carloway Park), Borrowston,
133 Garenin, Knock Carloway, Dun Carloway and Kirivick form a compact area of land in the
north of the Parish of Uig bordering the coast and Loch Carloway. Here the Lewisian
142 gneiss has a thin discontinuous covering of glacial drift which is most extensively
developed immediately above the head of Loch Carloway. Three valleys help to deter-
361 mine the layout of the township and settlements (figure 37). The townships to the north-
west of the Carloway river are found on more gentle slopes than those to the south east
133 where the slopes are less uniform and are less uniform and are often broken by short
steep rocky faces. The north western area therefore offers an environment where almost
continuous cultivation is possible whereas in the south east the frequent rock outcrops
have led to fragmented cultivation on minute plots which are inaccessible to the tractor
or other mechanized implements.

134 The soils are heavy and acid even on the skinned land of the boulder clay slopes nor
is there any machair to mitigate the acidity of the peaty areas which descend almost to
the shores. Only in one place is there any trace of the influence of the lime and this is
to be found where the croftu numbered 1 to 3 Garenin border the small bay in the north of
that township. Here the fierce gales have blown some of the finer beach deposits on to
the croft land.

Much of the peat has been cut from the inner common pastures except in the case of
Upper Carloway where active cutting is still taking place in the valley whose flanks are
142 occupied by squatter settlements, to the east of the football pitch. On the common
311 pasture the vegetation varies from peat moss and heather with bracken and rushes and
close turf on the skinned land by the road to Dalemore. On the upper common pasture
heather and bracken have increased since the abandonment of the shielings and the
reduction of the cattle stock; many inhabitants remember that the hills were much
greener aspect. Nor is this a feature confined to the common pastures; on one croft in
Upper Carloway 1.5 acres are completely covered by heather whilst a neighbouring croft
has a good crop of oats on similar land. At the lock in both Knock and Upper Carloway
areas of former arable land have reverted to moss, the old lazy beds being picked out by
lines of reeds.

361 Settlement. The settlement pattern is one of great interest for it shows in a clear way
the effects of the distinct phases in the historical geography of the area. The evidence
of success and failure stands side by side. Before attempting to justify this assertion it
is necessary to give a brief account of the physical evolution and distribution of settle-
ment.

361 The origin of permanent settlement is believed * to have been the permanent occu-
178 pation of shielings used by people from Bernera until the eighteenth century. Until about
1850 arable land was held run-rig and the houses were huddled together in tight little
clusters. When individual crofts were isted, about 1850, the houses were scattered,
each on its croft and generally up to fifty yards from the present road (which was then
no more than a rough track). Sea access was then most important but since the advent
142 of modern road transport new houses have been built nearer to the roads, producing the
311 modern markedly linear plan. The roads extend at different heights across the slopes

* based on information supplied by Mr Macleod of 27 Garenin.

[TEXT CONTINUED ON PAGE 101]

/p. 100/

Figure 39

361 and across the croft boundaries and it is along these that the majority of the houses are to be found so that as the roads followed the easiest course open to them so the settlement has moved to the roads.

427

178

A particularly interesting example of this kind can be drawn from Upper Carloway where a lengthy movement of settlements has taken place; first, from about 150 feet above sea level, where the original black houses were built; there was an uphill movement to the upper of the two roads which cross the township at from 150 to 170 feet above sea level; and, secondly (and more recently), there has been a move to build at from 25 to 30 feet above sea level along the lower road which has become the main sale for the public service. Three main types of building are to be found in this township. The first is the blackhouse of which only one or two now remain. Even there are not the primitive type of blackhouse, for they all have proper chimneys. The second is an ill-defined group which includes buildings erected during the later years of the fishing boom and in the period up to the Second World War. These houses are either one or two storied often with the traditional dormer windows, they form the majority. Finally there is the development of the modern bungalows which are built by the crofters on land made available by the Department of Agriculture. Few have ventured to build away from the main road of the lower road.

342

178

How then does this pattern of settlement illustrate the changes referred to at the beginning of this section? The original houses were abandoned gradually as the temporary period of the fishing enabled the crofters to obtain better houses. There have been no great changes, but in most cases they are still occupied. Some have been extended and improved by their owners whilst others remained without additions almost as they were when first built. That the crofter owns his own house has certainly encouraged replacement in recent times. The generous grants and loans provided by the Department of Agriculture have been utilised to construct the modern bungalows on crofts where the original croft house stands as a byre and where the second house is sometimes inhabited by some relative or person who sublets part of the croft. It is rare to see such successive phases so close together in a landscape reflecting the varying fortunes of economic enterprise and the influence of government subsidies now so much a part of the life of the crofting township.

Roads and public services.

149

Carloway's importance as a centre for West Lewis is accounted for by the fact that at the break in the coastline caused by East Loch Roag the main road southwards from Stornoway turns inland to Breasclete. Near the point where the road from Upper Carloway at Carloway bridge it is joined by a number of local township roads creating a focus for community services (figure 39). Here also the (unfinished "Pentland") Skyline road, projected as a direct link with Stornoway during the fishing boom, reaches Loch Carloway and passes along the shore which is strewn with fishing gear. The substantial pier was the scene of great activity during the period of commercial fishing before the First World War.

362

194

163

The two hundred residents of the immediate Carloway area are served by eight travelling shops as well as by the local stores. Bread, fish, meat, green-groceries, library and bank all come to the end of the croft if not to the crofter's door. Of the vans one is based on Carloway, one on Breasclete and the rest on Stornoway. A mobile film unit visits once each fortnight. The churches and school rightly reflect their importance in the community by the commanding position which they occupy just above the village. Here too is the playground, the annual show attracts people from all over the island, being as much a social as an agricultural gathering. Other services are more dispersed but not far away. They include doctor and district nurse, policeman, post office, and football

[TEXT CONTINUES ON PAGE 103]

1/ [Presumably the author means figure 39--Analyst]

241

Oats are the main fodder crop and although the practice of undersowing is not familiar it is increasing with the incentive of cultivation grants. Potatoes are the other major crop, the main crop being Kerr's Pink and the "earlies" several varieties. Domestic gardens, common to nearly all the crofts, grow cabbages and carrots. Turnips only succeed occasionally and there were many reports of poor yields. Two crofters had grown sugar beet successfully for fodder but did not see much future for it.

Sown grasses are being used increasingly and several areas of varied quality were noticed ranging from an indifferent field of Italian rye grass that had been down for five years to mixtures recommended by the Agricultural Advisor. These mixtures are used in rotations thus:- oats - potatoes - oats - sown grass - sown grass - sown grass. Some surface reseeding has been attempted and has succeeded on the crofts but none has yet been tried upon the common pastures, which is shared with Park Carloway. The chief problem has been that of finding a suitable area readily accessible to all the crofts. With the example of Breasclete and some of the townships in Ness in mind all agree that reseeding would be beneficial.*

Fences are to be found on all the crofts and a clear pattern of their use emerged. With the obvious exception of doing the traditional types of fertiliser have been abandoned. Only one person uses sheep land to improve his land. The crofts were listed in narrow strips which rise steeply from the western shore of Loch Carloway to a head dyke at about 200 feet O. D. The dyke marks the end of the crofts and the beginning of the common grazing in the winter. Beyond this the ground rises until an upper zone with exposures of bare rock is reached. The result is that most of the cultivation takes place below the road which passes through the croft land and along which the settlement is located. All the crofts are fenced below the road, but are only partly fenced above it, presenting a pattern similar to that in Upper Carloway. Because of the steepness of the land in the way that the tractor can gain access to the land is by way of the lower road which passes from the bridge.

Fifty four acres of crofttland are worked in fourteen operative units on which the oats are cultivated by tractor and the potatoes by spade. Though all the crofts have immediate access to the shore seaweed is not used as a manure at the present time; following the common practice in the area artificial fertilisers are used to supplement lime and manure from the byres. None of the crofts are open for common grazing in the winter; this is because of the use of the old farm of Laimshader, granted to the township as an enlargement . The former arable land is now used as additional common pasture. The normal practice is to use the former farm land in conjunction with the croft land in the summer, the cattle being maintained on Laimshader as late in the season as is possible.

163

Borrowston is intensively cultivated, presenting a prosperous picture when viewed from the opposite shore of the loch, but in spite of its apparent prosperity the majority of the population (57 people out of a total of 107) have left the township. Emigration has been the main cause of concern in this part of Uig parish, for though Carloway is in many ways more prosperous than is south Uig and has a larger and more active population working in much more favourable conditions, the population is as aging one that has not the potential for maintaining a level of replacement. In Borrowston eight of the crofters depend on weaving, four are full time crofters and seven of the twelve are over sixty-five. Yet these men are active and maintain large sheep stocks, ten of the twelve exceeding their stocking though only one of them has an excess of cattle.

Figure 40 has been drawn to illustrate the land use on particular crofts in this northwestern area; one is in Borrowston and one is in Upper Carloway. The stock data has also been added to give the complete picture of the agricultural unit. Each croft though prosperous, has an elderly tenant.

361 is attached to the Free Church Manse, is sublet to two fencers and is used entirely for hay. One remarkably well stocked croft has one horse, two cows in milk, one calf and a heifer together with a sheep stock of twenty breeding ewes, twenty lambs and twenty other sheep (this was the first 10% lambing for many years). Labour is provided by one full time crofter with assistance from two others one of whom is a weaver. On another croft an elderly lady was preparing to make an application for a cultivation grant.

427

241

The intensity of cultivation may be attributed to two factors; first the sheltered position of the land, the moderate slope and good drainage and second to the energy and enterprise of the crofters.

BORROWSTON

361

427

Borrowston exhibits many of the characteristics that have been noted in Upper Carloway and which are common on the north west of Loch Carloway. It contains a general increase in fencing in new taking place with the consequent closure of the old strips which were formerly open for common grazing in the winter. The crofts, by far the most striking feature in the figures gathered for the township are those for the sheep stock which, although the total enumerating for all stocks is not quite reached, those for the sheep exceed by 60.3%. This does not worry the crofters one of whom, the sheep enum is exceeded by 60.3%. This does not worry the crofters one of whom, the sheep enum is exceeded by 60.3%. This does not worry the crofters one of whom, spoke of a "natural equating" pointing to the fact that the total enumeration was not exceeded but continued that "if the sheep are overstocked animals die"; this they do all too often and be confirmed that "if the sheep are overstocked animals die"; this they do all too frequently. The assertion seems to be based on the belief that the equivalence of one cow equals three or more ewes. The sheep grazing are not bear this out. That sheep grazing. The evidence of the heavy sheep losses does not bear this out. That sheep grazing. The evidence of the heavy sheep losses does not bear this out. That sheep grazing. The evidence of the heavy sheep losses does

strips running across the slope, which are interchanged each year, whilst a large part of the common grazing lands are divided into interchangeable sections ("quarters") to accommodate each of the groups of crofts. See Figures 22 and 23.

The cultivable croftland at Kneep is relatively flat and the natural drainage is poorly developed; the quality of this land, depends to a very great extent on the upkeep of a dyke running across the croftland from a small marshy loch to the sea. This dyke has not been cleaned for several years, and as a result a large area has been invaded by reeds. Other parts of the croftland have been similarly overrun by 'wild rhubarb'. Such deterioration is almost inevitable when land is so fragmented.

The crofts at Reef are grouped in three separate localities. Crofts 1, 2 and 3, on the edge of the machair have probably never been occupied since the crofts were allotted in 1921 and are now used only for grazing. The main body of the crofts (nos. 1 - 13) face south - they are more compact than those in Valtos and Reef, but they vary in size from 2.9 to 13.25 acres and their boundaries are irregular in shape. Two crofts (14 and 15) are separated from the main parts of Reef: they are both small (2.5 acres) but the size is compensated by their situation on the level terrain of the machair. The old farm house is used as the dwelling for both 14 and 15. Much of the cultivation at Reef, except on the machair crofts, is on lazy beds - but many of these have decayed with the advent of horse and tractor ploughing; 35% of the land is cultivated by spade, and the remainder by horse plough.

The crofting economy is probably at its lowest ebb in Reef. Only eight of the fifteen crofts are occupied and of these five are worked by disabled crofters or crofters over sixty-five. The Reef crofts were settled in 1921 by returning ex-servicemen and today seven are being worked by the original settlers; there is little evidence of a desire among the younger generation to succeed to the crofts.

Until 1956, crofters on Reef used to graze both sheep and young cattle on the Flannan Islands, fifteen miles west of Uig.

Fig. 24 shows the age/sex structure of the population in the three townships. It tells a story familiar to crofting townships: 55% of the resident population are over forty-five years of age; 9% of the total population are permanently away; and since 1939 the population has declined by at least 15% as the result of emigration alone. But perhaps the most significant fact is the very small proportion of women of a child-bearing age and the consequence that only three children are being born each year to replace the older generations.

By their very position, the townships of the Valtos peninsula are isolated. Fifty years ago communication with the rest of Lewis was by boat. The road to Valtos and Kneep was built originally to bring the mails from the pier at Meavaig; the motor road to Reef was completed in 1956. Shopping facilities are provided at Valtos, for the people at Valtos and Kneep, and at Meavaig which serves Reef, Uigean and Cliff. These are supplemented by travelling shops which call once per week, by Indian dealers and by the local 'bus-driver who makes purchases in Stornoway on behalf of customers on the peninsula. The school for the whole area is situated mid-way between Cliff and Valtos and two kirks and the doctor's house lie at the junction of the Valtos and Reef roads.

CHAPTER EIGHT

LITTLE LOCH ROAG DISTRICT

(Meavaig, Caryshader, Ungshader, Geshader, Enaclete and Gisla).

by

Annis Heawood.

Little Loch Roag is a narrow sea loch extending southwards about twelve miles inland from Loch Roag proper. It has been formed by glacial erosion picking out one of the n.n.e. to s.s.w. lines of weakness characteristic of the Lewisian gneiss. Although generally steep-sided, recent glaciation left much ground moraine and this material, best preserved on the less steep slopes, provides arable land for several small townships on or near its western shores. The eastern shore is the more rugged and although a few small townships once existed there is now only the small farm and shooting lodge of Scalisacro. At the head of the loch is an estate cottage for Morsgail Lodge which is a large mansion with extensive fishing and shooting rights, grandly isolated about a mile inland from the main road.

The district here described includes Gisla, near the head of Little Loch Roag, Enaclete, Ungshader, and Geshader, on the western shores of Loch Roag proper. All these are strung out on or close to the main road. Meavaig, like Gisla, is a small farm but also functions as something of a metropolis for south Uig; it has the post-master, whose other functions include registrar and receiver of wrecks it has two churches, a telephone exchange, the district doctor and manse, and a petrol pump. At the time of our visit it was also the base for the 'bus service. Its metropolitan functions arose in the days before the road replaced a ferry boat service from Callanish; here the mails were landed until some date in the 1920s, and here, too, the estate kept coach and horses for transport to Uig lodge, three miles further west.

There is no record of the original settlement of the four crofting townships, nor of Gisla, which was a township (or 'joint farm') of five crofters until about 1850. Some modern houses and bungalows have been built, many with easier access to the road than the old black houses, now often used as byres. Water supply does not seem to present a serious problem because of the extensive moorland gathering grounds to the west, but there are not at present any water-supply schemes. Electricity is, of course, available. Caryshader and Enaclete are on the main Stornoway road being served at present by the 'bus and by vans selling meat, groceries and fish at least once a week. Enaclete has a sub-post-office. Geshader is less fortunate since, although vans call regularly, 'buses must be met at the junction of the unsurfaced track and the main Stornoway road, where the school serving this district also stands. The track has been extended in recent years so that it now reaches all the houses. Ungshader, however, is smaller and although it has had similar delivery arrangements, it is now a dying settlement largely due to its inaccessibility.

The crofts are mostly regular in shape on the landward side and fenced except where the land is very broken as in northern Enaclete. In Caryshader there are fourteen legal crofts which at present are worked as eleven units; one is used only as a holiday home by its owner-occupier and there is one squatter on the common grazing. In Geshader there are eleven crofts, each worked independantly; Ungshader has four crofts but the

CHAPTER NINE

THE ISLAND OF BERNERA AND

ADJACENT DISTRICTS OF THE MAINLAND OF

LEWIS

('Bernera and Bernera Shore')

by

P. Wheeler

Of the three main sections of the parish of Uig, the Bernera district, consisting of Bernera Island (Breaclete, Croir, Hacklete, Kirkibost and Tobson) and the "Shore" (Earshader, Crulivig and Lundale together with the isolated township of Linshader), presents a number of peculiarities due not primarily to physical conditions, but to isolation. Bernera Island, though central to most of Uig and easily accessible over the sheltered waters of Loch Roag, yet remained relatively inaccessible overland until the recent building of the road bridge; even now it is necessary to travel over six miles to get from the bridge to the main Uig road and a further four miles to Garynahine. Consequently the island, even more than the adjacent mainland settlements, has a very close-knit and self-sufficing population. Whether this community retains sufficient vitality to resist the destructive effect of better communications in addition to the general forces eroding rural and especially Highland life, remains to be seen.

The district shares the unpropitious physical characteristics described in the Introduction. Like the other districts it has virtually no valuable mineral resources (1), and the herring and white fish industries have all but disappeared and seem unlikely to resuscitated. Lobster fishing is, however, prosecuted with vigour and enterprise; it provides a good living but only for a small group of families. The rest depend on regular or casual employment to eke out the proceeds of the croft. The kinds of work available, and the problems of permanent or seasonal absence in search of employment are common to the whole parish; thus this account is mainly concerned with the problems of crofting agriculture.

Settlement: history and patterns.

The pattern of settlement in this inhospitable and discouraging environment is partly very old, and partly very recent. At least four brochs are known on Bernera and various standing stones of even earlier date, while continuous settlement has survived from the early Christian era. Traces of old patterns and practices remain, in tangible form as in the graveyard on little Bernera, or in oral tradition. All this contributes towards the very close network of family relationships that binds the island folk and to a lesser extent those of the adjacent mainland.

With the exceptions of Tobson, Bosta and Breaclete, all Bernera Island had been cleared by 1851. Resettlement began in 1878 when twelve families were moved from Bosta to Kirkibost, and continued at Hacklete in 1880, and subsequently elsewhere. Occasionally (as at Kirkibost) old, pre-clearance lotting patterns were re-adopted, but usually settlement was laid out afresh. The townships of Bernera Shore, were also affected: all the small tenants except those of Earshader and Crulivig were cleared, leaving the land under the sheep farms of West Earshader and Linshader. However, the Bernera Island crofters were allowed to continue their customary use of shellings on the mainland, and the transfer in 1880 of these grazings to their present position marked the

(1) A small deposit of diatomite has been exploited in Kirkibost since 1959. Only a few men are employed and the number is not likely to increase.

Figure 28

Contrasting lay-out of crofts in an older township (Hacklete) and one re-settled by the Department of Agriculture (Croir). Note the relationship between croft boundaries and the better (i.e. potential arable) land.

/p. 60/

175 beginning of the resettlement movement which has given the modern crofters of the
361 district almost all the lands formerly occupied by small tenants. This process was
completed in the Bernera region soon after 1918, and the problem now - one which is
obviously going to become increasingly important - is not to give the crofters more land,
but to find active crofters for the existing holdings (see Chapter III for more detailed
information on clearance and resettlement).

361 The ground plans of the existing settlements vary considerably, depending mainly on
632 the terrain. Where a township is spread along a fairly straight coast the natural
427 tendency is for the croft boundaries to run at right angles to the coast and for each house
to be set on its own croft. The best examples of this are Hacklete and Kirkibost, where
an early nineteenth century (i.e. pre-clearance) lotting was readopted when the township
was re-settled in 1878. Lundale, Cruliviig and Earshader also follow the
same type of layout as nearly as possible, but Tobson, with the exception of Valasay, is
intermediate between a lotted and an unconsolidated township. Croir also differs: it
was laid out in 1921 but the disposition of the potential arable forbade a coastwise
organization. The site of Breaclete is greatly broken by lochs and a sea inlet, and
consequently an essentially regular layout based along a main Loch Breaclete - Loch
Beg Breaclete axis, appears somewhat complicated. The accompanying diagrams
contrast the control exercised by physical conditions at Croir with the subordination of
physical conditions to a simple lotting plan at Hacklete. (Figure 28).

361 Within the townships, with the exception of Kirkibost, the distribution of settlement
342 seems to have changed little since the original lottings, for in most cases the sites of the
178 old and present dwellings are little further apart than is dictated by constructional
632 problems. It would appear generally that black houses were universal in the nineteenth
century except for the farmhouse at 1 Croir (the oldest 'white' house in Bernera), Thule
House, (18 Tobson), possibly the tackesman's house at 11 Hacklete, the former farmhouse
at 20 Kirkibost and at West Earshader. However, with the establishment of Congested
Districts Board and of Board of Agriculture grants, housing was improved, early examples
being 5 Hacklete and 10 Breaclete. The resettled township generally had improved
accommodation from the start. Improvement has greatly accelerated since 1951. In
most cases at the present time housing is of very high standard, only one blackhouse and
one near blackhouse are still occupied.

312 Water supplies and sanitation are less satisfactory. Most crofts by now have their
private water supply, thought it is hoped that mains schemes may be constructed within
the next few years. Sanitation varies in standard and in places there are still open
564 ditches, but all the newer houses have water closets. It is worth remarking in this con-
nection that tuberculosis is almost eliminated. Electricity has been available since 1952
354 to all crofts and most are connected, though not necessarily in every room. Cooking is
sometimes by electricity but more commonly by Calor gas and a peat-fired range or stove
(open or enclosed). Peat is cheap to those able to gather it themselves. Where, however,
help is needed to carry the cut and dried peats to the nearest road, difficulties may arise.
The cost of hiring labour for peat cutting may be such that it is cheaper to buy coal.

191 Access to Bernera by road is now comparatively easy. Where formerly Loch Roag
194 provided the highway of communication, the road built to Earshader after the Great War,
and the £87,000 bridge to Bernera Island, built in 1953, have caused a revaluation of
sites. Linshader is approached by a tarred branch road and the other Bernera shore
townships lie upon the narrow and twisting main road, though four of the six Lundale
crofts have no connection with it, and two of the Cruliviig crofts, and West Earshader, are
somewhat isolated. On Bernera Island the old cart track from the pier at Barraglom
across to Tobson and Croir has been somewhat re-aligned since the construction of the
bridge. This is a good tarred road, as is part of the branch to crofts 3...8 Croir. The
old road to Kirkibost was tarred in 1959, though three outlying crofts near Barraglom
were still without a road suited to vehicles, and the branch within Breaclete remained
untarred. There is a new road to Hacklete from Breaclete which provides tolerable,
though circuitous, communication. Valasay is one of the most isolated settlements in
Bernera, linked with Breaclete rather than with Tobson by the footbridge and causeway
paid for by Congested Districts Board grant about 1903.

CHAPTER TEN

EAST LOCH ROAG DISTRICT

(Garynahine, Callanish, Breasclete, and Tolsta Chaolis)

GARYNAHINE by Anne Iredale and Jennifer Oxenbury.

131 Garynahine is a townships of twelve crofts which are situated on the eastern arm of
632 Loch Ceann Thulabhig. The crofts nowhere extend more than one-third of a mile from
the coast. There is a hinterland of about 1,800 acres of common grazing, which is
133 mostly about 100 ft above sea-level, though it rises to 200 ft in a few isolated areas; the
crofts are lower, and maximum elevation is 80 ft.

134 Most of the croft land is drained by the stream Allt Mhurchaidh which flows through
all but two of the crofts. But the soils are heavy, and several crofters cut peat on their
crofts. Many crofters complained that their land was too peaty for cultivation.

361 The crofts form a regular pattern beside the south side of the main road from
Stornoway to Breasclete, with two small feus and a 21 acre freeholding on the north side
of the road. In addition there is a farm (Garynahine Lodge) of 400 acres east of the
crofts, and likewise stretching along the south side of the Stornoway road. The main
road to Uig passes through the farm, dividing the cultivated area in the west from the
grazing section.

175 The regular lay-out of the crofts dates from the formation of the township in 1935.
361 On the same site, but long cleared, there had been an older village about the same size
i.e. twelve crofts, known to be in existence in the 1850's. The crofts were in a similar
position, but were a different shape, and the ruins of some of the croft houses still remain.
This village was completely burnt out one gusty winter evening when, it is said, a spark
from a crofter's pipe was blown onto one of the thatched roofs, and the wind quickly spread
the blaze to consume the entire village. The crofters left the area, many going to the
neighbouring township of Callanish; Garynahine then became one large farm until 1935
when the land was re-allocated into crofts. The new crofters came from a variety of
areas, several coming from Cruliviig, others from Breasclete and Callanish. The
owners of the farm had also opened an hotel which prospered until 1945 when the farm
was sold to its present owner Admiral Drummond, who has since used the house of a
244 private house. Nine acres of the farm land is cultivated, and the remaining 391 acres
311 are used for grazing. In contrast to the usual practice in this area the oats have been
undersown with rye grass. Another beneficial innovation at the farm is the introduction
of shelter belts. Trees have been successfully planted, making it possible to produce
good crops of soft fruits such as raspberries, strawberries etc. Both the crops and
the stock on the farm are of a high standard, showing that with capital and correct
management the land can be remarkably productive.

In contrast to the large scale economy of the farm, the twelve crofts (ten operative
units) are each between 4.6 and 6.2 acres, and the total reputed arable is 67.3 acres.
In all there are only 9.5 acres under crop (oats 6 acres and potatoes 3.5 acres), and
2.25 acres are under sown grass. The crofts are worked either by spade, horse (hire from
croft 40 Callanish) or by tractor (hire from the Lodge). The seasonal rhythm of culti-
vation and of stock rearing is that in Callanish.

Enquiries soon reveal that crofting is not the main occupation of the croft tenants.
Another indication of the declining interest in the land is the fencing of the crofts. All
were fenced when they were formed in 1935; since then there has been no refencing.
Now a grant is available to pay 75% of the cost of re-fencing but little has been done.

324 Stock totals (see Appendix C) have declined recently and this trend will probably
continue. There are only four cows and two calves in the township (plus six at the farm).

Figure 33

361 Contrasting patterns of crofts: the main block of Callanish crofts was lotted before
178 1850. The group of crofts known as Breasclete Park was added in April 1850 for
families evicted from Reef in south Uig. These, and many of the original Callanish
crofts were later subdivided. The irregular shaped crofts in the south of Callanish
were added at later dates, probably originating as squatters on the common pasture.
The Garynahine crofts were formed in 1935; they have a large area of common
pasture south of the farm.

/p. 86/

231 There is no bull in Garynahine; the Department of Agriculture bull from Callanish is
borrowed. Most crofters buy their milk either from the Admiral at the Lodge or from
Stornoway whence a dairy delivers daily.

Eight crofters keep sheep; stocks vary between 5 and 30 per holding. Two crofters
233 exceed their soumming (there is no equivalence in Garynahine because there has always
been plenty of pasture). With a total of only 166 sheep and lambs on 1800 acres common
pasture there is no danger of over-grazing.

312 The village has a good piped water supply from Loch Mhurchaidh, and has had elec-
399 tricity since 1954. There are excellent communications: 4 buses a day to Stornoway
and also one bus from Uig and one from Bernera passing through Garynahine. These
444 good communications have probably contributed to the declining interest in crofting.

463 There are only three full-time crofters (two of whom draw war pensions). Of the
remaining 12 adult men permanently resident, 10 have regular or part time work, the
remaining two being in old. Employment is either in Stornoway or at the Lodge. Only
[178] two people do part time weaving. Crofting is rapidly decaying in Garynahine. The
croft land is reverting to rough grazing, and there is no indication of renewed interest
in the land. Instead, life is becoming increasingly orientated towards Stornoway.

CALLANISH by Anne Iredale and Jennifer Oxenbury

192 Callanish must be one of the original settlement sites of the Hebrides, as it boasts
an impressive standing stone circle and two other groups of stones. The stone circle
133 is on a promontory, which projects into East Loch Roag. The promontory rises to about
125 ft, and then the land drops almost to sea-level at the neck (less than half a mile wide)
which joins the promontory to the mainland. The township extends inland for about six
361 miles in a belt roughly two miles wide. This inland area forms the common grazing;
it is rough hummocky moorland with the general height rising gradually inland; the
highest point is 425 ft.

175 The early crofts were situated close to the stone circle overlooking the Loch. The
area was given to crofters who had been cleared from Linshader in the eighteenth century,
427 and it is said that until the Crofter's Act the Callanish crofters had to return to Linshader
to work for one day a year in return for this grant of land. But later the crofts on the
364 more exposed westward (facing side of the promontory were cleared and replaced by the
90 acre Callanish Farm. Some ruins of the croft houses still remain. The crofts then
spread across the low lying neck to the main road from Stornoway to Breasclete, which
now forms the boundary between the crofttland and the common pasture. The crofttland
241 varies in quality, but it is mainly quite good potential arable. Fertiliser and manure
are extensively used. Seaweed was widely used in the past but in more recent years the
labour of gathering the seaweed has been out-balanced by the lower price of the artificial
fertiliser. The main problem of the crofters is one of drainage, and in some parts the
drainage channels have to be as wide as the strips of cultivation. Croft 29, situated on
a small peninsula from the neck of low lying land, is almost cut off from the mainland
at high tide.

175 The croft houses were then in two nuclei; one on each side of the narrow neck. Much
361 later a third nuclei developed, known as Callanish New Park, further north along the
427 Stornoway road, formed by evicted crofters from Bernera; they had put to sea in small
boats with their belongings, and they happened to land at this point. They first became
squatters on the common grazing but later gained crofter status.

427 There are 47 crofts in Callanish which vary in size from 2 acres to 9.7 acres. Some
of the larger crofts are a result of private enterprise; the crofters have, without any

[TEXT CONTINUED ON PAGE 89]

THE PATTERN OF CROFTING

427 Crofting, a distinctive system of land tenure, is confined to Argyllshire, Inverness-shire,
241 Ross and Cromarty, Sutherland, Caithness, Orkney and Shetland, the seven Crofting Counties of
178 Scotland. Small agricultural units sharing rights in common land, usually pasture but in some
423 districts arable land also, survive in 151 out of the 163 parishes, and these holdings form the
477 nearest equivalent to peasant communities in Britain, although only a small minority of crofters own their holdings, and the true subsistence element, implicit in any definition of peasantry, has all but disappeared.

175 Before 1886, the crofter was a tenant-at-will, with no security of tenure, and no right to
427 compensation for improvements. The Crofter's Act of 1886, defined a croft as an agricultural
241 holding in a parish where there existed, or had existed, rights of common grazing, and where the
423 annual rent paid was less than £30. Security of tenure, and compensation for improvements were the main provisions of the 1886 Act; the rent qualification was later raised to £50. In all, there are about 20,000 crofts in Scotland today[1] and Collier[2] estimated the crofting population at
[161] about 100,000. The number of crofts in Park is 215, with population of 908. Thus Park forms
[162] a 1 per cent sample of the crofts, and a 0.9 per cent sample of the estimated crofting population.

Crofting Organisation, Layout, and Settlement.

423 The characteristic settlement unit is the crofting township: Figure 3 illustrates the areal
427 distribution of the 12 townships in Park. Each township comprises two main elements, the
361 individually held croft land, and the common grazings. The number of crofts per township
311 ranges from 6 in Caversta to 43 in Gravir.

632 The individually held croft land (1,839 acres) is partly 'outrun' or permanent pasture and the
233 holdings are usually but not always consolidated - in Gravir (Fig. 4) and Cromore some of the crofts comprise as many as five non-adjacent pieces of land. Each croft is normally separated from neighbouring units by a drystone dyke or fence but in Park, such demarcation is the exception rather than the rule.

The croft land is separated from the common pasture by the township dyke, a stone or turf wall. The Park common pastures consist of 22,023 acres of moor grazing - generally very poor, ill-drained land with a large percentage of bare rock, areas of peat, and numerous lochs. In Park, only Oronsay common pasture is fenced, the limits of the remainder being faintly marked by crumbled turf dykes. Each croft has a defined right of grazing or 'soum' on the common pasture; the 'soum' is the number of beasts which may be pastured, a term comparable to the obsolescent 'gates' of northern England. In Gravir, the soum is 1 cow and follower or young beast, up to 4 quarters old (i.e. 18 months), and 8 sheep, per £1 rent. There is also a system of stated equivalences (Gaelic 'coilpeachadh') in most townships whereby substitution of cattle for sheep and sheep for cattle is permissible: in Gravir, the exchange rate is one cow for five sheep. Soumings and equivalences vary throughout Park. In former times, when a subsistence economy prevailed, soumings were enforced but nowadays the majority of the crofters do not even know the souming of their croft.

The former shielings belonging to each croft are also shown: the numbers correspond to the crofts numbers. (Redrawn from 1:2500 fieldmap by F.W. Wheeler, M.A.)

/facing p. 6/

427 Although the croftland is individually held, individual control of the crofts only applies for six
241 months of the year. After the harvest, the croft land reverts to common grazing and the whole
223 township stock graze indiscriminately over the crofts. Thus basically the whole area of the
423 township, the individually held crofts and the common pasture, is common land, and it is clear
178 that the agricultural revolution with its system of enclosure has not yet fully refashioned the Croft
233 Area.

175 Before 1900, there was a third element in the crofting landscape, the shieling (Gaelic - 'airigh
233 The sites of the shielings are usually on slopes commanding a view of the surrounding area near a spring or stream and usually two to nine huts belonging to the same township are grouped together on a site; isolated shielings are rather rare. In order to conserve the pasture within the township dyke for wintering and to protect the unfenced crops, the cattle were removed to the hill early in June, and the younger members of the households went out to live in small stone or turf-walled huts to tend the cattle. The milk was either carried back to the township daily or made into butter or cheese at the shieling. The distance of shielings from the crofts varied from one to five miles in Park.

632 The affairs of the townships are managed by the Grazing Committee, elected triennially by the township and presided over by the Clerk of the Committee. The duties of the Committee in the past related mainly to the enforcement of soumings, but are now reduced to the disbursement of subsidies, although responsibility for the maintenance of the township dyke and the care of the township bull (usually lent by the Department of Agriculture but sometimes communally owned) are also the province of the Committee.

[361] The layout of the townships varies with the topography but the majority of the crofts are aligned
[342] in strips from the moor to the sea (figures 4 and 5). Most croft houses are built on the crofts; in
[78] former times, the majority of the houses were sited on the poorest part of the croft as all the cultivable land was required for crops, but nowadays the houses tend to be sited near the road.

162 The official pattern of crofting is thus one of tenants, each living on his or her croft and sharing
361 in the rights and duties of the township. Table I gives an analysis of the tenants of the 215 Park
429 crofts. It will be noted that only one-fifth of the crofts are tenanted by those in the 15-44 age
241 group: a similar proportion are tenanted by those over 65 years of age. Absentee tenants account
[464] for 14 per cent of the total. Women form under 10 per cent of the total, but only one in seven of the women tenants is the sole labour force on the croft. The intrinsic worth of the holdings can be inferred from the fact that two-thirds of the male tenants in the insurable age group take supplementary work, two-fifths of them furth of Lewis. With such a large proportion of the tenants either fully employed in ancillary occupations in Park or elsewhere it is hardly surprising that the theoretical township organization exists mainly in name alone.

427 Each croft, however, is not necessarily an agricultural unit; some are sublet by absentee
241 tenants or by tenants who are too old or too infirm to work their crofts. Of the 215 crofts, one-fifth are wholly or partly sublet. In addition to the legal crofts, there are unofficial holdings which fall into three categories, cottars, squatters and feuars, all legally without grazing rights. A cottar[1] is a person, usually a close relative of the tenant, who builds another house on

1 These are the de facto definitions. Section 34 of the Crofters' Act of 1886 defines a cottar as follows:- "Cottar" means the occupier of a dwelling-house situate in a crofting parish with or without land who pays no rent to the landlord, as also the tenant from year to year of a dwelling house situated in a crofting parish who resides therein, and who pays to the landlord therefor annual rent not exceeding six pounds in money, whether with or without garden ground, but with
[113] arable or pasture land". For fuller treatment, see Scott, J., "The Law of Smallholdings in Scotland," 1933, pages 152-155.

There is no legal definition of a squatter, and the above definition does not include any distinction between houses built on a croft and houses built on the Common Grazings.

[Seaforthhead]

161 Table XVII reinforces the idea that there is a striking dichotomy between the agricultural
162 and fishing townships. The former are characterised by a more stable population trend,
166 significantly fewer of the population in permanent employment furth of Park, and a smaller loss by
167 migration. In the fishing townships, where growth and decline have been equally meteoric,
241 there is a larger proportion of persons in permanent employment furth of Park, and migration
228 losses have been greater. It is also significant that there is a smaller natural increase of
632 0.5 per cent in the agricultural townships. The only township which shows a natural decrease over this period is Calbost, one of the fishing townships.

SEAFORTHHEAD AND SHIELDERNISH

Rachel A. Hirst

131 Seaforthhead and Shieldernish are separated by 4,485 acres of rough grazing, the former lying on the northern shore of Loch Seaforth and the latter on the southern shore of Loch Erisort.

SEAFORTHHEAD

133 Seaforthhead, the most isolated of all the Park townships, consists of three crofts and a
361 gamekeeper's holding. The township boundary is situated between the 50 and 75 foot contours which at their furthest extent are only 150 yards from the shore. Immediately behind the road the land rises very steeply in rough uncultivable moorland covered with many boulders but generally below the road the land slopes gently at about 5-10 degrees, in places being
[247] completely flat. Here, however, the lazy-beds are very boggy and rushes have appeared in the ten years since cultivation ceased.

134 The soils are deep near the shore due to soil creep; higher up they are very thin and peat
137 accumulates to at least 3 feet both below and above the road. There is little cover; bracken is rare, but silverweed and heather, moorland sedges and grasses soon colonise disused lazy-beds.

241 Legally there are three crofts but only one is still cropped, the other two being used solely
[233] for grazing. There is, however, a gamekeeper's holding within the township boundary worked as a croft. The other two crofts are used as ancillary grazings to holdings in Airidhvruach and Balallan and have not been lived on for forty years and ten years respectively.

[244] The chief crops are oats and potatoes, though the gamekeeper had a patch of turnips and the other croft had grown them during the last few years until 'finger and toe' developed.
[407] Patches, about half an acre in extent, are drained with stone drains and ploughed by tractor, after which potatoes are grown to clean the soil, followed by oats for one year and then sown hay for three to four years. This is not strictly adhered to and several lazy-beds appeared to be
[314] in natural hay. There is no peat-cutting on the crofts as peat is secured just outside the township fence on the common pasture. Lambing has been poor for the past two years being
[231] only 50 per cent in 1958; the stock carried is twice the sheep soum. The cattle, Highland and Ayrshire or Shorthorn crosses, are below the soum, but previously nine cows and followers have been kept.

161 There has been a great decrease in population and cultivation since the resettlement in
162 1886. In Seaforthhead and Shieldernish as a whole, there were twelve crofters before the
241
178

[Seaforthhead] [Shieldernish] [Habost]

161 suppression of the original townships opposed to six today. As a result, many lazy-beds, now
162 given over to natural grass, are being gradually encroached on by heather and juncus. Out
241 of the present population of twenty-three, one is permanently away and two have migrated
178 since 1939. There is a more healthy population structure, with a large number of males between 15 and 44, due to a large family having returned home and six children, five of school age.

361 In Seaforthhead and Shieldernish all settlement is below the road and house-sites are on
[349] slight elevations. At Seaforthhead is the reputed hunting lodge of the Seaforth's, 'Seaforth Castle',
[505] now ruined, but still showing signs of abnormal size and arrangement. When first settled,
491 communication was by ferry (1820). Now a cart-track, deeply rutted, to Eisken Lodge gives
[378] access to the Tarbert-Stornoway road two-and-a-half miles away.

SHIELDERNISH

131 Shieldernish, also consisting of three crofts, is better situated on the Park and South Lochs
361 road. The three houses are situated on a well-drained northerly slope, half-way between the
632 road and the shore, but the three crofts are on better land and greater accessibility has led to better management and new ideas.

241 Cultivation in isolated patches reaches up to nearly 100 feet and the lazy-beds have been put
311 together to permit ploughing by horse or tractor. One croft grows neither oats nor potatoes,
[246] preferring to enclose two one-acre parks, re-seed them, cut the hay in June, and wean the
[231] lambs on the aftermath. By next year, this crofter hopes to have enclosed and re-seeded a
[244] further acre and will then use the three in rotation. The other two crofts grow both oats and potatoes and one is also sowing down. The crofts average fourteen acres in size but although gentle slopes are extensive, the major part of the crofts is in permanent pasture. The total
[226] stocking of the Shieldernish crofts is below the souming. Fishing is now only for domestic use
[288] though there is a small jetty on No. 1. Part-time weaving is performed on two of the six crofts.

The future pattern would appear to progress to more grazing and less cultivation. Two out of the six crofts - both at Seaforthhead - are worked from outside the township and this isolated township, being difficult of access and having little cultivable land, is better suited to grazing. Shieldernish appears more suitable for enclosing parks for fattening lambs, as soils are deeper and slopes gentler, making the use of a tractor feasible. More could be got out of the crofts especially with fertilising and re-seeding for hay and pasture and growing
[185] fodder crops for wintering. It is hoped to fence the common securely, and then stock will be renewed - a great necessity. Daily communication with Stornoway also means that Shieldernish is better placed than Seaforthhead for a flourishing settlement. The crofts are certainly of a workable size - provided part-time work, such as weaving, is maintained, along with the grants from the Crofter's Commission.

HABOST

Rachel A Hirst

131 Habost is scattered around a small bay on the south shore of Loch Erisort. Settlement
133 stretches for over a mile encroaching on three small hills separated by wide, well-drained
241 valleys which soon rise to the dominating Craigeal (225 feet). Slopes are varied but tend to
361 flatten out at about 100 feet near the road and on this flat, most of the cultivation takes place.
[134] Nearer the shore, slopes are much steeper and on the hills there are bare rock faces and thin soils.

[Habost]

134 Drift is found near the shore and laps round the three hills nearly up to the road, predominantly heavy clay with small boulders; this is replaced above the road by peaty loam on rock. At one time, here was grown on the heavy drift. There is peat accumulation on the flat land near the road to a depth of about six feet and there are one or two peat banks.
137 Vegetation is poor; there is no bracken or cover and within the crofts, moorland grasses and sedges predominate on rough land, though there are many lazy-beds sown down to clover and cocks foot. On the hills heather predominates.

195 Habost is the oldest township in Park. In 1843 Maclennan came from Shieldernish and
632 took what are now Nos. 9, 10, 11, 12 and 13 and Ailean Tailear came from Taransay, Harris,
621 to No. 7. By 1886 there were thirteen crofts; in 1907 four cottars were recorded, three being there before 1886; in 1957, No. 11 which had been shared between two brothers since 1906, became legally 11A and 11B making fourteen crofts. There are also fourteen operative units although two are worked from Kershader, both as 'hay and grazing' units, and two are worked as one unit within the township, for there are three non-crofting units.

241 Only sixteen lazy-beds are dug by spade, the rest have been drained with stone drains and
407 ploughed by tractor owned by one crofter who loans it out to Habost and Kershader. There are three 'Croftmasters' (hand-tractors) in the township but these are only heavy enough for bringing in peats, hay and similar light work. The progressive Habost community has fenced
233 off part of the common grazing, to keep the weaned lambs off the croft from August till November and so save fodder for winter when the croft land is open to grazing.

[244] Oats and potatoes alternate in the rotation, with a little sown grass for hay, sown in enclose
[246] parks of about one acre. The tendency now is to increase the number of parks, cut the hay in
231 June and build up the lambs on the new grass. Shell-sand is used to fertilise the parks but
[324] elsewhere artificials, such as superphosphates, 'potato manure', potash, nitro-chalk and lime are used in addition to dung and, near the shore, seaweed. Most of the hay is taken from old lazy-beds.

231 The land is heavily overstocked: the soum is equivalent to 79 cow units, and actual stock is
233 144, whilst the figures for sheep are 191 and 618 respectively, including the sheep stocked in
[432] Park Deer Forest by seven of the Habost tenants. Sales of cattle are held at Garyvard in Noven
[281] and May and sheep and lambs are sold in Stornoway. Lambing was poor in 1958, 50-75 per cent being general, but many breeding ewes and other sheep have died.

241 The only cultivation on the common land belongs to the unofficial holdings. Behind Craigeal, however, there are some old lazy-beds, a well and ruins of a but, which has not been used since before 1852. There used to be shielings on the far side of the common on Beinn Bhuidhe and
[311] below Loch na Ciste but these have not been used since 1886. Habost is one of the agricultural
226 townships and fishing is only for domestic use; looms are to be found on only four crofts and
282 trade is slack. One crofter has a lorry for contracting, carrying peats, fertilisers and stock
[193] to market and two have butcher's rounds in Lochs. There are two small stores.

361 Settlement is scattered, always on elevated ground, and in many cases the new house has
[312] been built in close proximity to the old house site. All have piped water either from the well or
[654] from a rain tank, drinking water being carried in the latter case. Grants from the Crofting Commission are enabling new building and improvements to be carried out.

at Carloway Bridge. In addition to the main settlement which is irregularly disposed on either side of the two roads, a group of Swedish timber Council houses has been built in a somewhat forbidding situation on the common pasture adjoining the 'Pentland' road.

The thirty three registered crofts and thirteen feus or allotments (of which only five are non-agricultural) are worked in thirty four units. Three of the tenants of the Swedish houses have crofts, two in Knock Carloway and one in Upper Carloway.

The land use figures show that Knock Carloway has a much greater percentage of permanent grass than has Borrowston on the opposite shore of the loch. These figures reflect not only the less rewarding physical environment on the south shore, but also the lower intensity of cultivation which bears a direct relationship to the type, number and quality of the stock. The township has less than the total number of animals permitted by the souming though the higher figure for sheep than cattle reflects the general trend for the area. No horses are kept but the township has the bull which serves the area - a privately owned beef-shorthorn.

Weaving remains the major occupation but the emphasis is less heavy than in the other townships for the community services centred here employ a number of the inhabitants. It may be that here lies part of the answer to the problems of the community as a whole: but even if employment in services were to be increased it could never be very significant in a district with a total population of only 600.

KIRIVICK

Adjoining Knock Carloway is the small township of Kirivick which has forty one permanent residents. It occupies the least rewarding agricultural environment of the area. Crofts 1 to 13 rise from the shore of Loch Carloway on the broken hill face to the Carloway-Breasclete road, whilst number 14 occupies the head of a small valley which was once part of the common pasture beyond the road.

The houses are set back from the road occasionally sheltering in the lee of the frequent knolls of bare rock which are exposed on the croft land. These rock surfaces together with the irregular deposition of the drift account for the fragmentation of the cultivated strips in small hand-dug lazy beds on the upper parts of the crofts inaccessible to the tractor.

There are fourteen crofts, three feus and one squatter settlement and all but two of these are fenced. Two of the crofts are held in 'fixed runrig' and the small sections in which the land is cultivated are shown in figure 41 which also illustrates the regular distribution of sections between the two. Though it used to be the normal practice the crofts are not now open to common grazing in the winter.

The restricted amount of land available for common grazing ensured the continued use of the shielings until 1939; small patches were cultivated on the common grazing about forty years ago and this fact too is the only recorded instance of a practice that was a community by the size of the working unit and the land available. At the moment there is no proposal for reseeding of any part of the common pasture* because of the difficulty of getting access for tractors. As in the case of Knock Carloway the total souming is not exceeded, but the sheep stock is 25% above the sheep soum.

The population figures emphasise the problem of the whole of this southern area and here is the most extreme case of incipient decline. There are two fulltime crofters, six crofters who weave and five crofters over sixty five. Seventy per cent of the population is over 45 and only two children attend the school neither of whom is likely to take up crofting.

1. [Figure 42--Analyst]

DUN CARLOWAY

Dun Carloway though clearly of a similar type to the other townships south of Loch Carloway has certain features peculiar to itself. The croft land may be divided into two sections; crofts 18 to 23 occupy the deep trench which extends from the Dun Carloway school to Loch Carloway itself. These holdings are larger than the average discussed above and are divided in broad rectangular block. To the west there is a less deeply entrenched zone where the crofts are long and narrow lying up and down slope like those of Borrowston. Short steep and narrow lazy beds characterise the cultivation which follows the pattern set in the other townships, although the areas, as has been noted above, are much larger in some cases; the largest have up to twenty acres. Despite this increased size no croft has more than two acres of oats. The low percentage of land under cultivation is only in part explained by the difficult nature of the ground and the limited use which can be made of the tractor. Few crofters are willing to attempt more cultivation (to provide extra feed for store cattle or some other form of stock enterprise) so long as the income from weaving is satisfactory. The concept of the croft as an ancilliary employment appears to have defeated its own object, for with the population at its present level, and with the income from weaving as it is, very few crofters are prepared to do more than provide milk for the family, (with the annual cow and calf subsidies, and the proceeds of the sale of the annual calf as by-products) and to derive what income Providence rather than goodmanagement may allow from the sheep.

The total area of individually held croftland is 194 acres which is worked in twenty five agricultural units derived from twenty six crofts, nine feus, one 'free gift' holding and one squatter. The cultivation is accomplished by one horse and one tractor, each fo which is owned within the township.

The total souming is exceeded, the main reason for this being the gross overstocking of sheep: 187.4% of the soum. This overstocking cannot fail to have a harmful effect on the common pasture, promoting an increase in the bracken already visible on some of the croftland itself, under-nourishment and disease. The poor quality of the hill pasture is brought home by a comparison with the grazings of North Uist where the most striking feature of the landscape is its greenness after the heavier browns of Western Lewis. Regeneration by surface seeding would certainly be helpful here.

SUMMARY AND CONCLUSIONS

The tables given in appendices C and D form the basis for much of the comment in the preceding pages. They must now be considered in the light of the general tendencies which they illustrate in the changing livestock economy units.

Appendix C (1) elucidates the working of the crofts. The picture is somewhat complicated by the large number of non-crofting holdings in the area, of which 43 carry stock (a quarter of these sublet croftland). The number of feus also tends to mask the process of amalgamation of crofts to form larger working units; a process which has been taking place for some time. There are in this connection one or two cases of the cross working of crofts between individuals in neighbouring townships. The figures for these units have been included with those of the township where the tenant is resident.

Oats are the most important arable crop. The acreages of sown grass for hay and pasture are much lower in comparison. Permanent grass, mostly old arable land, is to be found on 52% of the total area of land occupied as crofts and feus. A large proportion of this is on very thin soil where bare rock is exposed and on wet land, but even so it does show that much more of the land might be under cultivation or improved grass. The decrease in cultivation since the late nineteenth century is probably much less than that for the Valtos area of South Uig where about 70% of the inbye and outrun is under

TABLE 39

C(2)) and the cattle souma appear impossibly high unless large quantities of winter fodder are imported. In the old townships the soums of each croft are still based on minor variants of the traditional "1 cow and follower and 8 sheep per pound rent"; the rents, however, were calculated on the potential value of the croft in days when an inexhaustible supply of labour was available for production of winter fodder by cultivation. This is no longer the case and the old assumption no longer holds.

Township pastures are seldom, if ever, used to best advantage. Because the regulations generally allow unlimited substitution of sheep for cattle, the soumings are not, in theory, exceeded by the presence of the increased flocks of sheep. In practice, however, the situation is quite different. In the first place the difference between the effects of the grazing of sheep and cattle on the hills is not widely appreciated. In discussions some crofters remarked on the change during the present century in the appearance of the nearer hill pastures - "they were green when I was a boy, now they are black", - but this was seldom correlated with the decline in cattle and increase in sheep. There can be no doubt that the increase in the ratio of sheep to cattle has generally led to a deterioration of the grazings. Further, there are almost five hundred separate sheep packs on the parish pastures, most of them with less than 20 ewes; at some fanks the men and dogs seem to outnumber the sheep! Little real sheep-herding is done - nor can it be by men who have other regular employment. Consequently the hills are not grazed evenly: some areas are grossly over-grazed whilst others are neglected. This situation has grown worse with the decline in cattle numbers and consequent abandonment of the shielings, the occupation of which ensured that use was made of the more distant pastures.

Yet another factor inhibiting proper use of township pastures is their situation and shape. Many townships, particularly in South Uig, have detached areas of hill pasture, former shielings. These are often singularly inaccessible now that the custom of staying at shieling huts has ceased. Other township pastures are long narrow strips running inland for up to seven miles. Straying from one township's lands to those of another is therefore common. Individual allocation of the hill pastures is not practicable but a certain amount of fencing and, possibly, the employment of a paid township shepherd (as in the nineteenth century), would help.

If we examine the stocking of individual working units, Table 39, we find that only 30% carry more than their total soum, 35% carry between a half and a full soum and a further 35% carry less than half their soum. The situation does not vary very much as between the four districts, although there appears to be a slight tendency for working units in

Figure 45

Distribution of population in 1891 and 1959

THE ENVIRONMENT

13 The district of Park lies in the parish of Lochs in south-east Lewis, almost cut off from the
101 rest of Lewis and Harris by Loch Erisort to the north and Loch Seaforth to the west. The district may be divided into two regions by Loch Shell and the valley to the west: this subdivision is meaningful physically, historically and from the socio-economic point of view.

13 The northern part of Park is a low, mamillated, ice-scraped plateau at an average altitude of 250 feet and a maximum altitude of about 450 feet, developed on Lewisian gneiss, a resistant acid rock of Pre-Cambrian age. Glacial erosion has scoured the area and expanses of bare rock are everywhere apparent. Coarse drift deposits are scattered throughout the area, but are more continuous along the southern shores of Loch Erisort between Shieldernish and Caverstu, and at the head of Loch Ouirn. The cool, humid oceanic climate has led to the widespread accumulation of peat, and in the interior there are extensive areas of blanket bog. The Minch coast is rugged with cliffs attaining a height of 350 feet at Kebock Head, but there are several sheltered bays and inlets around which the crofting townships cling to the steep slopes. Along the more sheltered shores of Loch Erisort cliff features are almost absent and the physical landscape is less harsh and uninviting.

The mountainous area south of Loch Shell, an eastward continuation of the North Harris hills, attains a height of 1,885 feet. Glacial erosion has had more spectacular effects than in northern Park and corries and glacially modified valleys are numerous. Southern Park is now uninhabited but during the early nineteenth century a small population was scattered round the shores of the peninsula on areas of drift deposits.

There are no climatic statistics for Park, but the Stornoway figures can reasonably be applied to northern Park. The mean annual temperature for Stornoway is 47°F. ranging from 41°F in January and February to 56°F. in July. The mean annual rainfall in Stornoway is 50 inches, with May and June the driest months, but on average there are 260 rainy days. Wind, however, is the most notable element in the climate: an average of 155 days have gusts exceeding 38 m. p. h.

Soils are thin and immature, except on isolated patches of deeper drift: vegetation is dominated by heather (calluna vulgaris) purple moor grass (molinia) and sphagnum, and there are few trees, stunted rowans being almost the only species; trees are confined to islands in lochs and cliffs inaccessible to stock.

361 The aspect of Park is thus one of desolate moorland, and the human communities are without exception distributed round the coasts; the Minch coast townships are situated on sheltered bays or inlets and it is clear that the harvest of the sea was the original attraction rather than the agricultural possibilities on steeply sloping, rocky terrain.

101 Park is the most isolated area of Lewis apart from South-west Uig. A sea-journey of only nine miles separates Lemreway in the south from Stornoway but the overland distance is 36 miles, which takes more than two hours by the daily bus service. Until 1924, there was no through-road beyond Habost although the Congested Districts Board provided a grant for the making of a road between Gravir and Cromore in 1901; in 1913 this road was extended to Garyvard. With the coming of the road, and the decline in the numbers of fishing boats, the people of Park have ceased to travel to Stornoway by sea. In terms of distance, Park is now more isolated than ever before.

101 Isolated, poor agriculturally, and without any industry, Park is a "Region of Difficulty" with
13 a rapidly declining population; basically the environment has little to offer in the twentieth
14 century.

Fig. 2. Clearance and Resettlement in Park
/facing p. 3/

17 or summer pastures for the tenants of Laxay and Rarnish respectively, townships on the north
175 shores of the loch. In 1775, there were four tenants in Kershader, but their place of origin
162 is unknown. In 1805, five tenants are recorded, two of them from Uig; by 1824 there were 10
361 tenants. Thus the growth of population in Lewis during the second half of the eighteenth century
311 may well have been the major reason for the colonisation of one of the least agriculturally
161 attractive districts of the island.

From Figure 1, which shows most of the thirty-four occupied places south of Loch Shell about 1828, it is evident that colonisation had extended south into the mountainous area. The evictions, which commenced in Harris in 1816, may have increased the population already there as early as 1660, for many of these families came from Harris. The numerous shielings in South Park speak of a vigorous community: it is possible that South Park was more densely populated than the northern area up till 1800.

162 During the period 1818 to 1842, when the grazier, Donald Stewart, and his brothers had a lease
175 of South Park, most of these settlements were cleared (Fig 2): in addition, between 1838 and
361 1843, 68 tenants and sub-tenants in Shieldernish, Cleiter, Seaforthhead, Lemreway, Oronsay,
311 Stiomrabagh and Isginn were removed, in all about 436 people.[1] Some 27 families were sent to
161 Crossbost in North Lochs; others went to Tolsta and Tong in Stornoway parish, and some emigrated. The main body of those evicted settled in the townships in North Park: Marivig in 1838 had 6 tenants; by 1850, 22 are recorded. Thus the present distribution of population crystallised about 1840 and by then the townships along the shore of Loch Erisort from Habost to Garyvard were well established. The Minch coast townships from Cromore to Gravir, first settled about 1800, were greatly expanded, and Park south of Gravir became a sheep grazing devoid of small tenantry.

175 In 1844, the Seaforth family, which had held Lewis for over two centuries, sold the island to
423 Sir James Matheson. The estate management soon wrought great changes in the landscape. Until
311 1850-52, the run-rig system prevailed, a system whereby a group of joint tenants, or a tacksman
361 and subtenants, cultivated in small patches what arable land had been reclaimed, each share
241 being periodically re-allocated. The crofts, or individually held land, date from 1850-52, when the land was lotted and most of the present crofts were formed at this period. The settlement pattern associated with run-rig was one of closely nucleated groups of houses but when run-rig was abolished, houses were built on the individual crofts.

175 In 1858, Lemreway was once again made available to crofters, most of whom came from the
162 fishing townships where population pressure was building up. After the disastrous potato famine
433 of 1846-7, and the final failure of the kelp industry from 1840 to 1844, the population of the Outer
731 Isles experienced great hardship. By the early 1850's, the lotting of the crofts and the rapid
228 development of the fishing industry brought a period of prosperity and the population grew rapidly
161 especially in the fishing townships of the Minch coast. The prosperity was such that numerous cottars built houses on the lotted crofts, and their stock-keeping on the common was tolerated because of the demand for fishing crews. About 1884, the system whereby each boat was tied to individual fish merchants, who advanced meal and provisions against the catch, was discontinued. When this system was replaced by the auctioning of catches, such was the privation in Lewis that the Royal Commission investigating the poverty of the population in 1888 found conditions almost as severe as those prevailing during the potato famine forty years earlier. It was during this period that the Park Deer Raid occurred: Park became a Deer Forest in 1883 at the end of the grazier's
[685] lease. In 1888, as a demonstration of their grievances, a large number of crofters from the Park townships went into the Deer Forest and killed about 200 deer, cooking the meat in the open for all to see. Some were arrested but after trial acquitted.[3] A few good fishing seasons remedied this unhappy situation and the population of the fishing townships rose to a peak in 1911.

[113] 1 Evidence given to Royal Commission of Inquiry into Crofters and Cottars 1883. (Also known the Napier Commission).

[113] 2 Report on the Conditions of the Cottar Population in the Lews, 1888.

[113] 3 Stornoway Gazette, 27.1.59.

While the Royal Commission of 1883-6 was investigating Crofting conditions in Scotland, the farm of Seaforthhead and Shieldernish was restored to six crofters. Six years later, the Royal Commission of Enquiry into the Highlands and Islands scheduled the following land as suitable for new crofting townships: Stiemreway, Eilean Calum Cille, Crobeg, and the islands of Orosaidh and Rossaidh, a total area of 153 acres arable and 3,502 acres grazing. A further 165 acres of arable and 40,135 acres of grazing in the Park Deer Forest were scheduled as land suitable for the extension of existing holdings. The Report of the Commission considered "that in the case of Lewis, it cannot be left out of view that the congestion is very great, and the demand by crofters for access to lands now scheduled is of a very urgent nature ..... The Deer Forest Commissioners do not believe that the lands now scheduled are suitable for new holdings: but were these lands occupied as common pasture by crofters, under a properly adjusted system of management, their occupation would be of much advantage to the occupants and more than outweigh the disadvantages."[4] As a result of this recommendation, the islands of Rossaidh, Orosaidh and Iubhairt, in all 90 of the 43,728 acres scheduled, were given to Marivig, Calbost, and Lemreway, respectively, as additions to the common pastures; the sheep farm comprising Crobeg, Oronsay and Stiemreway, and the Deer Forest were left undisturbed.

In 1924, after raiding, Oronsay was reconstituted as a crofting township, all but one of the new tenants coming from the overcrowded crofts of Lemreway. An unsuccessful attempt was made by squatters who had built houses at Stiemreway, to have their unofficial lots recognised, but some families remained there till 1945. In 1934, fifteen small lots were cut out of the Gravir common pasture to relieve pressure on the Gravir crofts: this Department of Agriculture scheme marked the end of a century of population redistribution.

Thus the full recommendations of the Deer Forest Commission have never been implemented, but one can only conclude, after a study of the crofting economy, that greater participation by the crofters in the Deer Forest grazing would bring increased viability to the crofting community.

The landscape of Park has thus experienced four formative periods. Of the prehistoric era and the early historical period, when the Norsemen held sway, a few archaeological sites and a large number of place-names remain. From 1660 until the early nineteenth century settlement was slowly established and spread over all the coastal fringe: this period saw the maximum areal distribution of the small tenantry. From 1828 to 1843, eviction stripped the entire area south of Gravir and west of Habost of population, and large scale sheep farming was extended at the expense of the small tenants. The fishing townships from Cromore to Gravir were greatly expanded at this time. From 1858-1924, three of the cleared townships were reconstituted: the population in the majority of the fishing townships continued to grow till 1911. Since 1924, fifteen new lots have been formed in Park but the population has progressively declined.

The absence of large scale resettlement since 1886 differentiates Park from most other crofting districts, but the exodus of population since 1918 and the existence of a population constantly struggling for viability in an area deficient in resources are features common to the entire crofting area.

/facing p. 5/

a fraction of the total arable land is cultivated by tractor and this is divided among
ofts. In spite of an emphatic statement by one of these cultivators to the effect that he
r use it again, the use of the tractor will increase as soon as the pioneers are able to
their neighbours its capabilities and as soon as the lazy-beds are joined together, an
nent which has already taken place in Habost. The main objection to the use of the
y the disappointed user was the inevitable one that the yields were smaller than in
ears when he had used the spade. The answer to this was given by one of the other
, who thought that time saved could be devoted to some other profitable occupation,
ple, weaving. Six of the crofters practise a five-year crop rotation, sowing potatoes
llowed by oats under-sown with clover which for the following three years is cut for hay.

teresting experiment has been that of the improvement of two acres of common grazing
he road on the west side of the township, by nine of the crofters working together during
ings. The work began early in Spring when 6 tons of lime, 10 cwts. of mineral phos-
nd 8 cwts. of compound fertilizer were spread evenly over the land. The grass seed
n in July, the most favourable time for sowing since there is less danger of a drought
lier in the year, and more convenient too, in that the sheep had been gathered for shearing
of them were available to be driven back and forth over the land to tramp the seeds in.
this land should be ready for grazing next Spring, but in practice it will be ready in
er. It is planned to re-seed twelve acres in all.

crofters have a cow to provide milk for their own needs. The Black Poll bull at Gravir
rred to the other township bulls since its progeny command higher prices. Sales are held
strict twice per year, once on the old lake-level on the east side of the township, and once
an. Prices for calves are normally better in Spring than at the Autumn sale, nevertheless
ffered tend to be low. Even so, it is usually to the advantage of the crofter to part with
al rather than bear the cost of taking it back to the croft and wintering it there. Naturally
some bitterness that the middlemen who buythese animals will sell them at much higher
n the mainland at Dingwall. Sheep are normally sold in Stornoway to the butchers but
he local sales.

ting is not in itself a lucrative form of employment and in most households there is at

332 At the moment Garyvard appears to be a go-ahead village, carrying out communal schem
[62] which will benefit the township as a whole. However, the age structure of the population is
since 60 per cent of the population is over 45 years. The future in Garyvard offers young pe
132 hard work, little money and no entertainment, making the attractions of the cities and indus
of the mainland quite irresistible. Unless some industry can be started the future bodes ill
area, since most crofters are of the opinion that a weekly wage packet would more than com
131 the loss of their independence. Perhaps it is symptomatic of the age of National Assistance
subsidies that man cares more for momentary rewards and the luxuries of life. This is wel
understood by parents who encourage their children to leave the islands to seek employment
in Britain or within the Commonwealth. The Lewisman is no sentimentalist clinging to dyin
and a way of life. His present desires have been re-cast as a result of his increasing contac
the world beyond the Hebrides and he is prepared to abandon his home where it defeats his a
and purpose. Unless prosperity can be brought in by way of industry, tourism or increased
efficiency, possibly through co-operation in working and marketing, it is possible that we a
witnessing the end of a community.

CAVERSTA

Helen Mackensie

131 Caversta lies along a southern inlet of Loch Erisort, five miles from the Minch and is p
sheltered from east winds by the Cromore peninsula and Eilean Chaluim Chille.

133 The physical nature of the terrain is irregular, rising steeply from the water's edge to a
of approximately 225 feet. To the west and to the east, the land slopes to the river estuary
361 is here that the settlement occurs. Particularly in the north-west, two marked breaks in sl
visible at 75 feet and 100 feet above the loch, which is here bordered by a 25 foot rock face.
resulting platforms are separated by faces of bare rock. The valley of the Caversta River i
noteworthy feature. Below a small loch, the river follows an irregular course though a wid
shallow moraine-strewn depression and a quarter-of-a-mile from its estuary, has cut throu

[C-lbost] [Gravir] [Glengr-vir]

The present situation in Calbost is best illustrated by reference to the population statistics. There are only 17 people living there at present, seven of whom are squatters and only eight houses are occupied within the dyke. Of the male population, there are three children under fourteen years, one man in the 15-44 age group, three between 45 and 64 years and two over 65. This clearly shows the lack of active men from 15-44 years, necessary for the continuing economic success of the community. However, even these figures are not so striking as the numbers of emigrants as no less than 39 men and 40 women have left Calbost since 1939.

A community of 120 persons has shrunk to less than 20 in only twenty years as the younger people have left to find employment in Stornoway and on the mainland. The present population structure seems to indicate a continuation of the downward trend.

GRAVIR AND GLENGRAVIR

Gravir, the largest Park township numerically in population and crofts, lies astride the major east-west inlet of Loch Ouirn, a glacially modified line of structural weakness. The site of the township is perhaps the most picturesque in all Park, but the steep slopes, lack of cover, the small area of good arable land, and the considerable population existing on slim resources, problems common to Park as a whole, are all epitomised in Gravir.

On the south-facing slope above the loch and the continuation of the trough in the valley to the west, the majority of the crofts have been carved from moor to sea, some before 1800, and some in the process of the abolition of run-rig which was accomplished in the years 1850 to 1852. Originally, there appears to have been thirty crofts, but four were added during the nineteenth century, two at each end of the line, and in 1934 a further fifteen were cut out of the common grazing, a mile to the west of Gravir. On the south side of the loch, the 'clachan' of Tom an Fhuadain, established about 1800, has since developed into a further nine crofts. Thus there are forty-three legal crofts in Gravir and a further fifteen in Glengravir making fifty-eight in all.

The layout of Glengravir, a line of crofts from 3.6 to five acres, typifies the small post-1918 Department of Agriculture holdings. The arrangement of the Gravir crofts is illustrated in Figure 4, and it will be seen that not all the crofts are consolidated. There are three areas of former arable commons which have been lotted in unfenced strips and they may well be reclamations which were necessary to supplement the food producing capacity of the holdings. The method of division and allocation speaks of a period when a subsistence economy under severe pressure from over-population necessitated fair shares for all. The last of these commons was in cultivation until 1891. Although subsistence crofting has been obsolete since then, there is as yet no move towards a regularisation of the layout.

The congestion which necessitated the reclamation of the arable commons developed mainly as a result of a successful fishing industry which prospered from 1860 to 1914 and at one time there were two curing stations in Gravir. With relative prosperity from an ancillary industry, cottars were tolerated and the population rose from 197 in 1830, to 368 in 1881 reaching a peak of 468 in 1911. The collapse of the industry after 1914 began the downward trend which has certainly not yet ceased. Gravir reverted from 1918 to a township of agriculturalists and a base for employment north of Lewis, although there have been spasms of successful fishing activity since.

Stock raising is now the function of the township and the agricultural resources and conditions are hardly conducive to the development of economic holdings. The Gravir and Glengravir crofts vary between 3.5 and 26.5 acres in size: no croft has more than four acres of 'old arable', in the days of subsistence agriculture, and indeed until the 1930's, cultivation, all in narrow lazy-beds, banked up with stones at the downward extremity on the steep slopes, was much more extensive. All the cultivable land was at one time under crop, heavily manured with seaweed cut as far away as Cromore or the coast south of Kebock Head. About one-third of the maximum lazy-bed area is now cropped and the more inaccessible areas of the crofts have reverted to pasture; some of the lazy-

[Lemreway] [Orinsay]

229 The West Highland Survey Township Card[1] describes Lemreway as "predominantly a fishing
146 township". The remains of an old curing station are visible today and until 1947 there were twelve
434 boats operating from Lemreway. A declining market, increasing cost of gear for obsolescent boats
435 and the lack of a landing stage led to the decline of the industry in this township. Today there is
524 one fishing boat which lands its catch in Stornoway: working with modern equipment, drift and ring
nets, it provides a regular income for a crew of six.

161 An examination of the population statistics proves interesting, especially when compared with
162 those for Orinsay. Lemreway's resident population of just over 70 males and 70 females is large considering that there are six unoccupied crofts. Eleven of the crofts have more than one house and the cottar population forms over a third of the total residents. More than two-thirds of this resident population is in the two important age groups - between 15 and 64. With over forty resident males in the working age group, Lemreway provides a striking contrast to other crofting townships in Park.

463 Fourteen of these men are full-time croft workers, while nine others find work in ancillary
241 occupations such as weaving and fishing. A further eight supplement their croft work with regular
295 employment - a postmaster and a postman, a bus driver, a lorry driver and several weavers. Just
232 over thirty people work away from the township permanently, fourteen in the Merchant Navy and
205 nine girls in domestic service, while a further nine engage in seasonal work.
349
166
167
605
597
242 Emigration from the township has continued steadily with forty people leaving since 1939.
Nevertheless, Lemreway has a larger proportionate resident population than most townships.

Only four thatched houses are occupied and housing conditions generally are good. Every house
242 has electricity, but, with four exceptions, water has to be carried from springs and wells. Most
399 of the present houses were constructed in the 1930's and they are usually near to the road. Ruins
312 of the old houses remain, some being used as byres, and these were built either along the shore or
361 up the slope in the shelter of the hills, where the house was near the sheep, the peat and the springs.
Today supplies of food, peat and even seaweed are brought by road.
197
484

Mention must be made of the possibilities of the tourist trade in Lemreway with its most attractive situation and reasonable road connections. An approach has been made to the Scottish
485 Youth Hostels Association and while hostellers could not greatly increase the income of the residents, they would stimulate interest in the area. Accommodation for summer visitors, other than relatives of the crofters, is difficult to find but it seems that at least three houses could be used.

000 It is possible to be optimistic about the future of Lemreway, as at the moment considerable
407 enterprise is being shown. A Ferguson tractor, bought this year by a man returning from whaling,
is an example. It is to be hired out and could be put to good use in some parts, especially on the
311 estend. The attempt to improve the common pasture and the new extensions to neatly painted houses
242 all reflect a combined effort to improve conditions. The old economy of crofter-fisherman is
463 being adapted to modern times and crofter-weaver, crofter-postman and crofter-bus driver are the contemporary employment combinations.

181 The pessimism and apathy noticed in many crofters is to be found in Lemreway but above this
000 is the impression of enterprise. If Lemreway can continue to adapt itself to changing conditions, it may be able to combat the 'drift to Glasgow' and continue as a successful community.

ORINSAY

Beth Blowers, Brenda Turner and John Wearmouth

181 Orinsay is a small crofting township clustered, in the form of a horseshoe, around the head of
361 a sheltered bay on the northern side of Loch Shell. Most of the houses are situated within fifty yards
241 of the shore on a narrow strip of level land, while the crofts extend from the shore on to the moor

1. The Directors of the Crofting Survey are grateful to Dr. F. Fraser Darling for granting access to the individual Township Cards, which are a storehouse of information. For detailed con-
113 tents of the cards, see West Highland Survey p. 247.

[Orinsay]

361 which rises steeply, exceeding 375 feet in the west and 150 feet to the north and east. From
241 the north-west and north-east two glacially deepened valleys drain southwards, their lower ends
195 being "drowned" by northward extensions of the loch.

134 Although peat covers most of the surface it is only in the hollows that it is significantly deep, for even on the gentler slopes the peat cover is frequently so thin as to expose a layer of morainic sub-soil containing many stones and boulders.

187 Two rowans and a dozen willows represent the only tree growth, but tree stumps frequently exposed in peat-cuttings suggest that woodland was formerly more evident. Whether this former woodland disappeared as a result of human action or of climatic change it is not possible to say, but it is certain that a century of overgrazing has not favoured natural regeneration. Moorland grasses, sedges and a little poor heather characterise much of the area, and reflect the poor grazing capacity of much of the moorland. Bracken has established itself in one limited area on a patch of neglected croft land.

195 Orinsay is unique in Park, for the present township is entirely a twentieth century development.
652 In the early 19th century there was a settlement at the head of the loch, but in 1843 the residents were removed and the area enclosed and added to Crobeg sheep farm. In 1916, there was a proposal to establish fourteen crofts, but the applicants were requested to wait until after the war. At the end of the war the return of many young men with a desire to settle down led to serious overcrowding in Lemreway. Several of them 'raided' the Orinsay area. At first living in huts, they built their own houses, and in 1922 the Department of Agriculture intervened, recognising and fencing off fourteen legal crofts, and at the same time providing a good footpath. Seeing the success of their neighbours, four other Lemreway families, comprising 26 people, went to Steimreway, about a mile to the west of Orinsay. Here, however, the Department of Agriculture did not intervene and with the community remaining isolated, most of the settlers returned to Lemreway within three years, although one family remained until 1939.

241 Six of the crofts have an area of less than ten acres, six have between ten and fifteen acres,
while the remaining two occupy eighteen and twenty-five acres: the largest croft originally belonged to the shepherd on the sheep farm. Three of these crofts are not occupied, although worked by other crofters, with the result that eleven operative units share 161 acres.

241 Only a small part of the croft acreage is actually cultivable: even less is cultivated in practice.
311 The broken and rocky terrain combined with the peaty soil allows nothing but the cultivation by spade of tiny lazy-beds. The total area now cultivated does not exceed 25 acres, although in the past it may have been nearer 40 acres.

241 Oats and potatoes are the staple crops, occupying 9 and 6½ acres respectively in 1958. Individual
246 croft acreages of these crops vary in relation to the requirements for winter stock-feed, and in the
246 case of potatoes, to domestic consumption. Nevertheless to produce even these meagre returns the soil requires careful preparation. A plentiful supply of seaweed is obtained from the shore and is the most frequently used fertiliser, while a little sulphate of ammonia is applied. Only two crofters use lime.

251 In the last two decades a marked reduction in the amount of oats grown has accompanied a
246 decrease in the numbers of cattle and an increasing use of hay for fodder. Nevertheless only about 17½ acres of hay altogether are cut, and only five of the crofters sow any grass seed.

251 In August 1958, the township supported only 13 cows, 3 young beasts and 8 calves. Half of the crofters have a cow and a calf, but three have no cattle at all, and one even used condensed milk, a sad commentary on the state of crofting in Orinsay, but a phenomenonby no means uncommon in crofting areas.

161 Table XIX summarises the population structure and trends for the four districts. It is signif
162 that the two districts without service centres, which provide a range of ancillary employment, h
166 experienced more severe depopulation since 1939. This table also underlines the fact that earni
167 from seasonal employment are insufficient: the incidence of permanent employment furth of the
434 districts is three times as great as the incidence of seasonal employment.
464

APPENDIX B

SHIELINGS - A NOTE

John E. Wearmouth with illustrations by Beth Blowers

195 From Figure 1, compiled from the First Edition six-inch map of the Ordnance Survey (1850
232 to 1852) and from personal observations, it is clear that the shieling system was at one time an overall feature of Park for the whole peninsula has traces of this transhumant economy.

361 The rudimentary structures, some of turf, others of stones and roofed with bracken or
342 heather thatch, are all sited on well drained sites, the majority on mounds. Almost all the sites are close to lochs or streams. The majority are in loose groups of from two to nine buildings, although there are some in isolation; no site has as many as twenty-six buildings as found at Airidh na Gaoithe in North Uist.

342 There appears to be two distinctive shapes of building - oval and rectangular (Fig.10).
All shielings measured exhibited a remarkable similarity in dimensions, from 17½ by 9 feet to 13 by 12 feet. The oval structures are generally larger than the rectangular ones. Most of the shielings had two entrances, often, but not always, opposite each other.

195 The shieling system died out in Park about 1880 but the cattle continued to graze around the
232 shielings on the better grass, and the crofters had still to go out to milk the cattle at the shieling although they no longer lived there. The sheep still use the mounds for shelter and grazing. These features of an obsolete economy are still easily recognisable from the luxuriant grass cover in a wilderness of peat bog and bare rock.

APPENDIX C

NORSE SETTLEMENTS NAMES IN NORTHERN PARK, LEWIS

Bridget M. Gordon, B.A., B.Litt.

183 See: Magne Oftedal, The Village Names of Lewis in the Outer Hebrides; in Norsk Tidskrift for
183 Sprogvidenskap, vol. XVII, 1954, (Oslo), pp. 363 ff.

183 Professor Oftedal points out the difficulties of these Norse-Gaelic settlement names: inaccurate spellings even in modern times, and lack of any useful evidence from older sources, make almost all the derivations a matter of conjecture. Sometimes two or more ON equivalents are possible (e.g. for Calbost), sometimes no satisfactory solution can be found (e.g. for Lemreway). Since Professor Oftedal frequently bases his explanation on pronunciations not recorded in written forms, his evidence is largely followed here.
SHIELDERMISH: the second element is N nes, 'headland'. Oftedal's explanation of the first as silda, genitive plural of N síld, 'herring', is satisfactory linguistically, but seems unlikely in meaning.

221 rams are put out in November, the pace becomes slower, the
231 main job being the feeding of cattle.

434 The economy is neither a subsistence nor a self-sufficient economy for the majority. All but a few large crofters have to supplement their income from the croft with some form of outside employment or independent source of income, for ex-
427 ample, contributions from a child or a pension. For many the
361 croft is no more than a home. For an aged person, it provides a means of living cheaply. The rent, which is fixed by law,
427 is only nominal, and the taxes are negligible. There is more to
571 crofting than simple economic considerations. Indeed, if it
361 were only a matter of economy, the system would have been
[559] abandoned long ago. It is a way of life in which the individual finds meaningful patterns of interaction and an ascribed status compatible with his aspirations. The land is more than a potential source of income. It is the ancestral home. The tie to the land is an expression of the sentimental bond of kinship.[12] Many, perhaps the majority, have spent a good part of their lives in other parts of the world working for a wage and looking forward to the day they might return to the Misty Isle. Although only the Glendale crofters are land owners, the law has given the tenants complete security of tenure and the right to bequeath the croft to a member of their family. Thus, they can return to their township and find solidarity.

[12]Cf. Ibid., pp. 64, 81.

Non-crofting Economic Activity

464 Employment opportunities on the island are limited. The only industries are a small malt distillery, which employs thirty men, a small wool textile mill where about 15 men and 15 women find work, and a few gravel and sand pits. There is a promise of greater employment opportunities in the extraction and processing of diatomite and in forestry. A few men are fishermen. The majority of men who work for a wage are seasonally employed in service operations, especially county road workers, bus and truck drivers, and general laborers. A number seasonally migrate to the mainland during the winter or go to sea. Women find employment in hotels during the summer or local shops. There are no active household industries. Many young women spend the summer on the mainland in domestic service. In several areas the crofters are dependent on the tourist trade for almost all of their income. The summer tourist trade is one of the most important sources of revenue for the island.

The Settlement Pattern

361 The settlement pattern on Skye, like the system of land use, is an ecological adaptation of the culture to the environment which has been stabilized in its essential details since the Neolithic. The areas of permanent settlement have always been limited to the coastal fringe and a few internal glens, regions with the best agricultural conditions, and to elevations under 400 feet. Further, man has tended to concentrate on the

361 basalt plateau where the light and potentially rich soil and the relatively luxuriant pasture land are valuable assets. The remainder of the island has been generally avoided, except for a few isolated areas of mixed beaches, moraine, and similar
361 deposits of local importance. The contrasting population
162 densities in modern times support my assertion. With an overall density for the Island of thirteen per square mile, northern Skye has a density of nineteen per square mile in contrast to six per square mile in southern Skye. This three to one ratio has persisted for at least two centuries.

361 Until the nineteenth century all the inhabitants of Skye lived in isolated hamlet-like clusters. The majority continue to dwell in dispersed crofting communities. Indeed, the dominant characteristic of the settlement pattern is, with a single exception, the lack of nucleated villages. Skye is not unique in this respect. The Irish and the Welsh have never made the village a part of their cultural heritage.[13] The pattern I am about to describe will, no doubt, be unfamiliar to many who are only acquainted with rural communities of the Western Hemisphere. The units of settlement on Skye are on a very diminutive scale compared to those to which we are accustomed.

361 As we have seen, the efficient socio-economic unit is the
621 township, the collection of individual crofts and the communal grazing lands. Skye contains 182 townships. All of them are found in an inhabited area of roughly thirty square miles.

[13]Conrad M. Arensberg, The Irish Countryman (New York: Peter Smith, 1950), pp. 146-155; and Alwyn Rees, Life in a Welsh Countryside (Cardiff: University of Wales Press, 1951), pp. 128-129.

Township size is variable. There is a complete range from 361
one township with a single inhabited croft and a population of 621
three, an old man and his two sons, to one with fifty crofts, [163]
held by thirty-two families, and a population of almost eighty. Most townships contain between six and twenty crofts.

The crofts are set out in long, parallel strips, typically, at right angles to the coast, or, if the township is in a glen, across the glen. In the older townships, the houses tend to be built at one end of the strip on the least productive land. The byre, if there is one, stands at the rear or either side of the house. Exposure or road access have not always been determining factors. Most frequently, it would seem, alignment along a road is present only because the county government has built a road into the township. Only in the more modern townships, those planned or re-organized within the last fifty years, have the crofters tended to build near the road. Several of the townships lack any apparent orientation. The houses are scattered up and down the lower slopes of the hills which rise above the cultivated land.

Wherever the configuration of the land and the environmental factors of soil and rainfall permit large settlements, there is a grouping of townships into the pattern of the British open country neighborhood or the French line village.[14] Scattered among the crofts, without any nucleus of community [366]
buildings, there are, usually, a school, one or two churches, [349]

[14]For an analysis of rural settlement patterns, see Loomis and Beegle, op. cit., pp. 229-231, 234-237.

and the homes of the ministers and the teacher. Standing 621 368 together, within a few hundred yards of each other, they provide a focal point for the surrounding area. The remainder of the buildings which we normally think of as forming a village nucleus are widely dispersed. The post office, which 621 is also a general store, is just over a mile north of churches 366 368 and school, in the township of Kilvaxter. Another mile away, off the main road, in Borneskettaig there is a small shop. South of the churches and school, almost two miles away, there is a shop and a smithy in Linicro. The remaining shops and workshops are similarly scattered hither and yon among the crofts.

Glendale shows much the same pattern of settlement. 361 621 Stretching along the shore of Loch Dunvegan, through Glendale, on either side of the Hamara River, and out along the shore of Loch Poolteil, there are 156 crofts in 11 townships. These are the homes of 144 crofters. The total population is in the neighborhood of 350. Like the people [491] of Kilmuir, the Glendale residents have also become dependent on roads, and they have tended to build their new cottages near a road of some sort. The single church, the post office, 348 621 and the shop stand fairly close together near the center of [366] Glendale. One school is about a mile away in Borrodale, and the other over a mile away in Colbost. Neither Glendale nor Kilmuir have a village hall. When the Glendale crofters have a meeting to discuss the club farm or when the Kilmuir crofters hold a club meeting, they use the school. Now let 621

*175 the land into large commercial farms.[26] Even had the landlords *178 182 desired to emulate the results achieved elsewhere, it is doubtful 427 that the persistent demands of the steadily increasing numbers of people for a share in the land could have been disregarded at this time. On Skye, as in most of the Western Highlands, the arable of the old farms was simply divided into as many equal shares of five to ten acres as possible. The grazing lands continued to be held in common and used under a system of stinted rights, and the arable was used communally between harvesting and spring ploughing. Lacking any legally recognized traditional or written right to the land, the people remained tenants at will, enjoying hereditary tenure as long as they had the good will of the landlord and, especially, that of his factor.

The people, then, were each given a precisely equal share, which was often assigned by lot, in the old farms. Just as the old infield and outfield system had functioned to provide each man with a bit of the worst and a bit of the best soil, the shares were set out in long strips. After the former joint-tenants and subtenants received their fixed allotments, they moved their dwellings from the small hamlet-like clusters near [621] the center of each farm to the individual plots. The township [361] settlement patterns, as we now know it, came into existence.

The effects of this rather superficial reorganization

*175 Not only were villages completely alien to his heritage but
*178 also he had neither the need to purchase commodities nor the
361 opportunity to accumulate a surplus for buying more than a
621 little grain or an occasional necessity. Whatever his small
511 needs, they could be satisfied locally, especially, by turning to a local tacksman or the estate factor, both of whom made grain and a few sundries available on an extended credit-with-barter basis.

*175 Plans were drawn up for the establishment of a village
*178 at Portree shortly after the Forty-five.[29] Over fifty years
361 later the best that could be said of Portree was that it had
621 "the appearance of a village."[30] Another attempt to bring a village to Skye was made in 1787 when a group of exiled Highlanders in London built the abortive fishing village of Stein.[31] As a part of the reorganization of the MacDonald estates, villages were laid out at Portree and Kyleakin sometime after 1811.[32] Kyleakin failed to develop.

[368] By 1820 Portree had become an administrative center with its own jail,[33] one of the hallmarks of civilization.

*175 District Council was established, but the only functions left
*178 to the Islanders were such minor ones as providing recreation
657 grounds and maintaining footpaths. Today the members of the
621 Council can only make the local needs known to the county council and carry out the functions of the county council.

*175 In more recent years the functions of the county and
*178 national governments have increased still more. Government
657 employees have multiplied. After the Second World War, the
[36] county became a landlord, building subsidized housing. Since
[36] the county has built these houses at Portree and at a few centers such as Broadford, Uig, and Dunvegan, where the police have their stations, they are still persisting in the attempt to
[49] bring villages to the island. Roads have become the concern of the county. Within this period, then, the crofter became dependent on the county and national government for the satis-
[18] faction of many of his needs. Although he resents authority, he has not shown any resentment at the continual encroachment of the government's services. To him the government is a "rich man" who has bestowed many favors and may be asked to bestow a few more, like electricity and plumbing.

*178 Like European peasants in general, the Skye crofters
181 have lost three important things: isolation, political independence, and self-sufficiency. At the same time, they have retained a good deal of their former identity, a continuity of culture, and an attachment to the land and to the traditional way of life. The culture has been modified by adaption to the higher socio-cultural organization, especially in material

*175 crofting system. Both the communal nature of the system and
*178 the smallness of the crofts deter improvement. Although the
427 government reversed the trend toward making the land an im-
241 portant source of wealth and individualization of the land, by
[84] replacing customary forms of tenure with national laws of tenure, and has tried to correct the disadvantages under which the crofter labors, if not always successfully, the Skye crofter has made only a partial adjustment to the larger,
[34] specialized national culture. In fact, the land is used less systematically than it was in the past, in the times of the
[31] shielings. The crofters have not only ceased trying to reclaim arable but also have allowed much of the arable to go back to grass.

*175 Ever since the closing years of the first period of
*178 the modern era, Skyemen have sought employment as a part of
464 the national labor force. During the third and fourth periods, they joined the landless labor force in the Lowlands. There is practically no local opportunity for a landless man to support a family. The majority must remain pastoral agriculturalists who depend on seasonal employment, or some other form of financial assistance, to augment their income.

*175 Improved communications and the ensuing development
*178 of commerce has brought a village to the island. It functions
361 as a market center and as the administrative center for the island. It has not served to bring the island together; it is still something alien to their heritage. Accompanying the growth of the village, there was local development in the

#175 #178 361 crofting districts. Shops, schools, inns, and churches increased in numbers, but they have not clustered to form a village nucleus. In more recent years the county has tried to stimulate village growth by building houses at a few centers. Someday they may succeed in altering the settlement pattern.

#175 #178 657 As a consequence of the increasing integration of the Gaelthanach within the national scene, government regulations have expanded and have come to be enforceable by a local police. Government services too have increased in scope. Many of the traditional functions of the family and the local group are now functions of an ever increasing number of government employees. Nevertheless, the traditional statuses of the members of the group have persisted and social control has not been reduced in favor of action by the state.

#175 #178 565 The class structure has changed several times. It has vacillated between a leveling of socio-economic differentiation and a growing polarity of status. At present there is no local class structure beyond the old polarity of landed gentry and crofters. Those who fall between these groups are ranked [59] on prestige values of long standing. Even though many of the intermediate group would be working or middle class if they lived elsewhere in Britain, on Skye personal factors play a more important role in determining prestige than socio-economic differences. Leadership and political power remain in the hands of the gentry.

#175 #178 182 771 If the foregoing material suggests that there is evidence on Skye for Redfield's concepts of disorganization

361 632 162 The number of holdings which can be carved from the la in any one place and the proximity of these clusters of crof to each other are determined to a large degree by the limiti influences of the environment. Landforms, climate, and soil have always restricted settlement to the coastal fringe and a few internal glens. Although the Sgiathanach has abandone his former dependence on a subsistence economy, the original cultural adjustment, these natural features continue to exer a negative influence. Each man must have some arable land t provide winter feed for his cattle and to winter his sheep.

If the low-lying area is small and isolated, only a few holdings can be laid out. If the fertile area is large, the influence of the environment is less direct. In either case social and economic factors are important. The small isolated townships are invariably unsuccessful. A few, like Point of Sleat, are completely empty. Others are all but derelict. There is Kylerhea in Sleat where no children have been born in over fifteen years. Suisinish in Strath, a township well remembered from the days of the "Clearances," a minister's sheep replaced the inhabitants, is now inhabite by an old man and his two elderly bachelor sons. All of the 476 231 162 failing townships are at the end of a road. Whereas the minimum size was once four able-bodied men, the number in a plough team or a boat crew,[12] it is now three. This functio trio is indispensible for the care of a sheep stock large enough to be worth keeping. Even three families do seem to satisfy the social minimum.

---

[12] Ibid., pp. 1-2.

[Marivig] [Calbost]

In conclusion, it may be said that the problem of Marivig's future, and that of other crofting wnships, is not only one of adverse aspect, soil and weather conditions, and of distance from arkets, but a problem of the population finding a stable and viable level where agricultural units re large enough to encourage the active and enterprising section of the population to remain, and problem of finding capital to equip a modern fishing fleet.

CALBOST

Anne Cooper

Calbost is situated five miles to the north-east of Gravir on the Minch coast of Park. It occupies basin-like hollow in the centre of which is Loch Dubh, and is open to the sea on the east. The roft houses are scattered over a shelf 50 feet above sea-level round the sides of the hollow and ong the valleys which enter the township to the north and south-west.

The cultivable soil, a mixture of peat and well-drained gravelly drift, is on the higher ground, though here the rock outcrops in many places. On land formerly cultivated, bracken is spreading pidly and now covers a large proportion of the surface, although twenty to thirty years ago it as unknown. Heather dominates the common pasture and rushes are widespread in the low-lying entral area. There are a few willows and rowans round the old buildings, probably planted as ind-breaks.

Calbost was originally a single farm but the township was formed about 1820. The pattern of e crofts differs from the usual shore-to-dyke alignment, as six crofts were allotted extra land the valley which enters from the north, when a part of the common grazing was brought within e township dyke. There are now fourteen crofts of which four are worked by resident crofters nd two by squatters. The remainder are used only for hay and grazing and are sub-let to crofters Calbost and other townships.

Cultivation is entirely by spade and of the 2.6 acres now in cultivation, potatoes account for 37 acres. The small acreage of oats reflects the greatly reduced cattle stock of only two cows and vo calves. Approximately twelve acres of hay are cut as winter feed for the 225 sheep which graze the township.

The lazy-beds in natural hay and the outrun are being rapidly encroached on by bracken. The revalence of bracken, and the amount of work needed to clear it, is likely to deter any attempt at enewed cultivation.

Calbost was originally a fishing township in spite of its harbour being so exposed: boats have to taken up on the shore instead of being moored in the bay. The decline of the fishing industry whic as prevailed in Lewis has contributed towards the almost complete desertion of Calbost, leaving nly a few boats now used only for leisure purposes. Croft income is supplemented by only two of e men in the township, one a weaver and the other in the Merchant Navy. Although there are a few roductive gardens, no attempt is made to market any produce.

The township dyke is very close to the settlement and in the past shielings were not so widely used Calbost as elsewhere. The cattle were instead brought near to the dyke for milking and allowed graze on the common unattended. There are ruins of shielings to be found on the hills around albost but a more interesting feature is the second dyke; enclosures were made adjoining the main yke and in the late summer the cattle were brought to fresh pasture within these dykes before e opening of the township gates. Following the opening of the gates the stock are free to wander ver all crofts but there seems today to be a move towards the complete enclosure of the crofts.

[Caversta] [Cromore]

14-18 war had a marked effect on the Caversta population - 16 out of 54 (29 per cent) left after d no re-population took place. Since 1939, seven people have migrated to Stornoway or the nd, (16 per cent of the total 1939 population), and six of these were from Torista (i.e. 50 t of the 1939 Torista population); only one family now remains there. The demographic n is becoming more acute for there are no young married couples and no youngsters growing e girls have left to marry and most of the men have sought temporary or permanent employ- sewhere, for with better communications, education and the radio, the pull to the towns has stronger. There are now only two people in the township who could be described as full- rofters, earning no supplementary income by weaving tweed on commission from the Stronoway

ersta is not one of the most progressive of the South Lochs townships. Although the crofts ced, the common pasture is not visibly delimited from either the Cromore or Garyvard s. At present, the grazing is fully stocked according to the soum, but the committee has not initiated any re-seeding schemes. As the pasture is not of the best quality, some newly sown would benefit every crofter. Lack of manpower may in part account for this deficiency but even acreage of re-seeding would be a great asset.

future position of the township is rather doubtful: it is not the best type of land for mechanisa- d is badly served by communications. The future of Torista appears to be probably one of nment, unless it is more easily linked with Cromore. The possibility of a good road being re is remote, as there is only one family to serve. The main part of Caversta is also open tion. Amalgamation of the crofts would not necessarily make more efficient units for the units are not used to their full extent. Amalgamation with Garyvard might benefit the p a great deal, as the Caversta population is rather small to flourish in isolation. The future vard, Kershader and Habost is one of hope, but unless some change takes place soon, it is icult to see Caversta, and Torista, following the same course as Calbost and in thirty to are being little more than grazing land.

CROMORE

G. Mary Swindell, B.A., and Dennis F. Fancett, B.A.

more is situated on a peninsula between Loch Erisort and Loch Cromore. Approaching it e access road, Cromore has the appearance of a nucleated settlement, but in fact each s situated on the owner's croft. The crofts are so arranged that each has a portion of land more level surface of drift deposits; houses 1 to 20 stand at the junction of the drift and the n gneiss. Soils are poor and thin, and there are numerous outcrops of barren rock amongst ble land. The natural vegetation is heather moorland with extensive patches of rushes and grass, the pattern of most of the 'outrun' around Cromore.

township comprises twenty-seven crofts and there are twenty-seven working units; two are subdivided while another four form double crofts. In addition there are five cottars and oolhouse feu. Outside the township dyke there are two feus and four squatters. The croft differs from most other townships as each croft is in four non-adjacent pieces, one piece the house, another above Creag Cromore and two pieces on another area of enclosed land common. Two crofts on the eastern side of Loch Cromore, have most of their arable land the croft-house while three crofts have only one share in the other area of enclosed land.

ll this decade all the land around the houses, and much of that above Creag Cromore, was ly cultivated. Some of the lazy-beds on the higher land are being cut for hay this year but ion is limited to the land around the croft houses and is completely unmechanised. The only t present are oats and potatoes and these are usually grown in rotation. The crofters sowed

[Marivig]

There are only fifteen cows, two yearlings and four calves in the township, and the crofters with no cow rely on neighbours, or on tins, for their milk supply. All but two of the crofters keep sheep, there being four hundred and eleven ewes, one hundred and eighty-five sheep and two hundred and thirty-four lambs belonging to the township. The common grazing (including the off-shore islands which are grazed by five different crofters each year) is used for the sheep in summer, while all but one of the crofters winter their sheep within the township dyke on the crofts. Most crofters keep hens, and surplus eggs are sold to the Stornoway vans.

Peats cut on the common are transported by lorry to the crofts, while peats from the north end of the peninsula separating Loch Marivig from the sea must be carried in creels.

Nearly every crofter owns a rowing dinghy which is moored in the loch off the end of his croft, and with this supplements the family food supply. One herring boat, operating nightly from Stornoway and returning to Marivig at weekends, is all that is left of a fairly large fleet which operated before the war. A second boat, unused for two years, lies shored up on the beach, and two others are wrecks. Over fifty years ago there was a curing station at Marivig. One crofter fishes lobsters during the winter and markets them in London.

Of the other crofters, only two supplement their incomes by weaving, one by working on the roads while several men work partly on the crofts but are periodically away whaling in South Georgia, fishing, or on hydro-electric schemes. Several others are in the Merchant Navy. The gradual migration from Marivig, especially of the young people, is reflected in the high average age of the permanent residents, and in the numbers in the school -over one hundred pupils in 1900, thirty-nine (including sixteen from Calbost) in 1946; but only nine (none from Calbost) in 1958. The young people leave the township to train or work on the mainland (generally in Glasgow) or in Stornoway, while their elders accept the view that "there is nothing for the young people here".

The township has a Post Office and telephone kiosk which also serve Calbost, while lack of a shop is partially compensated by a choice of four vans from Stornoway and one from Gravir. There is a daily bus from Gravir via Marivig to Stornoway and back: the return is over 10/-. The road which reached the township from the west in the late 1920's has a tarred surface and is much better than the later road southwards to Gravir which is untarred. There is no church in Marivig and most of the population attend the Free Church in Gravir.

Within the township the two arms of the township road serve all but two of the crofts and the sites of the newer houses, few of them more than thirty years old, tend to be near the road, while the ruined houses found on most crofts are often nearer the sea. Only two thatched houses remain and the other inhabited houses are built of stone roofed with asbestos slate, or of corrugated iron. All the crofts are supplied with electricity from the grid, but very few have a piped water supply; rainwater is collected from the roofs and piped for washing, with a separate piped supply from a well for drinking. All other houses draw water from wells.

The stormy winter weather, rocky terrain and poor soil are all blamed by the residents for the drift of population away from the crofts, but those who remain have little incentive to work the crofts more efficiently owing to the very hard labour involved. It is suggested that with more intensive cropping and more cattle, each croft could make a comfortable profit and surplus milk, potatoes and eggs could be marketed in Stornoway - the milk replacing that at present brought from the mainland. Such development, perhaps on a co-operative basis, together with a revival of the fishing industry and introduction of a tourist industry, by building a small hotel or guest house and attracting anglers as well as those who simply wanted scenic beauty, might bring prosperity back to a township which otherwise may well be derelict in the next twenty years. But the capital required for the two latter enterprises is not available within the township.

361 one or more country stores, a few workshops, and a post office.
621 Kilmuir will serve as an example of these larger settlements.
364
[348] Along the shore of Loch Snizort, on the peninsula of
361 Trotternish, there is a broad, fertile plain. Including old
621 Loch Chaluim Chille, there are approximately ten square miles
311 of good land. Although the soil is not cultivated as intensively as in the days when Kilmuir was "the granary of Skye," this is regarded as the best agricultural region on the island.
[162] In all there are 122 crofts, held by 105 crofters, in 9 townships. There are also two small farms. The population is slightly over 300.

361 The crofters' cottages are loosely strung around the
621 old loch and across the plain in an irregular "Y" shaped pattern (Figure 3). Basically the pattern resembles the French line village, but there are several features remi-
361 niscent of the British open country neighborhood. Most of
621 the cottages, it would seem, were originally built on the
491 landward fringe of the plain and along the shore of a small bay, known as Camus Mor, without any regard for road access.
[178] In recent years, increasing dependence on motor transport has led to demands for roads. Now almost all the crofters, except those in Bornesketaig, have a paved road running by their door. About a third of the houses are on the county road which encircles the peninsula and links Kilmuir with the outside world via Portree.

621 In the center of Kilmuir, in the township of Balgown,
348 stand two spireless churches, a church hall, a two room school,

THE ISLE OF SKYE SETTLEMENT PATTERN IN KILMUIR.

CHAPTER VI

THE ISLANDERS' SOCIETY

The Units of Social Organization

Since the Sgiathanach has consistently been more bound
locality groups than the relatively mobile members
main stream of Western Society, I think that we shall
pause to review the character of the social systems
are primarily based on territoriality a valuable aid
understanding of how cultural continuity has been
ved. By now we are all well aware of the fact that the
ip is the efficient economic unit. It is also a social
. The members of each township display a consciousness
mon interest, symbolized by the communal hill grazing;
eir inter-personal relationships, reflecting ties of
p and friendship, reveal a rate of interaction second
o those of the crofting family. In most of the town-
the people are related and re-related on both sides
cent and marriage. Laid out along the coast or in a
e glen, with the cottages on the individual crofts,
a discernible form. The township is a small cluster
e to twenty homes; approximately an equal number of
-like farms, stretching out behind the houses; and,

361 above the settled area, the hill. In its spatial exi
the township is normally bounded at either extremity
more similar clusters of homes and patches of land.

621 As it exists in space, so it exists in time. A
571 for the removal of the population during the "Clearanc
and for a certain amount of arbitrariness on the part
government commissioners responsible for replanning du
past fifty odd years, the majority of the townships ar
cended from the old farms on which the clansmen lived
and subtenants. On the rent rolls and in local tradit
the townships bear the names of these long forgotten f
The functions of the township include the provision of
of livelihood and systematic arrangement of social rel
ships. Both functions are made possible by the formal
and are facilitated by the informal organization of th

The next significant social unit is the neighbor
This is not the neighborhood of current American socio
and anthropological usage; it is the Old World open co
neighborhood. As such, it corresponds to Murdock's co
"the maximal group of persons who normally reside toge
in face to face association,"[1] and differs from MacIve
definition of neighborhood, "the first grouping beyond
family which has social significance and which is cons
of some local unity."[2] MacIver's simplest community,

[1]George P. Murdock, Social Structure (New York: T
MacMillan Co., 1949), p. 79.

[2]Robert M. MacIver, Society: A Textbook of Sociol
(New York: Farrar and Rhinehart, Inc., 1937), p. 148.

621 calls it, is my township. Nevertheless, since I share Kroeber's
571 feeling toward the free coinage of terminology,[3] I shall not look for a new word.[4] The neighborhood on Skye is a collection of townships which are separated from surrounding clusters by
● 361 topographical features. Along the coastal plains and up the glens stretch the crofts, some parallel to each other, like the French line village, and others spread out in the checker board form of the true British open county neighborhood. Scattered among the crofts, one finds one or two shops, a few workshops, and a post office. The focal point for the members is provided by the church, or a pair of churches, and the school, which more often than not stand together. There is no other nucleus of community buildings which even approximate a village center.
621 Social factors as well as geographical features play their
571 role in determining the extent of the neighborhood. It has been suggested that the upper limit for the size of a group is determined by the prevalent form of their economy which limits the possibility of forming close contacts with habitual attitudes.[5] Although the neighborhoods and the component townships contained many more people a hundred years ago than they do today, all are now within the maximal figures suggested by Linton and Murdock for agricultural pastoralists, 350 and

---

[3] Kroeber, Anthropology, p. 261.

[4] I suppose Murdock's "deme" would be an acceptable substitute (op. cit., p. 63). Arensberg has used Einzelhof to describe the Irish pattern (The Irish Countryman, p. 43)

[5] Murdock, op. cit., p. 81; and Ralph Linton, The Study of Man, p. 218.

362 of new steadings. The average amount of loans (totalling
652 £166,000) was under £150; repayment has been satisfactory, and the arrangements made by the Department of Agriculture won general praise among the people. Yet 1200 houses were very far from replacing all the 'black houses', and many more are needed.

433 In terms of cash profit, ten crofters today run their
427 crofts less remuneratively than the farmer they dispos-
sessed; even together they may show little more total
241 production than the farmer. Nevertheless, these ten crofts each allow a part, at least, of the basis for a country home.
[423] Hence the weight of public opinion supported, nay, insisted on 'giving back' the land to the descendants of those who
654 had worked it sixty or a hundred years before. The State
423 bought the farm stock at a high valuation, and till lately without adequate reform of crofting use and wont. The farms having now been divided, a great emotional issue, which had smouldered for half a century, has been brought to an end. Although the practical results are small, the crofters feel that justice has been done, and that fact may
311 be a great gain. Now that there is no more green reclaimed land to be had, the reclamation of the peat moor, or the grey 'skinned' boulder clay has to be faced.

By financing the renewal of Leverhulme's brief attempt to reclaim deep peat on Arnish Moor, south of Stornoway, the Canadian, T. B. Macaulay, made a resolute attempt to
[241] solve the island's main agricultural problem. Good crops were grown, potatoes and silage produced, and a dairy farm established. But the difficulties called for continuity of effort and research. From the practical point of view of 'demonstration' it had been a mistake to tackle deep and almost level peat, black in colour and viscous in consistency.
[407] There was not the light machinery required for cultivation.

(c) House-building. — From 1920 to 1940 the Department of

APPENDIX I

647 Agriculture advanced loans for the erection of 760 new houses
654 and the repair of 220 other houses. This, with the erection
746 or repair of 40 steadings, may be taken as the equivalent of 1000 houses in the 20 years of peace, of which three-fourths
• 362 were new. Rural building was at its height in the early 'thirties,
356 but 1938 was a typical year. Taking the value of each house as £600 and subtracting half for imported materials, we may
431 assume that for 50 houses built that year the labour given produced an output of £15,000. In addition, some house-
362 building and repair was done without State aid, for which a guess of £15,000 may be made. Such sums may not appear
356 large, but they correspond to the enduring fulfilment of a prime
[435] need, a 'real wage', of importance when compared to rents and costs elsewhere. Of the expenditure on house-building in Stornoway burgh during 1938, the value may be assessed as £10,000, of which £9000 was for Local Authority housing. Most of the total was produced by local labour.

(iii) *Fishing Industry—Net Output and Earnings*

434 (a) For 1938 the total catches, prices and quantities of fresh cured fish landed in Stornoway District show a value of
228 nearly £100,000 (£98,000) for the herring catch, and of £162,400 for the cured herring. Our problem is to estimate what fraction of these sums may be included in the net output of the Island
[127] industry proper. The Fishery Board's *Statistical Tables* and *Annual Report* extract the produce brought in by local boats from the total, separating it from that due to 'strangers', and so permitting a fairly reliable estimate, checked by local enquiry.

228 Of the herring taken, nearly 80 per cent were caught in the summer fishing, June to August (*Annual Report*, p. 13). The
501 week of maximum local activity in herring fishing for Stornoway District may be taken to be characteristic of this pre-war period (Table 8). There were then 111 steam-boats engaged; and as only five were locally registered (at Stornoway itself), the remaining 106 were strangers. There were also 66 motor-boats engaged and though 81 motor herring-boats are locally

178 for an average year (such as 1953) for Local Authority Housing,
362 we may allot half this to net output of local materials and to
647 wages earned by Lewismen, some £65,000, of which rural
63 wages were a small fraction, say £20,000.

435 For crofters and cottars, however, in 1953, a fairly typical
434 year, there was much local effort and achievement, by help
647 of 180 loans and grants from the Department of Agriculture
654 for Scotland, totalling £81,000 for new houses or house im-
426 provements (with a very few steadings). £80,000 may be
allotted to local materials and to labour paid or given by house-
holders themselves.

*175 District Council was established, but the only functions left
*178 to the Islanders were such minor ones as providing recreation
657 grounds and maintaining footpaths. Today the members of the
621 Council can only make the local needs known to the county council
and carry out the functions of the county council.

*175 In more recent years the functions of the county and
*178 national governments have increased still more. Government
657 employees have multiplied. After the Second World War, the
[36] county became a landlord, building subsidized housing. Since
[361] the county has built these houses at Portree and at a few center
such as Broadford, Uig, and Dunvegan, where the police have
their stations, they are still persisting in the attempt to
[49] bring villages to the island. Roads have become the concern
of the county. Within this period, then, the crofter became
dependent on the county and national government for the satis-
[181] faction of many of his needs. Although he resents authority,
he has not shown any resentment at the continual encroachment
of the government's services. To him the government is a
"rich man" who has bestowed many favors and may be asked to
bestow a few more, like electricity and plumbing.

*178 Like European peasants in general, the Skye crofters
181 have lost three important things: isolation, political
independence, and self-sufficiency. At the same time, they
have retained a good deal of their former identity, a continuit
of culture, and an attachment to the land and to the traditiona
way of life. The culture has been modified by adaption to the
higher socio-cultural organization, especially in material

247

I hardly need to add after our discussion of the islanders' 582 427
conomy that the chances of a young couple finding a vacant
roft are slim. It may be of interest to indicate just how slim
hey really are. In 1953-54, in 82 townships, which I visited,
here were only eight vacancies. Six of these were no larger
han cottars' gardens. There were no vacant holdings in Kilmuir
r Glendale. I am not talking about derelict crofts in the
ands of absentees. Moreover, if the individual decides that 464
orking in Portree is better than leaving the island, his 582
rospects are no better. The County Council had sixty-six units 362
n a public housing scheme under construction, in 1953, in
ddition to fifty-six completed since the end of World War II.
here were three applicants for each apartment. The county
anitary engineer, who was responsible for allocating the a-
artments, began to think half the population of Portree was
ying, and the other half was dead. In order to get priority,
he people were claiming disabilities, "some of them with names
s long as your arm." Many of the people, especially young
eople, regard winning out in the competition as an indication
f status. But we are getting away from the croft. We still
ave to consider how a person gets possession of the croft.

As we know, the crofter has the right to bequeath his 427
roft to a member of his family; however, he seldom bothers 428
o exercise his right. Here is another example of their
ncomplete adaptation to the higher socio-cultural level. The
and and the house have very little monetary value. Usually,
he man who leaves a will has been talked into it by an
fficer of the Department of Agriculture. He, then, assigns

Unlike the township, the neighborhood typically has no rmal organization and is not necessarily a cooperating, conomic unit. Always, of course, there is a consciousness common interest. In the case of Glendale this is spiritually mbolized by the church and economically, by the large club rm in which all the owner-occupiers have a share. In Kilmuir here are two churches, standing close together, and the crofters ve a common economic focus in the drained loch which all use equal shares for meadowland. There is also a crofters' club. rther symbolization of their common interest is provided traditions, memories of notable personages and events culiar to themselves. Always, the consciousness of common terest is expressed by a feeling of superiority over the mbers of other neighborhoods.

There is but one trade-center village on the island, e village of Portree.[7] It is the only true nucleated settlent. Built on the squ but still retaining the appearance an overgrown hamlet, it is a small grouping of non-agriltural dwellings, government offices, churches, shops, a school, d the homes of those who make their living by serving the ral areas. In addition to its function of providing goods and rvices for the surrounding neighborhoods, it also links the land with the outside world. Although thirty-six miles from e mainland, it is the entry port for the government officials,

"I couldn't get back my health, but I didn't want to go home, because the houses weren't so good there as on the mainland. I went to work on a farm. It was for the cream I was going. I was so weak I couldn't lift the milk pails for a week, but I got on so well with the old lady that the farmer let me stay in and keep her company. The other girls were always running off to dances and out late at night, but I didn't care about that. I stayed in with her, and got so pally with her that the others were jealous."

She had been coming back every winter to be with her mother, and during the war returned to nurse her until she died. Anna then returned to Glasgow, where she married a widower from the mainland. When he died a few years later, she returned permanently to the island. Although she had not belonged to the Free Church while living in Glasgow, she became a member when she settled permanently in Shawbost.

The Baker

"The Baker" was 22 when the first world war broke out. Many Shawbost villagers joined branches of the armed services at that time. The Baker joined the army, and two months later was wounded in one lung. Tough as salted dogfish and solid as Lewisian gneiss at the age of 78, he pounds his chest and shows visitors his scar. After

ECOLOGY AND PHYSICAL ENVIRONMENT

ditches, indicating perhaps the love of old-time planners for following existing lines and patterns. A plan of Stornoway drawn up by a John Wood in 1821 shows the town's development along definite grid lines with a few main streets, most of which were comparatively long and running south-north, seawards to landwards.

In 1918, when Lord Leverhulme made his bid to centralise the scattered, failing fishing industry of the island at Stornoway, he envisaged a further stage for the town. He began to build new houses, and had a grandiose proposal to reopen the diagonal arrangement indicated in John Wood's plan and centre it on some great new building. This fell through on his departure from Lewis; and since then, building here has become much the same as on the Scottish mainland.

In more recent years Stornoway has seen a kind of suburban development with, in particular, a new housing scheme of private dwellings in the same area as that proposed by John Wood. This area also contains the new primary school. A recent estimate of the cost of the building work, involving new houses and municipal facilities, amounted to almost £3 million. Municipal housing has been provided in smaller areas cleared of older houses. Of the 1600 houses in the Burgh, 50 per cent belong to the Burgh Council or the County Council, the balance being private.

STORNOWAY

701 men served in the various regiments at the front in South Africa, and over 300 in the Royal Navy.

*175 632 [362] In 1796 there were sixty-seven slated inhabited houses in the burgh, twenty-six of which had been built since 1784. Before this date most of the houses followed the constructional pattern of those found in rural Lewis. In 1838,

> Stornoway was, within the last twenty years, only a small fishing village, but from the spirited and patriotic exertions of Lord Seaforth, the proprietor, and the grant of irredeemable feus for building, it has become a place of considerable importance as a fishing station. It has a post office; and a packet sails regularly once a week with mail and passengers. No place in the North of Scotland, and in an insulated situation also, has made more rapid strides at improvement, both in a domestic and commercial point of view, than Stornoway.

[205] [505]

COMMUNICATIONS

*175 205 [32 505 [489] Mention of the sailing packet indicates the tedious manner in which mails came to the town for subsequent distribution in the island. Letters went by mailcoach north to Dingwall, thence by mail-gig west to Achnasheen. Because there was no road from Achnasheen to Poolewe, about thirty miles away, they had to be carried on horseback. The weekly sailing packet then picked up the bags, for which cargo the owners were paid £150 per annum. A letter from London to Stornoway cost 1s 5½d; the smallest enclosure made it double that amount. The mail-packet was often held up by bad weather. It was a wind-blown sailing ship that brought Stornoway the result of the Battle of Trafalgar and the death of Nelson, an event in which a number of Lewismen also took part and died; in St Columba's churchyard at Eye there can still be seen a Trafalgar officer's gravestone. A fortnight after this news arrived, the packet from Poolewe brought its stale message.

*175 439 632 [501] In 1844 seventy boats, ranging from 15 to 150 tons, were working out from Stornoway. The *Gazetteer* for Scotland for that year says, 'The grand trade of the place consists in the exchange of the produce of the fisheries and the kelp shores, for British manufactured goods and foreign produce.

366 going concern to a trust which was set up to receive the gift and
632 whose first object is to assist aged and infirm residents in the
747 burgh. In effect, all profits earned by the shop are passed to the
429 trust for distribution to those in need.

Almost half the houses in Stornoway were built by the local
362 authority. The Town Council has never been afraid of rooting
632 out unfit houses. By 1937, under the 1930 Slum Clearance Act,
[175] one person in four in the town lived in a council house. The housing schemes, though large, have still that element of community with personality, something often lacking in newly developed
362 areas of other towns and cities. The Council also supports private
427 housing by taking up sites, clearing and servicing them and then
632 feuing them to private owners. The rents policy is to have no housing deficit beyond the statutory rate contribution (which works out at between £6,000 and £7,000 per annum). The Council's tenants co-operate with rent collection to a unique degree: collection figures are something like 99 per cent and on occasion 100
362 per cent. A vigorous housing policy is important to the town, as
178 its population is now over 5,300 and still growing, mainly at the
167 expense of the rural areas. Development plans at present envisage
161 a 1981 population of about 9,100 persons within the parish
632 boundary and including the burgh.

632 Stornoway is an island town and is an island's town:
369 its rhythms of life are those of the island, regular and timed by nature, but with an added syncopation—the result of an urban
632 outlook. In this context, Gaelic is the language, though English is
197 the lingua franca. Deeper still in the methods used for communication is a kind of patois based on Gaelicised English, Anglicised Gaelic, with some other words that defy investigation into their origin. Many words find their natural forebears in Scots, American and the maritime tongues of Europe, which might be expected in view of Stornoway's importance as a sea-port of significance a century or two ago. The Stornoway language, as spoken by true-born natives, recognisable anywhere by another native, reflects the life of the cosmopolitan, sea-faring people.

632 Apart from its industrial opportunities, Stornoway has many
871 of the more sophisticated urban facilities that people everywhere
[369] seem to crave, particularly with regard to education. The senior

361 it command and make it the leading settlement of the
366 Hebrides, with a population fluctuating around 5000.[1]
162

2. *Aspects and Problems of the Burgh*

361 The little town pleases by its views over the harbours,
632 outer or inner—sheltering perhaps a steamer or two and the clustered fishing vessels—across to the wooded skyline and the beautiful grounds of the Castle, a-flower in spring with rhododendrons. Or framed in trees from the Castle policies, the harbour and even the roofs and
[342] smoke of the houses are not unpleasing (Plate II). But the town's chief charm is its setting, not itself, though its plain dwellings with 'harled' or rough-cast walls and slate
[746] roofs are simple and inoffensive. In rehousing, the Local
[656] Authority had respected Scottish domestic features. But the greater use of local materials, labour and skill is surely desirable in the Island with its many half-employed men, who need such work to maintain income, health and morale.
• [362] As is to be expected in view of low incomes, and the extremely primitive housing in the country, urban housing
[162] is inadequate. In Stornoway burgh in 1931, 44 per cent, or nearly half the population, still dwelt in houses of one to three rooms, 17 per cent in four (including attics often with no dormer windows), 20 per cent in five or six, and 18 per cent in seven rooms and over. There has been improvement up to 1939, and after 1945, but much remains to be done.

369 Turning to cultural life, profound differences divide
632 the town from the country about it. Whereas in the townships of rural Lewis the people are almost purely natives

[1] The burghal area was extended in 1935. At the census of 1951 its population stood at 4950. This showed an increase of 15·9 per cent above the population enumerated in the same area in 1931.

000 to one another, to the landlord and to the State would have been profoundly different.

(E) STATE AID, THE LAND, AND THE CROFTERS' RESPONSE

175 Until 1914 the congestion in each Island township
162 dotted between the wide, lonely moors, had increased, and
362 it was still increasing. To every two legal crofters, either a cottar or a landless squatter was to be found, on the
175 'skinned land' outside the crofts. Parliament, in 1886,
656 had discarded the Napier Commission's recommendations
648 to give powers to extend the crofts from portions of the common, or to supply a house site and garden space for
[362] men of independent occupations such as fishermen. This congestion embarrassed Government and local services.

427 The associated rating system was also at fault; indeed
656 it has still to be put right. For instance, a crofter's son—able to make a living, say, as a fisherman, and about to marry but having no croft—was penalised by high rates, should he take up his proper status of a legal cottar at a small rent. Throughout the crofting counties, the legal crofter, as an agricultural landholder, was (and is) de-rated, and had only to pay one-eighth the rates for a non-agricultural holding of the same rental. Only since 1938 has the value of the house been assessed. A recognised cottar paying rent to an estate was rated as owner and occupier, being treated in fact as a feuar;[1] and as such he had to bear a heavy burden of rates, possibly of over 30s. in the £. Whereas if he 'lay low' and shared his father's or brother's

[1] *Feuar*, in Scotland one who holds real estate in consideration of a stipulated annual payment; lit. on *feudal* tenure. Cf. J. P. Day (1918), pp. 383-384.

623 The Trustees of the Stornoway Trust have not found
423 it easy to meet the cost of keeping up the valuable property
427 of the Castle and Park, nor to carry the burden of its rates, no adequate income being available for the purpose.
178 Today, however, Leverhulme's gift is being put to good
874 use as a Technical College, opened in September 1952.

311 Division of the available farms, after providing about 200 small crofts (of ten acres or so), still left the problem
427 of finding legal homes on legal tenure for the remaining cottars and squatters.[1] The Department of Agriculture
362 arranged to feu plots of 'skinned land' on the outrun of
656 certain townships, including one in the extreme north and others in Lochs. About 200 of these little holdings with potato ground were provided. On the holders' behalf the Department feued land from the owner, after obtaining the consent of the Common Grazings Committee of the township and permission from the Land Court for 'resumption', *i.e.* for enclosure of a portion of the common. The legal and administrative procedure involved may seem disproportionate to the economic value of the holdings. Yet difficulties of law and custom had been allowed to go from bad to worse during the past eighty years; and these difficulties were overcome.

362 To encourage better housing in the crofting counties,
652 loans are made to 'crofters and fishermen feuars' personally. Local stone, or latterly concrete, is used, and much
[342] of the building is done by the 'man of the house' himself, and his friends. From 1920 to 1940, nearly 1200 loans were made in Lewis and Harris for the erection (or improvement) of houses, and in a few cases for the erection

[162] [1] Estimated at 1200 to 1500 shortly before, the open question was whether subdivision during the previous eighty years was to be recognised and accepted.

hinterland with the outside world, Portree is a center for tourists during the summer. Due to the people's dependence on tourism and also the presence of newcomers, the villagers participate in a number of social activities which are not tolerated elsewhere on the island because of religious asceticism.

Glendale and Kilmuir are crofting communities, each with a population of about 300. All, except the ministers and school teachers, are dependent on the breeding of cattle and sheep and the growing of a limited amount of grain, potatoes and hay for all or a large part of their livelihood. All are bilingual, speaking Gaelic and English. Neither community has a village nucleus, but both have an economic focus. Glendale has a cooperative farm, and Kilmuir has a drained loch which has been divided among the small farmers. The significant differences between them are three. The Glendale people are land owners. In this respect they are rather unique in the Highlands. The Kilmuir residents, like most Highlanders, rent their crofts. The second difference is religious. Glendale is religiously homogeneous while Kilmuir includes church-goers of three Presbyterian sects. Finally, no formal social activities other than an annual meeting of the share-holders in the farm is allowed in Glendale, but Kilmuir has a club organization for the men who gather for lectures and discussions of economic problems.

[Marivig]

131 There are only fifteen cows, two yearlings and four calves in the township, and the crofters with no cow rely on neighbours, or on tins, for their milk supply. All but two of the crofters keep sheep, there being four hundred and eleven ewes, one hundred and eighty-five sheep and two hundred and thirty-four lambs belonging to the township. The common grazing (including the off-shore islands which are grazed by five different crofters each year) is used for the sheep in summer, while all but one of the crofters winter their sheep within the township dyke on the crofts. Most crofters keep hens, and surplus eggs are sold to the Stornoway vans.

Peats cut on the common are transported by lorry to the crofts, while peats from the north end of the peninsula separating Loch Marivig from the sea must be carried in creels.

Nearly every crofter owns a rowing dinghy which is moored in the loch off the end of his croft, and with this supplements the family food supply. One herring boat, operating nightly from Stornoway and returning to Marivig at weekends, is all that is left of a fairly large fleet which operated before the war. A second boat, unused for two years, lies shored up on the beach, and two others are wrecks. Over fifty years ago there was a curing station at Marivig. One crofter fishes lobsters during the winter and markets them in London.

Of the other crofters, only two supplement their incomes by weaving, one by working on the roads while several men work partly on the crofts but are periodically away whaling in South Georgia, fishing, or on hydro-electric schemes. Several others are in the Merchant Navy. The gradual migration from Marivig, especially of the young people, is reflected in the high average age of the permanent residents, and in the numbers in the school -over one hundred pupils in 1900, thirty-nine (including sixteen from Calbost) in 1946; but only nine (none from Calbost) in 1958. The young people leave the township to train or work on the mainland (generally in Glasgow) or in Stornoway, while their elders accept the view that "there is nothing for the young people here".

The township has a Post Office and telephone kiosk which also serve Calbost, while lack of a shop is partially compensated by a choice of four vans from Stornoway and one from Gravir. There is a daily bus from Gravir via Marivig to Stornoway and back: the return is over 10/-. The road which reached the township from the west in the late 1920's has a tarred surface and is much better than the later road southwards to Gravir which is untarred. There is no church in Marivig and most of the population attend the Free Church in Gravir.

Within the township the two arms of the township road serve all but two of the crofts and the sites of the newer houses, few of them more than thirty years old, tend to be near the road, while the ruined houses found on most crofts are often nearer the sea. Only two thatched houses remain and the other inhabited houses are built of stone roofed with asbestos slate, or of corrugated iron. All the crofts are supplied with electricity from the grid, but very few have a piped water supply; rainwater is collected from the roofs and piped for washing, with a separate piped supply from a well for drinking. All other houses draw water from wells.

The stormy winter weather, rocky terrain and poor soil are all blamed by the residents for the drift of population away from the crofts, but those who remain have little incentive to work the crofts more efficiently owing to the very hard labour involved. It is suggested that with more intensive cropping and more cattle, each croft could make a comfortable profit and surplus milk, potatoes and eggs could be marketed in Stornoway - the milk replacing that at present brought from the mainland. Such development, perhaps on a co-operative basis, together with a revival of the fishing industry and introduction of a tourist industry, by building a small hotel or guest house and attracting anglers as well as those who simply wanted scenic beauty, might bring prosperity back to a township which otherwise may well be derelict in the next twenty years. But the capital required for the two latter enterprises is not available within the township.

[Marivig] [Calbost]

000 In conclusion, it may be said that the problem of Marivig's futu townships, is not only one of adverse aspect, soil and weather con markets, but a problem of the population finding a stable and viabl are large enough to encourage the active and enterprising section o a problem of finding capital to equip a modern fishing fleet.

sold, one such causing legal history. The chief garage proprietor in the town applied to use for his business a site he had purchased at a road junction near the western end of the town, close to the principal new housing schemes and opposite the main gate leading into the Castle grounds. It was a mistake in planning, and public disapproval began to make itself felt. The Trust, in an effort to redress the situation, sought to distrain the garage proprietor from extended use of the area. The parties went to law, and the case was fought through the courts until, in the House of Lords, the Trust finally lost and had to pay a bill of some £4,000, equivalent to a fine of £4 to £5 from every family in the burgh. The Trust drew its lesson, and since has formulated a more alert and constructive policy.

The town is well served by its shopping centre, with multiple stores jostling for custom with smaller private business concerns. Prosperity for all, however, depends on the well-being of the Harris Tweed industry. If there are recessions, as there have been in the past, the tills rattle spasmodically. Also standing to suffer are others such as the bus companies (who provide the efficient town services and link up Stornoway with the rural areas), the builders and the haulage contractors. In the ever-present climate of unemployment it is the policy of the mills to employ male labour, despite the fact that women would be cheaper. The mills, run by natives or by Lewis-born incomers of the second and third generation, realise a social obligation in recognising that in Lewis the strong tradition is that the man should be the head of the family in every sense. The mills also carry a proportion of surplus labour to offset the unpredictability of those workers who, with crofts to look after, occasionally have to take a day off 'at the peats' or some such activity. This is another of the island's distinctive traditions.

On Cromwell Street is the shop of James MacKenzie & Sons Limited, dealing in hardware, furniture and china. Nothing unusual in that, at first sight: yet it is another unique aspect of life in Lewis, being conducted as a charity for the benefit of, among others, the aged and infirm persons of Stornoway. The business was established in 1830, on its present site. In 1964, the then principal shareholder presented the building and the business as a

island; but islands in isolation must carry a population of suitable numbers and age structure before they can support even a minimum of amenities. In the Western Isles, Stornoway used to be the only community to have a semblance of the services taken for granted in similar towns on the British mainland. The elements of commerce, industry, education and religion were established there initially, to spread with characteristic slowness first to the immediately accessible areas and then to remoter regions. Though many parts of the island are now at least within practicable travelling distance of the social and public services expected in urban communities, some townships have yet to see one or another of them within their own boundaries.

The Stornoway Gas Light Company was formed in 1840 by Sir James Matheson, with a capital of £350. The plant consisted of one horizontal retort which produced about 1,000,000 cu ft of gas annually. The old buildings still stand, and the plant now has three vertical retorts with an annual production of just over 40,000,000 cu ft. Rural areas use Calor gas, introduced to the island in 1935.

The public electricity supply has of course made the greatest impact on the island as a whole. Electricity was known in the island long before the public supply arrived, generated privately by individuals, hotel concerns or public authorities. One of the first plants of significance was installed in the second municipal building in Stornoway (the first, built in 1905, was destroyed by fire in 1918), and was driven by a gas engine. In 1919 Lord Leverhulme installed an electricity plant in Lews Castle, which also had a private intercommunication system. While this work was being done Leverhulme proposed to give electric lighting to the town. Other buildings with their own plant included the hospitals and the mills, which were turning to electric motors for driving their line shafting, the power take-off for spinning and carding machinery.

In 1929 an electricity supply company, with a capital of £12,000 was proposed, the Stornoway Electric Supply Company being registered in 1932. Its financial fortunes were chequered, though revenue was rising slightly by the time the second world war began. In 1948, on nationalisation of electricity supplies, the

factured goods and foreign produce. There is a Branch office of the National Bank of Scotland, two friendly societies, four inns, and so many as about a score of dram shops.' The annual burgh revenue was £17 3s and the expenditure £15 17s 6d. The town boasted ten streets, a saw mill, a mill for carding wool, a corn mill, a very large malt barn and mill, and an extensive distillery. These buildings were constructed 'in a style not much inferior to the best buildings of their class in Scotland . . . A stranger on arriving at it by any route, or from any quarter, is surprised to see so large and flourishing a place in so remote and uninviting a corner. Its broad field of houses, its capacious bay, and spacious piers, its occasional crowd of shipping, and stir of trade and gaiety, and the vicinity to it of the aristocratic mansion of Seaforth-lodge, render it a striking and very welcome relief to the prevailing dreariness, sterility and inertion of the rude country in which it is nestled.'

In 1901, when the West Highland line was opened, the return fare from Mallaig to Stornoway by MacBrayne's steamers was 14s 6d. One could go from Glasgow to Stornoway by steamer for 31s 6d return. A *Guide* for that year indicated that Stornoway had three hotels, six churches and a Court House, singled out for specific mention for some reason. A Ross-shire *Directory* of 1914 describes the Nicholson Institute as one of the four Junior Student Centres in the county. Its Leaving Certificate results were the best in the north of Scotland, with a total of 95 higher and 234 lower passes, and no less than 20 passes in Higher Science.

Stornoway is a Burgh of Barony, dating from 18 October 1607. It had, of course, been a town of sorts long before the Charter was granted by James VI; the Charter was executed under the Great Seal conveying equal shares to three of the leaders of the Fife Adventurers. Under the Police Act of 1862 Stornoway became a Police Burgh. A bank agent in the town was appointed first Chief Magistrate on 31 December 1863. Under the 1892 Act, the designation 'Town Council' superseded that of 'Burgh Commission' and the Chief Magistrate assumed the title of Provost, the senior and junior magistrates becoming known as senior and junior bailies. The present Municipal Buildings were opened in 1929. The previous building was only an idea in 1897; it took

Hundreds of place names are known to the villagers which are not marked on any map. These place names constitute part of the oral tradition of a population which has lived in a confined geographical area for generations.

In most of Lewis, village and township coincide. The village of Shawbost is composed of two townships, South Shawbost in which the crofts splay outward like a fan from roads which curve over an uneven landscape, and North Shawbost which is composed of linear streets (see Map C), to which the crofts are perpendicular. Each township has its own common grazing land, and its own grazing committee. All of South Shawbost and part of North Shawbost belong to one private estate (which includes other townships to the southwest), and most of North Shawbost belongs to an estate which extends to Barvas. Beyond the fact that non-crofters in South Shawbost have found it easier to acquire crofting status, little difference between the two townships appears to be due to their belonging to different estates. As elsewhere in crofting regions, the landlords of the two estates are concerned mainly with the sporting potential of their land.

The two townships are themselves divided into named neighborhoods (cf. Vallee 1955 for a discussion of "natural neighborhoods" in crofting areas).

000 "natural neighborhoods" in crofting areas). The
363 northernmost street of North Shawbost is called Carnan
103 (carn = a heap of stones), and the street parallel to it, by the loch and the sea, is Baile Stigh ("the town within," i.e., in toward the sea. In everyday speech,
[196] one goes "in" to the sea and "out" to the moor, a reference which probably derives from the days when fishing was extremely important. The sea was then the focus, from which the village expanded "outward." Today the road is the source of goods and transport). Part of the Baile Stigh is sometimes called Gearraidh Buidhe (buidhe means "yellow"; gearraidh is the land from which peat has been stripped). The Baile Stigh intersects the main road and continues toward the moor, where it becomes New Shawbost. New Shawbost, once called New North Shawbost, is also called Pairc, referring to a farm which existed there before the land was turned into crofts.

632 The neighborhood regions of South Shawbost are less easily
363 recognizable as the land is not divided into linear
103 streets. To the people of North Shawbost, South Shawbost is simply Baile Thall, "the town over yonder." (Residents of South Shawbost also refer to North Shawbost as Baile Thall, but also frequently refer to the different streets.) Within South Shawbost, several neighborhoods are distinguished on the basis of the clustering of houses,

632 distinctive geographical features, and nearness to the
363 sea: Ceann a Stigh (or Ceann a Stigh Bhaile, or Baile
103 Stigh, the "town" at the "head" of the road "in" by the sea), Buailebhir (an area identified with the keeping of cattle), Gearraidh Mor, Creagan, Pluic, and Mach a Chul ("out the back," by a road built relatively recently) A street which leaves the main road and cuts into the moor, or common grazing land, is called Grinnbhat, from the name of a nearby loch.

511 The presence of a large Harris Tweed mill in
[348] Shawbost has contributed to a high standard of living
[288] within the village. It is estimated that only 25% of
[493] the households of rural Lewis have cars; about 50% of the households in Shawbost possess them. In 1970
[342] Shawbost had only one occupied tigh dubh, or "black house" built of dry stone and roofed with thatch, which to many islanders symbolizes a past life of poverty and
[404] adverse times. Modern appliances such as refrigerators,
[251] deep freezers and electric toasters are common in
[207] Shawbost. Most homes also have television sets, and
[206] many have telephones.

288 The mill in Shawbost employs between 60 and 70
463 persons to dye, card and spin yarn, to prepare the yarn in warps which are then delivered to weavers who work in their own homes, and to darn, wash and market the

In 1901, when the West Highland line was opened, the return fare from Mallaig to Stornoway by MacBrayne's steamers was 14s 6d. One could go from Glasgow to Stornoway by steamer for 31s 6d return. A *Guide* for that year indicated that Stornoway had three hotels, six churches and a Court House, singled out for specific mention for some reason. A Ross-shire *Directory* of 1914 describes the Nicholson Institute as one of the four Junior Student Centres in the county. Its Leaving Certificate results were the best in the north of Scotland, with a total of 95 higher and 234 lower passes, and no less than 20 passes in Higher Science.

Stornoway is a Burgh of Barony, dating from 18 October 1607. It had, of course, been a town of sorts long before the Charter was granted by James VI; the Charter was executed under the Great Seal conveying equal shares to three of the leaders of the Fife Adventurers. Under the Police Act of 1862 Stornoway became a Police Burgh. A bank agent in the town was appointed first Chief Magistrate on 31 December 1863. Under the 1892 Act, the designation 'Town Council' superseded that of 'Burgh Commission' and the Chief Magistrate assumed the title of Provost, the senior and junior magistrates becoming known as senior and junior bailies. The present Municipal Buildings were opened in 1929. The previous building was only an idea in 1897; it took

121 being determined by conditions of culture, such as
121 political and economic conditions. Under conditions
178 of gradual centralization of economic and political
182 systems, the geographically marginal crofting areas
have evolved strategies, some of which puzzle agencies
concerned with development or other aspects of
governmental process.

178 Before the North of Scotland Hydro-Electric Board
• 365 began to operate in the crofting counties, not more
511 than one croft in every hundred had electricity; but
by the end of 1951, one in every six holdings had been
supplied (Taylor 1954: 20). "The light" came to
[354] Shawbost in 1951. Before then, the islanders used
[179] Tilley lamps, a Canadian invention; and before then,
[312] double-wick paraffin lamps. Piped water came a few
[164] years later, around 1955; it was brought from a nearby
loch, and the construction work gave temporary jobs to
[44] local people. The availability of these services
[12] facilitated the building of county council houses,
which many welcomed as providing a relief to the
congestion caused in part by rules against building
more than one house on a croft. But, paradoxically,
[1] with larger, better homes and all these services came
a decrease in the advantages of living in a crofting
township: property was assessed and people began paying
rates or taxes.

522 181 In nation-wide comic strips and jokes, the Highlander plays the role of the clown, the rustic country cousin. The comic strip "Angus Og" portrays a kilted Highlander, sly and canny behind his apparent simplicity, tricking the landlord and searching for the Loch Ness monster. Stories of the lazy, dour crofter abound.[1]

166 181 When young men go away to the Army or Navy or to work on the mainland, they say that they feel like "foreigners." "Thirty years ago the island was very isolated. It was difficult to get away. There were so few education grants available. I got my teaching certificate and wanted to get a post back on the island, but was told there wouldn't be a vacancy for another fifteen years. So I went down to England, and found I had to be at least as good as an Englishman if not better in my job to get ahead."

175 166 182 871

177 365 354 "When I went into the RAF, I had never seen light switches because we used paraffin lamps. An English chap told me to turn the light on, and I didn't know which way meant on or off. That memory still sticks in me."

---

[1]Even a high official in the Highlands and Islands Development Board tells a joke, that is "presently going round Westminster," of the Spaniard who approached the Highlander and told him of the word mañana which he translated as "Don't do today what you can put off till tomorrow," asking if there was a corresponding word in Gaelic. "In Gaelic," replied the Highlander, "we have no word that conveys such a sense of urgency."

company gave way to the North of Scotland Hydro-Electric Board. In that year there were 1,063 consumers, all within the Stornoway burgh boundaries. With its social remit, the board started on bringing power to rural areas, even where uneconomic. Lighting in the crofting townships was mostly by oil lamps, mainly the hot-mantle type (the 'Tilley'), but by 1960 the number of electricity consumers had reached 8,124, and the present number is about 96 per cent of the potential. Harris received its supply in 1954. The generating station is at Stornoway and employs diesel-engined units as prime movers, with an annual output of some 22,000,000 units. In August 1960 the Gisla scheme came into operation, the island's first hydro-electric plant; designed to produce some 2,000,000 units annually, it harnesses the waters of the Gisla River, which flows out of Loch Grunnabhat in the parish of Uig, Lewis. The station has a capacity of 540 kW. The other hydro-electric scheme is at Loch Chliostair in North Harris, planned to produce about 2,400,000 units annually.

The provision of water and drainage is still on the drawing boards for a number of crofting townships, though work is progressing for others. The Uig water scheme has cost some £100,000, a relatively large sum for a small population and amplified by similar work for drainage schemes. This scale of public expenditure must continue if people are to stay in their native villages and not migrate to Stornoway or leave the island altogether. Stornoway's new water scheme has cost something in the region of £160,000, but is vital if the town hopes to attract industry. The original burgh water supply was started in 1846 by Sir James Matheson and a few businessmen. The capital of the Stornoway Water Company was only £800, but it gave the town a gravity-feed supply from the nearby Loch Aridh na Lic long before many larger places on the mainland had considered such projects. Heavy floodstorms destroyed the old dam in 1933, and a new waterworks at Loch Mor a Starr was opened in 1937. As Stornoway extended the old loch had outlived its usefulness; for many years there had been difficulty in getting water to the higher parts of the town, particularly during the heavy fishing seasons when the fishermen drew off large quantities.

An effort has been made to separate crofting from other income, and also to average the income from the sources given of the total rural households, numbering 4700, composed of those on the 3650 *occupied* crofts plus an estimated 1050 others, namely, cottars and squatters, and 'feuars'—*i.e.* holding land in feu.

Finally, to the productive income earned on the Island there should be added that received by earnings sent or brought home to dependants, together with pensions, unemployment relief and the like. I am greatly indebted to the appropriate officials for the figures cited for 1937–38 or the year immediately preceding. These sources average £45 per rural household. The figures tabled all apply to Lewis alone; but many figures having been obtained for Harris also, conclusions are similar there. The concluding Table (pp. 314-315) bears a note on other sources of income, with a similar table for 1953.

(i) *Tweed Industry*

After deducting the cost of wool imported from the mainland and certain other costs, the net productive income was taken to be £307,000. The estimate may still err on the high side but it indicates the prime importance of the industry in the Lews. For 1938 the quantity of tweed stamped, and certified as hand-woven by the Harris Tweed Association Ltd., was 2,830,900 imperial yards, rising in 1939 and 1940 to 4,000,000 yards, though falling thereafter. The value of the tweed produced in 1938 was approximately £500,000. The total wages paid in 1938 amounted to £140,000 (£139,600), rather more than half of which was paid to the weavers working at home. In 1940 this had risen to nearly £200,000, a slightly higher proportion falling to the weavers.

In addition to the wages paid and the price paid for local wool, the industry is a valuable customer of the Electricity Company and directly or indirectly provides much other employment in the Island. The industry also provided a market for a large quantity of Scottish wool and contributed to taxation.

The productivity and earnings of the industry continued to

CHAPTER EIGHT

LITTLE LOCH ROAG DISTRICT

(Meavaig, Caryshader, Ungshader, Geshader, Enaclete and Gisla).

by

Annie Heawood.

133 Little Loch Roag is a narrow sea loch extending southwards about twelve miles inland
[131] from Loch Roag proper. It has been formed by glacial erosion picking out one of the
n.n.e. to s.s.w. lines of weakness characteristic of the Lewisian gneiss. Although
[134] generally steep-sided, recent glaciation left much ground moraine and this material, best
preserved on the less steep slopes, provides arable land for several small townships on
or near its western shores. The eastern shore is the more rugged and although a few
small townships once existed there is now only the small farm and shooting lodge of
Scaliscro. At the head of the loch is an estate cottage for Moregail Lodge which is a
large mansion with extensive fishing and shooting rights, grandly isolated about a mile
inland from the main road.

361 The district here described includes Gisla, near the head of Little Loch Roag, Enaclete,
[32] Ungshader, and Geshader, on the western shores of Loch Roag proper. All these are
strung out on or close to the main road. Meavaig, like Gisla, is a small farm but also
365 functions as something of a metropolis for south Uig; it has the post-master, whose other
functions include registrar and receiver of wrecks it has two churches, a telephone ex-
change, the district doctor and manse, and a petrol pump. At the time of our visit it
was also the base for the 'bus service. Its metropolitan functions arose in the days before
the road replaced a ferry boat service from Callanish; here the mails were landed until
some date in the 1920s, and here, too, the estate kept coach and horses for transport to
Uig lodge, three miles further west.

361 There is no record of the original settlement of the four crofting townships, nor of
365 Gisla, which was a township (or 'joint farm') of five crofters until about 1850. Some
modern houses and bungalows have been built, many with easier access to the road than
[32] the old black houses, now often used as byres. Water supply does not seem to present a
serious problem because of the extensive moorland gathering grounds to the west, but there
are not at present any water-supply schemes. Electricity is, of course, available.
Caryshader and Enaclete are on the main Stornoway road being served at present by the
'bus and by vans selling meat, groceries and fish at least once a week. Enaclete has a
sub-post-office. Geshader is less fortunate since, although vans call regularly, 'buses
must be met at the junction of the unsurfaced track and the main Stornoway road, where
the school serving this district also stands. The track has been extended in recent years
so that it now reaches all the houses. Ungshader, however, is smaller and although it
has had similar delivery arrangements, it is now a dying settlement largely due to its
inaccessibility.

427 The crofts are mostly regular in shape on the landward side and fenced except where
the land is very broken as in northern Enaclete. In Caryshader there are fourteen legal
632 crofts which at present are worked as eleven units; one is used only as a holiday home
by its owner-occupier and there is one squatter on the common grazing. In Geshader
311 there are eleven crofts, each worked independantly; Ungshader has four crofts but the

101 more recent to the west, and in the industrial area of the
161 Great Glen the trend is reversing itself. To the north and
162 south depopulation has been more serious. To the east the
general trend has been similar to that of Skye. We need not
be troubled by statistics at this time, but for convenience
[178] the population figures are given in Table 1. The Outer Hebrides
have preserved more of the social aspect of the old culture
than the Skye people while the Mainlander has felt the effects
of the processes of acculturation with more obvious results
than the people of Skye. In short, the Highlands are not
a homogeneous region. They represent a great diversity of
conditions.

101 My information on the contemporary culture of the Isle
115 of Skye was provided by the residents of three communities,
the villagers of Portree and the crofters of Glendale and
101 Kilmuir. Portree is a small nucleated village with a popu-
621 lation of a thousand. It is important to the study because
[348] in many ways it represents an alien way of life. Here are
found the county and national government offices, staffed
mainly by newcomers to Skye, which serve the whole island.
[344] Here too, are the grocery, drug, clothing, and hardware
stores which depend on the people of at least, northern Skye
[346] for a large part of their trade. There are a number of
craftsmen who are equally dependent on the rural population.
For the most part, the members of both groups are newcomers
[348] from the Lowlands or elsewhere in the Highlands. As the
[343] terminus for the mail steamer which links Skye with the mainland
and the hub of the daily bus service which connects the rural

TORNOWAY

oing concern to a trust which was set up to receive the gift and hose first object is to assist aged and infirm residents in the urgh. In effect, all profits earned by the shop are passed to the rust for distribution to those in need.

Almost half the houses in Stornoway were built by the local uthority. The Town Council has never been afraid of rooting ut unfit houses. By 1937, under the 1930 Slum Clearance Act, ne person in four in the town lived in a council house. The hous- g schemes, though large, have still that element of community ith personality, something often lacking in newly developed reas of other towns and cities. The Council also supports private ousing by taking up sites, clearing and servicing them and then euing them to private owners. The rents policy is to have no hous- g deficit beyond the statutory rate contribution (which works ut at between £6,000 and £7,000 per annum). The Council's enants co-operate with rent collection to a unique degree: col- ction figures are something like 99 per cent and on occasion 100 er cent. A vigorous housing policy is important to the town, as s population is now over 5,300 and still growing, mainly at the xpense of the rural areas. Development plans at present envisage 1981 population of about 9,100 persons within the parish oundary and including the burgh.

Stornoway is an island town and is an island's town: s rhythms of life are those of the island, regular and timed by ature, but with an added syncopation—the result of an urban utlook. In this context, Gaelic is the language, though English is e lingua franca. Deeper still in the methods used for communica- on is a kind of patois based on Gaelicised English, Anglicised aelic, with some other words that defy investigation into their rigin. Many words find their natural forebears in Scots, Ameri- an and the maritime tongues of Europe, which might be ex- ected in view of Stornoway's importance as a sea-port of gnificance a century or two ago. The Stornoway language, as oken by true-born natives, recognisable anywhere by another ative, reflects the life of the cosmopolitan, sea-faring people.

Apart from its industrial opportunities, Stornoway has many f the more sophisticated urban facilities that people everywhere em to crave, particularly with regard to education. The senior

A HARRIS VIGNETTE

has direct or indirect communication with Glasgow, Stornoway and North Uist. In summer a thrice-daily bus runs to Stornoway, and once a day a bus makes the round trip of East and West Harris. The township, linear in pattern, east to west, includes sixteen shops which cater for most of the needs of the population within reasonable travelling distance; it also has two cafés, a post office, a licensed hotel, a hall for social functions, a masonic hall and two churches. The Sir E. Scott School here is the only secondary school in Harris with an academic stream. Most of the working population is employed in the service industries, the professions and the tweed industry. Tarbert was a fishing port of some significance in the past, and is now a refuelling point for ships.

The absence of organised industry on a large scale, such as Lewis has, is a factor which tends to bring nearer to reality any desire on the part of Harris natives to leave their native soil. There are small pockets of industry, but these are only dabs of easing ointment on the excessive unemployment sore of 27 per cent. The main occupation is of course crofting, the income from it being augmented from a variety of sources. Some crofters concentrate on the production of Harris Tweed, perhaps using the wool from their own sheep; the natural dyes from the lichens which grow on the rocks and from other plants are still used occasionally. Others specialise in knitwear. Recently shell-craft and wood-turning have been added to the traditional crafts, with a view to the tourist market. Fishing, of course, plays a part in the economy in some communities. The interest of such organisations as the Scottish Country Industries Development Trust has been concentrated on the potential in shell-fish processing, and the production of knitwear on a larger scale than exists at present. Roadwork gives employment to about thirty men, but is of course seasonal.

An apparently bright light on the employment horizon showed itself in 1965, with the opening of a quarry at Lingerbay. The mineral quarried was anorthosite, a white granite used as an abrasive in cleaning products. A 99-year lease was taken out by a subsidiary company of William Robertson (Shipowners) Limited, Glasgow. But the quarry was closed in 1967 due to lack of orders.

175 361 162 226 of Ross and Cromarty, with populations of from 1000 to 2300 in 1841, Stornoway leapt ahead by 1851, growing with the rise of the fishing trade. Including the literally floating population of fishers, its numbers exceeded 4000 in the summer of 1921, though falling below this in 1931 when the census was held in the spring.

175 278 361 Still another stage, a fourth, seemed in sight when, in 1918, the first Lord Leverhulme made his bid to centralise the scattered, failing fishing industry of the Island at Stornoway. A canning factory was started (south of the area shown on the plan), only to be dismantled before its completion, then recommenced and again dismantled at "Leverburgh", South Harris. New housing commenced. When this great venture closed and population stagnated, the grandiose proposal to reopen the diagonal vista on Wood's plan and centre it on some great new building, remained a dream. The failure of Leverhulme's great enterprise and its hopes led to discouragement for some years. Yet it is possible that the vision of change given to the Island may have contributed to a renewed capacity for enterprise, individual and communal.

175 361 [288] Later extension had to await the growth of the Harris tweed industry, and the erection of spinning-mills to provide yarn for the rural hand-weavers. The town has extended beyond the plan in two main directions: to north-east with villas and housing schemes and to ESE. with the great new mills where kippering sheds were numerous from the mid-nineteenth century until after 1919.

361 366 [162] Although Tarbert is a shopping centre for Harris and has its spinning-mill, Stornoway has no rival on the Island. The adequate depth of its harbour, combined with its position and access from sea and land, have given

361 366 162 it command and make it the leading settlement of the Hebrides, with a population fluctuating around 5000.[1]

2. *Aspects and Problems of the Burgh*

361 632 The little town pleases by its views over the harbours, outer or inner—sheltering perhaps a steamer or two and the clustered fishing vessels—across to the wooded skyline and the beautiful grounds of the Castle, a-flower in spring with rhododendrons. Or framed in trees from the Castle policies, the harbour and even the roofs and [342] smoke of the houses are not unpleasing (Plate II). But the town's chief charm is its setting, not itself, though its plain dwellings with 'harled' or rough-cast walls and slate [246] roofs are simple and inoffensive. In rehousing, the Local Authority had respected Scottish domestic features. But [656] the greater use of local materials, labour and skill is surely desirable in the Island with its many half-employed men, who need such work to maintain income, health and morale. [362] As is to be expected in view of low incomes, and the extremely primitive housing in the country, urban housing [162] is inadequate. In Stornoway burgh in 1931, 44 per cent, or nearly half the population, still dwelt in houses of one to three rooms, 17 per cent in four (including attics often with no dormer windows), 20 per cent in five or six, and 18 per cent in seven rooms and over. There has been improvement up to 1939, and after 1945, but much remains to be done.

369 632 Turning to cultural life, profound differences divide the town from the country about it. Whereas in the townships of rural Lewis the people are almost purely natives

[1] The burghal area was extended in 1935. At the census of 1951 its population stood at 4950. This showed an increase of 15·9 per cent above the population enumerated in the same area in 1931.

491 [494] Brenish, at the end of the tarred road which also serves Islivig, is forty miles from Stornoway. On the thrice weekly bus the return fare to Stornoway was £1, and freight cost half-a-crown for a hundredweight, but because of competition from privately owned vans the bus service ceased in 1960. Mangersta is reached from the same road by about a mile of untarred side-road of indifferent quality; formerly the only access to it was by [366] a footpath over the sands to the south. General merchandise, fish and meat are supplied [226] by weekly vans; there are no shops. There is a post-office at Islivig; banking facilitie [753] are supplied by a mobile bank.

311 427 The majority of the crofts are long narrow strips, with those in Mangersta being some what more compact. The area ranges from two to nine acres, with an average of about four acres; in Brenish and Islivick only about half is usually arable. All the crofts - or croft-units - are fenced, the work having been completed in Brenish in 1959. There are twenty-nine crofts in the rental for Brenish, ten for Islivick and thirteen for Mangersta; but, owing to amalgamations of various kinds the number of operative units is considerabl less - fourteen in Brenish, five in Islivick and ten in Mangersta. There are no cottars.

134 401 [231] As soils are reasonably good and comparatively free from rocky outcrops, the arable patches are large enough to be cultivated with a horse or tractor. There is a tractor in Brenish, and four horses, a horse in Mangersta and two in Islivick. All of these are hired for ploughing and carting peats. Very little work is done with the spade, unlike many of the other Uig townships.

233 While the general rhythm of township work through the year is similar to other areas, here the sheep are wintered up on the hills; some crofters winter lambs on their crofts. Brenish crofters are allowed to winter eight sheep, (or sixteen hoggs, or four year-old heifers), on Mealasta Island - hoggs are usually sent since their loss, by falling over the cliffs, is less serious than the loss of heifers. Eilean Molach is used by Mangersta crofters, who are allowed two sheep each in summer.

241 The only crops grown are potatoes and oats, with "black oats" (Avena strigosa) on the sandy soils in Mangersta. Since seed for "black oats" is unobtainable commercially, the crofters save their own. A grass mixture is sown by the majority of crofters for hay to qualify for the subsidy.

233 The extensive hill and mountain pastures are not separately fenced; sheep from all three townships graze over all. If the total sheep stock of the townships (about 3,300) is compared with the souming figures it is found to exceed the soum by about 50%. On the other hand, fewer cattle and horses are kept than formerly so that taking the total stock for all animals (horses, cattle and sheep) and comparing with the actual stock now carrie the area carries only 87% of the stock which the soum allowed. In the two older township the souming was reckoned according to rent, being one cow, one two-year old and eight sheep for each £1. In Mangersta, however, the soum was one horse, three cows, one heifer, two stirke and twenty-five sheep for each croft.

[226] [435] Lambing percentage is about 80, and ewes form about 60% of the total sheep numbers (excluding lambs). In this district some wedders are kept for three years and then sold for meat, but the main income is from wool, about three pounds weight from each sheep, which sells at up to four shillings a pound.

231 Most crofters keep one or two cows, and the calves are normally sold in the autumn or spring sales. Brenish and Mangersta each have a bull, and in the three townships the are sixty-seven cattle and thirty calves. Shielings, formerly used for about seven weeks

361 Many of the original houses are ruined or used as byres. Figure 14 shows that new
491 houses have been built near the sites of the old ones but sometimes nearer the road - all
487 but four houses have easy access to the road. Crowlista is linked to the main road by
492 two miles of rough gravel side-road, and by a footpath and ford via Timsgarry. Vans call
365 but there is no Post Office, store nor bus service. At present water supplies are poor -
366 two wells only are in use.
[492]
[312]

Carnish is served by a short unmetalled road and all houses have good access to this. Water supply is good; water may be stored on the high part of the crofts and piped into the houses. The roads serving Timsgarry too, are unmetalled, but the main road is less than a mile away. This 'main road' from western Uig to Stornoway runs through Ardroil and all except one of the houses not near to it have good drives suitable for lorries. Ardroil has a store and Timsgarry a Post Office. One butcher's and two grocers' vans call weekly and the travelling bank fortnightly. The thrice-weekly bus service to Stornoway (return fare almost £1) ceased in 1960 because of competition from privately owned vans and cars.
[368]
[325]
[453]
[491]

The cultivated land is in strips usually large enough for horse or tractor work; the smaller potato patches are hand dug. Few horses are kept now, Timsgarry, Ardroil, and Carnish have one each and Crowlista none. Crofters hire these horses or tractors from Brenish or Enaclete. Oats and potatoes are the only crops grown in quantity, small patches of turnips are found and most crofters grow root vegetables. Kale was seen growing on one Ardroil croft; this was an experiment and seemed to be very successful. Bere and rye are no longer grown. Grass mixtures are sown in order to qualify for cultivation grants. Oats are undersown, or grass seed may be sown after the oat harvest, and left for hay for several years - some sown twelve years age was said still to be giving very good hay, but on the whole very little grass is sown in Crowlista. The acreage of natural grass cut for hay varies a good deal with the weather and the time and labour available. Crofters find this difficult to estimate as well, as often small irregularly shaped pieces are cut, and the figures, therefore, may not be accurate. (Appendix A).
241
231
[401]

One excellent garden showed that a rich variety of vegetables, fruit and flowers can be grown if adequate shelter is provided and the time for cultivation is available, but few crofters have the necessary knowledge or interest.

Lime, dung and artificial manure are widely used, though on some Crowlista crofts the compound fertilisers were in use for the first time in 1959. Shell sand is used on the crofts which have peaty soil. Although it is agreed that seaweed and dung are the ideal fertilisers for potatoes, seaweed is only occasionally used. It is becoming difficult to obtain locally and much heavy work is involved.
242
134
224

Each of the thirty-five operative units which carry any stock at all has a cow for domestic milk supply and manure. If the family is large or many visiting relations stay on the croft during the summer the calf has to be sold early; otherwise it will be reared until the cattle sales in September or May. Only eight crofters had two cows; fifty years ago four were commonly kept. Only thirteen of the units had young cattle other than calves. One crofter was rearing a kid for milk.
231

The bull supplied for these townships and Mangersta is an Aberdeen Angus which is wintered on the Ardroil machair.

It was sometimes difficult to obtain factual information about sheep and it is difficult to generalise. Operative units without sheep were those where no suitable labour was available. In a few cases crofters considered that sheep were 'not worth the trouble' - but others were building up their sheep stocks. Individual flocks ranged from ten to two
233

427 authority, simply moved their fences and enclosed part of the common grazing. For
311 example the crofter at 37, instead of having only the 6.7 acres of the croft has now almost
10 acres of land, of which the remaining 3 acres have been 'acquired' by enclosing part of
195 the adjacent common pasture. Some of the crofts are in two or three pieces, and in some
cases this came about in the late nineteenth century when the proprietor's wife, Lady
311 Matheson objected to the position of some of the croft houses because they were too close
to the standing stones. Croft houses 25 and 26, then near the stones, were moved to the
427 other side of the village and given parts of crofts 1 and 2 for their houses. Crofts 1 and
2 were given parts of crofts 25 and 26 as compensation for the parts of their crofts they had lost. Croft 27 also lost part of its croftland close to the stones so that an enclosure could be made around the stones. About the same period, before the passing of the Crofter's Act (1886), when the village was still 'ruled' by the township constable, and several other changes took place. Croft 27 and 28 used to be where the croft houses are at present and the surrounding adjacent area only; but it is said that the tenants of these two houses, being influential with the constable, obtained part of Callanish Farm. Similarly the tenants of crofts 30, 31 and 35 divided part of croft 19; these changes have become permanent. The most recently formed croft was taken from the common pasture in 1890. Since then three feus have been created, but two of these are holiday houses and the third has only 0.5 acres of land.

241 There are 36 working croft units with a total of 134.4 acres reputed arable. All but
4 croft units grow oats, and there are 20 acres under oats (appendix C). Of the
remaining cultivated land 9 acres are potatoes and 5 acres sown hay. Most of the
land is cultivated by tractor; there are 6 tractors in the township. In the past there were several horses but now there is only one. Five crofters still cultivate by spade. The crops are sown in April, and the hay is usually harvested in August and the oats a month later according to the weather.

231 Thirty-one cows, six heifers and 25 calves are kept in the township and tethered most
of the year on the crofts. It is usual for the crofters without a cow to graze one of their
neighbour's cows for part of the year in exchange for milk. There is a beef-type shorthorn bull belonging to the Department of Agriculture, which is kept on Callanish Farm.

233 The 5,302 acres of common pasture support an individually owned stock of 904 sheep
311 and 561 lambs. Several crofters exceed their souming, but there is no shortage of
grazing. Some of the sheep graze on Garynahine township pasture. Callanish also has
the use of the pasture on Orasay island; each year some of the sheep (one sheep or ram
221 per croft) are taken across by boat for a period. The breeding ewes are brought in for
233 tupping on November 14th, after the harvest is complete, and lambing takes place in
April. The crofters open their gates for winter grazing from November 1st to May 10th; in addition Callanish Farm (which has no sheep) is open for winter grazing. The sheep are sheared in July, and the lambs are taken from the ewes a month later. The lambs are dipped in November and the other sheep in December. Shielings at Flodavat are known to have been in use until 1921.

Communications are quite good; the village is close to a main road to Stornoway, and
491 there are four buses a day. But within the village itself many of the so-called roads are
131 merely rough tracks, and one croft, number 29, is inaccessible by motor vehicle; it is
over a mile from the nearest track, separated from it by rough peat land. This year a
[144] grant from the council was made towards the cost of construction of a road to this croft; but several of the Callanish crofters who cut peat on the intervening land refused to allow a road to be built; and so croft 29 is still almost cut off from the rest of the village.
There are two shops in Callanish (one with a petrol pump); grocery, butchers' and fish
131 vans deliver frequently. Callanish also has a stone jetty which in the past was important.
There was a ferry for mail and passengers from here across to Uig and Bernera calling
[344] at Linshader, which gradually declined in importance until the 1920s when it ceased to
[504] call at Linshader. The ferry to Bernera finally ceased in 1940 when the ferryman (who
[505] lived at Callanish Farm) left for war service. After this the jetty was still used by small private boats (e.g. Callanish church serves Linshader, and many people came to church by boat until recently), but gradually it has fallen into disuse.

[Cromore]

The crofters sowed
241 clover with their oats in 1957; the quality of most of the natural grass could be improved considerably
311 by extending this practice. Several of the crofters have taken advantage of the facilities for obtaining
246 lime and fertilisers, but seaweed and byre manure are widely used. Only seven crofts have
249 vegetable plots this year but that of No. 23, (partially enclosed by a dry-stone wall) has produced
224 crops of lettuce, cabbage, turnips and carrots.

221 The souming for Cromore is one cow, one heifer and eight sheep per £1 rental, but is not
231 enforced. The crofters keep the stock which they can manage to maintain throught the winter and
233 no one appeared to be dissatisfied with this arrangement. In fact the souming is exceeded by only seven crofters and the total stock for the township is only 75 per cent of the soum. Lambing takes place in April and May and often a high proportion of ewes and lambs is lost. The sheep are
[136] clipped in July and each crofter usually clips his own sheep. He either sells the fleece or has it spun in Stornoway before weaving it himself. The lambs are taken from the ewes during the second week of August and then dipped; November is the tupping period and almost every crofter had his own ram. Most crofts have a cow and a calf and the crofters like the calves to be born in March so that they are six months old in October for the Garyvard sales. The cows are served by an Aberdeen-Angus bull from Crobeg Farm. The township gates are opened in October and the cattle remain within the bounds until May. An interesting regulation enforced by the Grazings Committee is that each family can have only one dog, and that it cannot be taken on to the Common grazing without special permission, or on fank days.

178 Shielings, situated on the common grazing between Calbost and Cromore, were used until
253 the 1890's. Active land use has gradually declined; in the 1920's, much of the outrun was under
311 cultivation and from an an air photograph, it is evident that hay was being taken on the strips
[242] above Cromore in 1946. The present trend is a continuing decrease in the amount of arable land but this year ten crofters formed a group to enclose and improve a ten-acre plot on the common grazing;
[346] it is unfortunate that all crofters are not willing to take part. Peats are now being cut near the road between Caversta and Gravir, about three miles south- south-east of Cromore and one mile north of Gravir.

17 Cromore was once a prosperous fishing village but now it has no fishing boats. Two Cromore
129 fishermen work on other boats (one from Marivig and one from Stornoway) and there are a few men who would welcome the opportunity to start fishing again. There seem little prospect of this,
[506] however. The landing-stage, completed in 1957, is regarded by many as a 'white elephant' and, in fact, at low tide it is useless. So much for the hopes that it might have been used by cargo vessels bringing goods to Park.

288 In Cromore there are fourteen looms for the weaving of Harris Tweed. Tweeds are obtained by
[493] road from two mills in Stornoway and one in Airidhvruach. At present the average production is only one tweed per loom per week but the weavers could quite easily double their production. During
[126] the past two years this industry has been comparatively prosperous. Knitting is a winter pastime but only for pleasure, although one household possesses a knitting machine.

162 In common with the rest of Park, Cromore has a high proportion of old people. Many from the
166 middle age groups have sought employment on the mainland, and the teenagers, many of whom have
175 been at school in Stornoway, seek jobs there or on the mainland, returning for holidays and assisting
164 with the croft work. Some younger folk are resident to care of aged parents.

491 Cromore is only eight miles by sea from Stornoway yet all communications with the town are by
[491] road - a distance of thirty-two miles. There is a daily bus service and the sub-postmaster has a van
[491] which is occasionally hired. Some people recalled that the only route to Stornoway was once by boat to Crossbost and thence by bus. One resident owns a lorry and this is used for most of the haulage in Cromore, particularly for bringing home peats during the summer. As a result of recent additions to the roads, only three crofts remain inaccessible to vehicular traffic. There are no
166 shops in Cromore but grocery vans call on Monday, Tuesday, Wednesday, Thursday and Saturday;

[Cromore] [Marivig]

butchers' vans call on Wednesday and Friday and a fish van once or twice during the week. Goods are also conveyed by the daily bus. Electricity was brought to the village about four years ago and the inhabitants now look forward to a supply of piped water in about two years' time. At present only three or four houses have bathrooms.

The crofts, when worked well, are good enough to provide the existing population with a satisfactory subsistence, but each family unit must have some additional source of income. It seems that the recent subsidies for fishing are good enough to attract fishermen from Cromore and one or two boats might be sent out from the bay if the quay were longer. Weaving has brought prosperity but, as the Park Association states in its Second Progress Report "there is not sufficient weaving available for the present number of weavers". The proposal to establish a spinning and processing plant in the Park District made in the 1957 Report, would undoubtedly be of great value to the people of Cromore. The village is sited in a most picturesque spot and one of the inhabitants suggested that a hotel built on Crobeg Farm would bring some benefit to the community. However, even if these three increased sources of income became effective, one wonders whether they would be sufficient to attract the younger generation, already urbanised by schooldays spent in Stornoway.

MARIVIG

Pamela Gough, B. A.

Marivig is situated on the western and south-eastern sides of Loch Marivig, a small triangular sea loch opening to the north-east and sheltered from storms and swells by Torray Island, making the loch an ideal anchorage and harbour.

The land rises steeply from the shore of the loch for twenty-five feet to fifty feet, then slopes more gradually and irregularly, with frequent precipitous rock outcrops, for two hundred to five hundred yards to rise steeply to a line of low hills, two hundred and fifty feet to three hundred feet high, surrounding the loch. All crofts thus have an easterly or north-easterly aspect, not particularly favourable for agriculture, and only one has any appreciable area of level land uninterrupted by rock outcrops. Soils, derived from glacial drift, are unevenly distributed, thin, and very stony, and cultivable areas are thus small and widely dispersed.

The surrounding hills, which form part of the eight hundred and sixty-three acres of common grazing, are mainly covered with heather, moor grass or sphagnum bog, while the lower areas within the township are grassy, but drainage is poor, and rushes are widespread. Bracken is not yet a problem, and only small areas exist, mainly on the lower slopes of the western side of the loch. A few rowans and willows survive here also, but otherwise the area is devoid of cover.

There are twenty-four registered crofts in Marivig, twenty-two being inhabited, one vacant and worked by another crofter, and one worked from a house on the common. With the exception of two crofts, one of which is on the common, all the boundaries run from the township dyke, which closely follows the two hundred foot contour, to the sea in radial fashion (Fig. 4). The size of the crofts varies from 1.25 acres to 22.25 acres but only seven crofts and less than four or more than eight acres in size. No croft has more than three acres of land which has ever been cultivated, and few now cultivate more than one acre. There are thirteen cottars and squatters, five houses being on the common, three of them cultivating small areas adjacent to their houses.

Cultivation is exclusively by spade on the 'lazy-bed' system. Owing to the rocky nature of the terrain, the 'lazy-beds' are narrow, often only one or two yards wide. Potatoes and oats are grown in rotation, and hay taken from lazy beds left fallow. Very few crofters sow grass for hay or undersow their crops. Dung and seaweed are used as fertilisers, with potato fertiliser as the most general 'artificial'. Small enclosed gardens, often somewhat neglected, produce lettuce, carrots, cabbage and soft fruits on about half the crofts, but no garden produce is marketed.

[Marivig]

231 There are only fifteen cows, two yearlings and four calves in the township, and the crofters with no cow rely on neighbours, or on tins, for their milk supply. All but two of the crofters keep sheep, there being four hundred and eleven ewes, one hundred and eighty-five sheep and two hundred and thirty-four lambs belonging to the township. The common grazing (including the off-shore islands which are grazed by five different crofters each year) is used for the sheep in summer, while [235] all but one of the crofters winter their sheep within the township dyke on the crofts. Most crofters keep hens, and surplus eggs are sold to the Stornoway vans.

314 Peats cut on the common are transported by lorry to the crofts, while peats from the north end of 482 the peninsula separating Loch Marivig from the sea must be carried in creels.

228 Nearly every crofter owns a rowing dinghy which is moored in the loch off the end of his croft, 501 and with this supplements the family food supply. One herring boat, operating nightly from Stornoway and returning to Marivig at weekends, is all that is left of a fairly large fleet which operated before the war. A second boat, unused for two years, lies shored up on the beach, and two others are wrecks. Over fifty years ago there was a curing station at Marivig. One crofter fishes lobsters during the winter and markets them in London.

163 Of the other crofters, only two supplement their incomes by weaving, one by working on the 166 roads while several men work partly on the crofts but are periodically away whaling in South Georgia, fishing, or on hydro-electric schemes. Several others are in the Merchant Navy. The gradual 166 migration from Marivig, especially of the young people, is reflected in the high average age of the 167 permanent residents, and in the numbers in the school -over one hundred pupils in 1900, thirty-nine 162 (including sixteen from Calbost) in 1946; but only nine (none from Calbost) in 1958. The young 171 people leave the township to train or work on the mainland (generally in Glasgow) or in Stornoway, while their elders accept the view that "there is nothing for the young people here".

205 The township has a Post Office and telephone kiosk which also serve Calbost, while lack of a 206 shop is partially compensated by a choice of four vans from Stornoway and one from Gravir. There 366 is a daily bus from Gravir via Marivig to Stornoway and back: the return is over 10/-. The road 390 which reached the township from the west in the late 1920's has a tarred surface and is much 458 better than the later road southwards to Gravir which is untarred. There is no church in Marivig 491 and most of the population attend the Free Church in Gravir.
446

363 Within the township the two arms of the township road serve all but two of the crofts and the 361 sites of the newer houses, few of them more than thirty years old, tend to be near the road, while 342 the ruined houses found on most crofts are often nearer the sea. Only two thatched houses remain 377 and the other inhabited houses are built of stone roofed with asbestos slate, or of corrugated iron. 312 All the crofts are supplied with electricity from the grid, but very few have a piped water supply; rainwater is collected from the roofs and piped for washing, with a separate piped supply from a well for drinking. All other houses draw water from wells.

829 The stormy winter weather, rocky terrain and poor soil are all blamed by the residents for the drift of population away from the crofts, but those who remain have little incentive to work the 200 crofts more efficiently owing to the very hard labour involved. It is suggested that with more intensive cropping and more cattle, each croft could make a comfortable profit and surplus milk, potatoes and eggs could be marketed in Stornoway - the milk replacing that at present brought from the mainland. Such development, perhaps on a co-operative basis, together with a revival of the fishing industry and introduction of a tourist industry, by building a small hotel or guest house and attracting anglers as well as those who simply wanted scenic beauty, might bring prosperity back to a township which otherwise may well be derelict in the next twenty years. But the capital required for the two latter enterprises is not available within the township.

t al. K-5 (1958) 1959 ES10 Highland Scots ES10
Park

also point to a decline in the numbers of sheep, although more are kept now than
From 1942-51 the numbers were more than doubled (263-565). A great deal of
t have been a result of the ewe subsidy, but part at least may be connected with
war boom in Harris tweed. By 1955, when the subsidy was suspended, numbers
to decline and have since fallen steadily. This year the township has only 374

Skye

101 more recent to the west, and in the industrial area of the
161 Great Glen the trend is reversing itself. To the north and
162 south depopulation has been more serious. To the east the general trend has been similar to that of Skye. We need not be troubled by statistics at this time, but for convenience
[178] the population figures are given in Table 1. The Outer Hebrideans have preserved more of the social aspect of the old culture than the Skye people while the Mainlander has felt the effects of the processes of acculturation with more obvious results than the people of Skye. In short, the Highlands are not a homogeneous region. They represent a great diversity of conditions.

My information on the contemporary culture of the Isle
101 of Skye was provided by the residents of three communities,
115 the villagers of Portree and the crofters of Glendale and
101 Kilmuir. Portree is a small nucleated village with a popu-
621 lation of a thousand. It is important to the study because
[368] in many ways it represents an alien way of life. Here are found the county and national government offices, staffed mainly by newcomers to Skye, which serve the whole island.
[34] Here too, are the grocery, drug, clothing, and hardware stores which depend on the people of at least, northern Skye
[34] for a large part of their trade. There are a number of craftsmen who are equally dependent on the rural population. For the most part, the members of both groups are newcomers
[368] from the Lowlands or elsewhere in the Highlands. As the
[366] terminus for the mail steamer which links Skye with the mainland, and the hub of the daily bus service which connects the rural

Skye

Township size is variable. There is a complete range from 361
one township with a single inhabited croft and a population of 621
three, an old man and his two sons, to one with fifty crofts, [162]
held by thirty-two families, and a population of almost eighty. Most townships contain between six and twenty crofts.

The crofts are set out in long, parallel strips, typically, at right angles to the coast, or, if the township is in a glen, across the glen. In the older townships, the houses tend to be built at one end of the strip on the least productive land. The byre, if there is one, stands at the rear or either side of the house. Exposure or road access have not always been determining factors. Most frequently, it would seem, alignment along a road is present only because the county government has built a road into the township. Only in the more modern townships, those planned or re-organized within the last fifty years, have the crofters tended to build near the road. Several of the townships lack any apparent orientation. The houses are scattered up and down the lower slopes of the hills which rise above the cultivated land.

Wherever the configuration of the land and the environmental factors of soil and rainfall permit large settlements, there is a grouping of townships into the pattern of the British open country neighborhood or the French line village.[14] Scattered among the crofts, without any nucleus of community [366]
buildings, there are, usually, a school, one or two churches, [368]

[14] For an analysis of rural settlement patterns, see Loomis and Beegle, op. cit., pp. 229-231, 234-237.

The crofters of northern Skye are dependent upon the 272
village for the goods of the shopkeepers and the services of 366
the tradesmen. Several times a week food vans from Portree, 443
or from a national concern with headquarters in Portree, call
at the crofts. Twice a week a shopping bus brings the men
and women into the village from Glendale, and there is a daily
bus service from Kilmuir. For the nearby neighborhoods, the 368
village is of religious importance. If the crofters do not
come into the village to go to church, the local ministers
go out to serve them. They also send their children to school
in Portree. Few of the crofters take an active part in the
formal social life of the village, but for all who come in
on business there is an opportunity for men to stop by at a
pub to have a chat with friends and women to get together
in a tea room for a bit of gossip. Then too, for many it
is an occasion to visit kinsmen who have left the croft.
Nevertheless, despite its functional importance, the village 369
has remained something alien and apart for the crofter. 829
Despite the bonds of friendship and kinship and mutual
economic dependence, there is antagonism between the rural
dweller and village resident.

Part of the crofter's hostility stems from the religious 369
ethos. On at least one occasion, Portree has been described 829
by a minister as being almost as wicked as Sodom and Gomarrah.[25] 771
In the eyes of the majority of the clergy, the village contains
the "synagogues of Satin" from which flow the poisons of

361 one or more country stores, a few workshops, and a post office.
621 Kilmuir will serve as an example of these larger settlements.
368
368 Along the shore of Loch Snizort, on the peninsula of
361 Trotternish, there is a broad, fertile plain. Including old
621 Loch Chaluim Chille, there are approximately ten square miles
311 of good land. Although the soil is not cultivated as intensively as in the days when Kilmuir was "the granary of Skye," this is regarded as the best agricultural region on the island.
162 In all there are 122 crofts, held by 105 crofters, in 9 townships. There are also two small farms. The population is slightly over 300.

361 The crofters' cottages are loosely strung around the
621 old loch and across the plain in an irregular "Y" shaped pattern (Figure 3). Basically the pattern resembles the French line village, but there are several features remi-
361 niscent of the British open country neighborhood. Most of
621 the cottages, it would seem, were originally built on the
491 landward fringe of the plain and along the shore of a small bay, known as Camus Mor, without any regard for road access.
178 In recent years, increasing dependence on motor transport has led to demands for roads. Now almost all the crofters, except those in Bornesketaig, have a paved road running by their door. About a third of the houses are on the county road which encircles the peninsula and links Kilmuir with the outside world via Portree.

621 In the center of Kilmuir, in the township of Balgown,
368 stand two spireless churches, a church hall, a two room school,

[TEXT CONTINUED ON PAGE 46]

and the homes of the ministers and the teacher. Standing 621
together, within a few hundred yards of each other, they 368
provide a focal point for the surrounding area. The remainder of the buildings which we normally think of as forming a village nucleus are widely dispersed. The post office, which 621
is also a general store, is just over a mile north of churches 366
and school, in the township of Kilvaxter. Another mile away, 368
off the main road, in Bornesketaig there is a small shop. South of the churches and school, almost two miles away, there is a shop and a smithy in Linicro. The remaining shops and workshops are similarly scattered hither and yon among the crofts.

Glendale shows much the same pattern of settlement. 361
Stretching along the shore of Loch Dunvegan, through Glen- 621
dale, on either side of the Hamara River, and out along the shore of Loch Poolteil, there are 156 crofts in 11 townships. These are the homes of 144 crofters. The total population is in the neighborhood of 350. Like the people 491
of Kilmuir, the Glendale residents have also become dependent on roads, and they have tended to build their new cottages near a road of some sort. The single church, the post office, 368
and the shop stand fairly close together near the center of 621
Glendale. One school is about a mile away in Borrodale, 366
and the other over a mile away in Colbost. Neither Glendale nor Kilmuir have a village hall. When the Glendale crofters have a meeting to discuss the club farm or when the Kilmuir crofters hold a club meeting, they use the school. Now let 621

e village might best be described as an 621 368
en though it was planned. The main function
r as the whole island is concerned is that

of an administrative center. The government offices, however, 621 368
are scattered about the village. One is down at the pier;
another is half way out of Portree on a trunk road, and still
a third is tucked away on a side road down by the shore of the
harbor. The post office is behind the court house, on the
opposite end of the village, and the school, the only secondary
school in all the Hebrides of the County of Inverness, is out
of the village all together on another trunk road. For northern 621
Skye, Portree is the shopping center. The shops are along the 366
main streets which run off the square and along the road which
leads down to the pier. All of them are in remodeled houses.
For the immediate area surrounding the village, Portree is a 621 368
religious center. The churches stand together, except one
which is on the opposite side of the village; the ministers'
homes are dispersed on the fringes of the village. Long ago 621 [193]
Portree was known as Ceilltarraglan, (burying place at the foot
of the glen). The old village was no more than a church, school,
inn, and jail which stood overlooking the houses of a few
fishermen along the bay. The surrounding area was given over to
farming. The differing ages of the buildings show how the
village spread along the bay, up over the terraces, out across
the flats, and finally, with the assistance of the County
Council which has built all of the new houses, on to the hill
which overlooks the shops and the harbor. Although only the [161]
jail remains as a sentinel of the past, the differing ages of
the houses also tell how the population grew from a mere hand-
ful to 1000 in over a century and a half.

By 1845 there was a small crescent of houses along the shore, 175* 178*
about twenty in number, and on the raised terrace there was 361
a new inn, a church, a post office, a bank, several shops, and 621
a street of homes.[34] The population had grown to all of 510.[35] 366
The existence of the village depended on the summer cattle 368
markets and the fishing industry, which was in the hands of [161]
newcomers.

Following the establishment of Portree and accompanying 175* 178*
the gradual decline in self-sufficiency, the Island was brought 648
into closer contact with Great Britain by an extension of
regular means of communication.[36] Regular communications, of
course, are a prerequisite for commercialization. There must
be access to markets for the local produce and access to
consumer goods. Without such access no man can specialize;
with it the Sgiathanach has been diinclined to specialize. The [491]
old drove roads, the beaten paths which had served them well
for many centuries, were now supplemented by roads in the
Lowland sense of the term. By the end of the period most of [505]
the more accessible townships had been connected with Portree
and the mainland, and a steamer had entered regular service
between Portree and Glasgow. These factors paved the way for
the introduction of commercial sheep farming.

the Outer Isles, an area of recent depopulation, there are enough youth to resist the dictates of their elders.[25] If they cannot have a dance in a hall, they hold their dance on a plank bridge. In Kilmuir the crofters are looking forward to "Effectual Calling." To defy the elders, or allow their children to run counter to the wishes of the elders, would mean a loss of all hope for salvation.

For the majority of crofters, any form of amusement is objectionable, but there are slight differences among the affiliates of the several sects. The Church of Scotland is the most lenient. For adherents, concerts, film shows and similar organized forms of entertainment may be admissible, especially if they are held outside the neighborhood. There is a "picture bus" from Kilmuir to Portree on Wednesday and Saturday night. Sports activities are often considered as wholesome outlets for the youth. Some of the ministers, feel the lack of social contact with their people and believe they might do some good by taking part in life outside the pulpit. The Church of Scotland minister in Kilmuir occasionally attends the Crofters' Club, the only secular activity admitted in the neighborhood. Significantly, Free Church opinion, although the voice of a minority, has prohibited the playing of pipes and recitals of the Gaelic Choir at the annual agricultural show. The Church of Scotland minister in Sleat has taken a hand in the village hall. Unorganized dances are condemned. This is not because dancing

has direct or indirect communication with Glasgow, Stornoway and North Uist. In summer a thrice-daily bus runs to Stornoway, and once a day a bus makes the round trip of East and West Harris. The township, linear in pattern, east to west, includes sixteen shops which cater for most of the needs of the population within reasonable travelling distance; it also has two cafés, a post office, a licensed hotel, a hall for social functions, a masonic hall and two churches. The Sir E. Scott School here is the only secondary school in Harris with an academic stream. Most of the working population is employed in the service industries, the professions and the tweed industry. Tarbert was a fishing port of some significance in the past, and is now a refuelling point for ships.

The absence of organised industry on a large scale, such as Lewis has, is a factor which tends to bring nearer to reality any desire on the part of Harris natives to leave their native soil. There are small pockets of industry, but these are only dabs of easing ointment on the excessive unemployment sore of 27 per cent. The main occupation is of course crofting, the income from it being augmented from a variety of sources. Some crofters concentrate on the production of Harris Tweed, perhaps using the wool from their own sheep; the natural dyes from the lichens which grow on the rocks and from other plants are still used occasionally. Others specialise in knitwear. Recently shell-craft and wood-turning have been added to the traditional crafts, with a view to the tourist market. Fishing, of course, plays a part in the economy in some communities. The interest of such organisations as the Scottish Country Industries Development Trust has been concentrated on the potential in shell-fish processing, and the production of knitwear on a larger scale than exists at present. Roadwork gives employment to about thirty men, but is of course seasonal.

An apparently bright light on the employment horizon showed itself in 1965, with the opening of a quarry at Lingerbay. The mineral quarried was anorthosite, a white granite used as an abrasive in cleaning products. A 99-year lease was taken out by a subsidiary company of William Robertson (Shipowners) Limited, Glasgow. But the quarry was closed in 1967 due to lack of orders.

368 ground. Some of these provide for a much larger area and indeed the policeman serves the whole of the parish of Uig. Three buses per day in each direction operating on a circular route provide transport to Stornoway.

UPPER CARLOWAY

427 133 The township comprises 51 registered crofts and 28 feus and allotments which are situated on the drift covered slope which rises from the head of Loch Carloway. The crofts are each about half a mile in length and from 5 to 25 yards in width aligned up and downslope. The lowest portion of the croftland is just above sea level and the highest approaches 225 feet O.D. The key crofts are numbers 30 and 31 whose boundaries come to a point thus enabling the crofts to be accommodated on the arcuate hill face. In the east are the crofts of Park Carloway which were lotted at a later date than the main area of croftland (numbers 1 to 40).

Only two crofts are fragmented ('fixed runrig'), these occupy lowlying hummocky land near the river where fencing would be difficult. Elsewhere fencing has been almost completed between the roads, but above the upper road fencing is less common, usually only being undertaken by the more enterprising crofters with more promising land; the bare rock surface of crofts 9 and 10 precludes any such attempt there. Almost all the fencing has taken place since 1946.

427 311 The 51 crofts and 28 feus and allotments are operated in 56 working agricultural units. The total land reputed arable 134.4 acres and the outrun 82.65 acres which gives a total fo 217.05 acres of individually held ('croft') land. The method of working is controlled by the relationship of slope, soil and elevation. Three zones may be distinguished, namely

(1) Below the road;

a) well drained and fairly accessible,
b) poorly drained and often far from the croft house

(2) Between the roads: a main zone of cultivation

(3) Above the main road an upper zone

a) with bare rock and thin soil
b) drift covered - similar in character to (2), but more exposed

Crofts 1 - 32 occupy all three zones
" 33 - 40 and 46 occupy zones (2) and (3)
" 49 is in zone (2)
" 41 and 42 are in zone (1)a and are in 'fixed runrig'.

241 407 In nearly all parts of these zones it is possible to use a tractor and so the cultivation of oats and cutting of hay is accomplished. It is usual to work the potatoes by horse, but only one man preferred to do all his ploughing by horse. This widespread use of the tractor is in marked contrast to the townships southeast of the Loch where it is almost impossible to use the tractor in many places. The significance of this in the contrasts in methods and efficiency need hardly be emphasised.

461 Life in a crofting township is governed by a very distinctive pattern of working that is so strong that it even influences the operations of the mills in Stornoway, for each crofter, if he continues to work his croft fully, must take time off for the communal operations such as the shearing or dipping of the sheep and inevitably at certain times of the year he will be anxious to work the croft. The table attempts to set out the pattern of the agricultural year in this group of townships (Figure 40).

101 more recent to the west, and in the industrial area of the
161 Great Glen the trend is reversing itself. To the north and
162 south depopulation has been more serious. To the east the
general trend has been similar to that of Skye. We need not
be troubled by statistics at this time, but for convenience
178 the population figures are given in Table 1. The Outer Hebridean
have preserved more of the social aspect of the old culture
than the Skye people while the Mainlander has felt the effects
of the processes of acculturation with more obvious results
than the people of Skye. In short, the Highlands are not
a homogeneous region. They represent a great diversity of
conditions.

My information on the contemporary culture of the Isle
101 115 of Skye was provided by the residents of three communities,
the villagers of Portree and the crofters of Glendale and
101 621 Kilmuir. Portree is a small nucleated village with a popu-
lation of a thousand. It is important to the study because
368 in many ways it represents an alien way of life. Here are
found the county and national government offices, staffed
mainly by newcomers to Skye, which serve the whole island.
34 Here too, are the grocery, drug, clothing, and hardware
stores which depend on the people of at least, northern Skye
34 for a large part of their trade. There are a number of
craftsmen who are equally dependent on the rural population.
For the most part, the members of both groups are newcomers
368 from the Lowlands or elsewhere in the Highlands. As the
365 terminus for the mail steamer which links Skye with the mainland,
and the hub of the daily bus service which connects the rural

journey over to the "Capital of Skye" which stands on 621
rtree Loch.

The village of Portree, as stated earlier, represents
e only successful attempt to introduce a nucleated settle-
nt to the island. It was created by a landlord in the [656]
rly nineteenth century and has been fostered by the national
d county government, especially within the last twenty years.
thing has disturbed the English and the Lowland Scots more 621
an the alien nature of town life in the cultural heritage 648
the Sgiathanach. Ever since the sixteenth century the
brideans have been resisting the introduction of villages.
e Scottish and, later, the British, government has been
ly slightly less adamant in its determination that the country
ople should have a town, if not a burgh, come what may.

Indicative of its calculated creation, Portree has been 621
ilt "on the square," like so many English villages. Around 348 ●
e square are found the police station, courthouse, and jail; 177
o banks and one private home; two churches and the Masonic
ilding; and a hotel and two boarding houses. Equally in-
cative of the alien nature of the village, the square is
rmally used only when the people are going to or coming from
eir place of worship or business, or when they are entering
leaving Portree by the road which cuts across the square.
e exceptions are an occasional civil ceremony and performance
t on for the benefit of the summer tourists.

In reality, the village might best be described as an 621
ergrown hamlet, even though it was planned. The main function 348
the village as far as the whole island is concerned is that

of an administrative center. The government offices, however, 621
are scattered about the village. One is down at the pier; 348 ●
another is half way out of Portree on a trunk road, and still
a third is tucked away on a side road down by the shore of the
harbor. The post office is behind the court house, on the
opposite end of the village, and the school, the only secondary
school in all the Hebrides of the County of Inverness, is out
of the village all together on another trunk road. For northern 621
Skye, Portree is the shopping center. The shops are along the 346
main streets which run off the square and along the road which
leads down to the pier. All of them are in remodeled houses.
For the immediate area surrounding the village, Portree is a 621
religious center. The churches stand together, except one 348
which is on the opposite side of the village; the ministers'
homes are dispersed on the fringes of the village. Long ago 621
Portree was known as Ceilltarraglan, (burying place at the foot 103
of the glen). The old village was no more than a church, school,
inn, and jail which stood overlooking the houses of a few
fishermen along the bay. The surrounding area was given over to
farming. The differing ages of the buildings show how the
village spread along the bay, up over the terraces, out across
the flats, and finally, with the assistance of the County
Council which has built all of the new houses, on to the hill
which overlooks the shops and the harbor. Although only the [161]
jail remains as a sentinel of the past, the differing ages of
the houses also tell how the population grew from a mere hand-
ful to 1000 in over a century and a half.

mainly because there are enough young people to form a strong 571
age grade of their own. The more liberal outlook of the 184
villagers is, however, tempered by the old men. 554
888

Religion

The attachment to the past embodied in the social and 771
economic aspects of the culture carries over into the religious
life of the Sgiathanach. He is a Presbyterian who continues 795
to worship and view the world within a pattern which charac-
terized the Scots of the sixteenth and seventeenth centuries.
The doctrine and theology are derived from the teachings of
Calvin as interpreted by John Knox and refined by the Covenanters
of the seventeenth century. To the original ethical code
a strong measure of influence from the English Puritan move-
ment has been added. The guiding principles are still fore-
ordination and election. The dominant motivating factor is [785]
asceticism.

One of the outstanding features of the island today is 348 ●
the large number of churches for such a limited population. 795
To serve the 8,600 people there are 21 churches with ministers
and 13 mission stations. A hundred years ago, when the [178]
population was almost triple the present number, there were
only seven ministers on Skye. The present abundance is the out- 795
come of a series of religious schisms of the past century.
There are now four Presbyterian sects. Of all the neighbor- [184]
hoods on Skye, only Glendale is religiously homogeneous.

Portree has three Presbyterian churches and, in addition, 348 ●
an occasionally used Episcopal church and small Catholic 795
chapel for newcomers. Kilmuir has two Presbyterian churches,
and the population includes affiliates of three denominations.
In contrast to the pattern of schism in the United States and, 795
indeed, in most of the Western World, the schisms on Skye 178
have been due to a strong desire to maintain cultural conserva-
tism. Each time a church has tended to become more lenient
in official policy, there has been dissension and disruption.
This does not, however, mean that the several sects are
dissimilar in practice and outlook. In Scotland the local 795
kirk is governed by the congregation in accordance with the
democratic principles laid down at the Reformation. The
people call their minister and elect the lay officials of
the church.

Religion is of supreme importance for an understanding 781
of the configuration of the local culture. In fact, beyond 182
being a highly integrated and systematized pattern in itself,
religion has come to provide a focus for the culture. Through
the religious pattern the culture achieved a reintegration
and found continuity at a time when the people were faced with
the prospect of enduring instability, if not total social and
cultural disintegration. Although it has the appearance of
being an extremely negative institution, in that much of the
former secular life has been circumscribed by clerical censure,
religion has sanctioned the fundamental values and patterns of

*175 *178 361 621 511 Not only were villages completely alien to his heritage but also he had neither the need to purchase commodities nor the opportunity to accumulate a surplus for buying more than a little grain or an occasional necessity. Whatever his small needs, they could be satisfied locally, especially, by turning to a local tacksman or the estate factor, both of whom made grain and a few sundries available on an extended credit-with-barter basis.

*175 *178 361 621 Plans were drawn up for the establishment of a village at Portree shortly after the Forty-five.[29] Over fifty years later the best that could be said of Portree was that it had "the appearance of a village."[30] Another attempt to bring a village to Skye was made in 1787 when a group of exiled Highlanders in London built the abortive fishing village of Stein.[31] As a part of the reorganization of the MacDonald estates, villages were laid out at Portree and Kyleakin sometime after 1811.[32] Kyleakin failed to develop.

[368] By 1820 Portree had become an administrative center with its own jail,[33] one of the hallmarks of civilization.

By 1845 there was a small crescent of houses along the shore, about twenty in number, and on the raised terrace there was a new inn, a church, a post office, a bank, several shops, and a street of homes.[34] The population had grown to all of 510.[35] The existence of the village depended on the summer cattle markets and the fishing industry, which was in the hands of newcomers. *175 *178 361 621 [364] [368] [741]

Following the establishment of Portree and accompanying the gradual decline in self-sufficiency, the Island was brought into closer contact with Great Britain by an extension of regular means of communication.[36] Regular communications, of course, are a prerequisite for commercialization. There must be access to markets for the local produce and access to consumer goods. Without such access no man can specialize; with it the Sgiathanach has been diinclined to specialize. The old drove roads, the beaten paths which had served them well for many centuries, were now supplemented by roads in the Lowland sense of the term. By the end of the period most of the more accessible townships had been connected with Portree and the mainland, and a steamer had entered regular service between Portree and Glasgow. These factors paved the way for the introduction of commercial sheep farming. *175 *178 648 [491] [505]

621 571 450 respectively.[6]

Unlike the township, the neighborhood typically has no formal organization and is not necessarily a cooperating, economic unit. Always, of course, there is a consciousness of common interest. In the case of Glendale this is spiritually symbolized by the church and economically, by the large club farm in which all the owner-occupiers have a share. In Kilmuir there are two churches, standing close together, and the crofters have a common economic focus in the drained loch which all use in equal shares for meadowland. There is also a crofters' club. Further symbolization of their common interest is provided by traditions, memories of notable personages and events peculiar to themselves. Always, the consciousness of common interest is expressed by a feeling of superiority over the members of other neighborhoods. 621 571 186 [368]

361 There is but one trade-center village on the island, the village of Portree.[7] It is the only true nucleated settlement. Built on the square, but still retaining the appearance of an overgrown hamlet, it is a small grouping of non-agricultural dwellings, government offices, churches, shops, a school, and the homes of those who make their living by serving the rural areas. In addition to its function of providing goods and services for the surrounding neighborhoods, it also links the island with the outside world. Although thirty-six miles from the mainland, it is the entry port for the government officials, 621

---

[6] Murdock, loc. cit.; and Linton, loc. cit.

[7] For a discussion of the importance of the trade-center village, see Loomis and Beegle, Rural Social Systems, pp. 188-197.

newcomers to the neighborhood, if not the island. Let us now turn to Portree to see how important status is in this alien village. 554 182

The Trade-Center Village

We come now to a consideration of the trade center village of Portree. We have seen how this small settlement was created by a landlord in the early nineteenth century and now it has been fostered by the government. We have also seen how the village has assumed a host of important functions. Primarily, it exists to serve the rural neighborhoods and to provide a link with the outside world. For the crofting neighborhoods it is, in order of importance, an administrative, economic, religious, and social center. Here are found the Ministry of Labor, the Department of Agriculture, the National Assistance Board, the sanitary and road engineers, the local Registrar, the central police headquarters, the main post office and telephone exchange, the court of the justice of the peace, and the seldom functioning sheriff's court. It is to Portree that the Land Court comes to decide on such important matters as rents and succession to the croft. As a seat of education, Portree's influence extends even wider, for it is the only secondary school in all of the islands of the county of Inverness. For people on the southern end of the island the village exists only for administrative purposes. 632 [363]

The crofters of northern Skye are dependent upon the 600

ielings, and that therefore the shieling area per township is in proportion to the number working units in that township (total, 88 working units on the island). If these shares e deducted it will be seen that only Kirkibost and Tobson common grazings exceed in ea those of Lundale, the smallest of the Bernera Shore grazings, and that even this is longer so if the special grazings, mainly later enlargements, are further deducted. l this serves to emphasise the relative crowding on Bernera Island and the consequent tal importance to most working units of the shielings. This has probably increased in e last decade with the construction of the bridge, for whereas previously there was a annual ferrying operation to the mainland, tedious, unpleasent, and exhausting for both east and man, nowadays droving to the hills is an easy matter.

A somewhat different picture emerges when land is related to tenants and working nits (table 21). If the inbye per croft tenant is calculated it is seen that Croir has the rgest, (29 acres), rivalled only by Lundale, (26 acres), Hacklete, Kirkibost, Earshader, nd Crulivig form an intermediate group (11 to 16 acres), while Breaclete, Tobson and inshader have but eight acres or less. However, the average area of inbye is more evealing if calculated in relation to working units: then the Bernera Island townships are een to range from 7 acres (Breaclete) to 33 (Croir) while only Lundale has more than 0 acres, the others having 14 or less. For the whole island the average of inbye per enant (13.2 acres) is close to that for the Shore (12.8 acres) and the inbye per working nit (13.5 acres: 13.3 acres) is almost identical. Thus, there is considerable variation the amount of inbye land available per tenant and the amalgamation of tenancies into orking units does not seriously change this distribution.

None of the Bernera Island townships has as much common grazing per tenant, nor er working unit, as any of the Bernera Shore townships, (little more than 100 acres as pposed to never less than 160 acres). The Bernera Shore townships as a group have bout five times more pasture per tenant and per working unit than those of Bernera land. Breaclete stands out as the township with the greatest shortage of land.

The various forms of subdivision and amalgamation of crofts and parts of crofts, or her holdings, are summarised in Table 22. In the small townships of Bernera Shore ly Earshader, with four crofters, has non-crofting holdings with stock; there is little nalgamation. In Bernera Island, however, only Hacklete has the same number of orking units as of registered croft holders and Breaclete, the township with the greatest ortage of land, is also the township with the greatest degree of unofficial change and tromission. In contrast, Tobson, in spite of its unconsolidated plan, presents a simple cture. Breaclete also has the largest number of feus, including the only feus not nctioning as agricultural units. This emphasises its function as a centre for the Island. has both manses, both churches, the War Memorial, the school and the District Nurse.

These changes must however be seen in perspective. The Bernera region has not ffered from the type of amalgamation which is the result of decay and which facilitates rther decay; the actual change is not very great. The number of agricultural working nits is 98% of the number of crofter-tenants. It is illuminating to compare the region ith Sutherland where many former crofts, quite abandoned to rough pasture, have been ken off the rentals. Apart from changes due to clearances, the Bernera region has ne of either type. Of 575 holdings examined in thirty-one townships in Sutherland, nalgamation has reduced the number of effective crofting units to only 437, i.e. 76% of e formal figure. Amalgamations by family co-operation are comparatively few in therland (26 out of 173 known examples) whereas subletting is common. A further brief xample may be taken from one of the Shetland islands where amalgamation has reduced e original number of holdings from something like 350 to about 250 working units.

and across the croft boundaries and it is along these that the majority of the houses are to be found so that as the roads followed the easiest course open to them so the settlement has moved to the roads.

A particularly interesting example of this kind can be drawn from Upper Carloway where a twofold movement of settlements has taken place; first, from about 150 feet above sea level, where the original black houses were built, there was an uphill movement to the upper of the two roads which cross the township at from 150 to 170 feet above sea level, and, secondly (and more recently), there has been a move to build at from 25 to 30 feet above sea level along the lower road which has become the main axis for the public services. Three main types of building exist then in this township. The first is the blackhouse of which only one or two now remain. Even these are not the primitive type of blackhouse, for they all have proper chimneys. The second is an ill-defined group which includes buildings erected during the later years of the fishing boom and in the period up to the Second World War. These houses are either one or two storied often with the traditional dormer windows; they form the majority. Finally there is the development of the modern bungalows which are built by the crofters but based on plans supplied by the Department of Agriculture. Few have ventured to build away from the level of the lower road.

How then does this pattern of settlement illustrate the changes referred to at the beginning of this section? The original houses were abandoned gradually as the temporary prosperity of the fishing enabled the crofters to build the better houses. These have seen great changes, but in most cases they are still occupied. Some have been extended and improved by their owners whilst others remain without additions almost as they were when first built. That the crofter owns his own house has certainly encouraged replacement in recent times. The generous grants and loans provided by the Department of Agriculture have been utilised to construct the modern bungalows on crofts where the original croft house stands as a byre and where the second house is sometimes inhabited by some relative or person who sublets part of the croft. It is rare to see such successive phases so close together in a landscape reflecting the varying fortunes of economic enterprise and the influence of government subsidies now so much a part of the life of the crofting township.

Roads and public services.

Carloway's importance as a centre for West Lewis is accounted for by the fact that at the break in the coastline caused by East Loch Roag the main road southwards from Barvas turns inland to Breasclete. Near the point where it crosses the Carloway river at Carloway bridge it is joined by a number of local township roads creating a focus for community services (figure 38).[1] Here also the line of the still unfinished 'Pentland' road, projected as a direct link with Stornoway during the fishing boom, reaches Loch Carloway and passes along its north shore to the pier at Borrowston. This substantial pier was the scene of great activity during the period of commercial fishing before the First World War.

The six hundred residents of the immediate Carloway area are served by eight travelling shops as well as by the local stores. Bread, fish, meat, green-groceries, library and bank all come to the end of the croft if not to the crofter's door. Of the vans one is based on Carloway, one on Breasclete and the rest on Stornoway. A mobile film unit visits once each fortnight. The churches and school rightly reflect their importance in the community by the commanding position which they occupy just above the bridge. Here too is the showground; the annual show attracts people from all over the island, being as much a social as an agricultural gathering. Other services are more dispersed but not far away. They include doctor and district nurse, policeman, post office, and football

[TEXT CONTINUED ON PAGE 103]

1. [Presumably the author means figure 39--Analyst]

hinterland with the outside world, Portree is a center for tourists during the summer. Due to the people's dependence on tourism and also the presence of newcomers, the villagers participate in a number of social activities which are not tolerated elsewhere on the island because of religious asceticism.

Glendale and Kilmuir are crofting communities, each with a population of about 300. All, except the ministers and school teachers, are dependent on the breeding of cattle and sheep and the growing of a limited amount of grain, potatoes and hay for all or a large part of their livelihood. All are bilingual, speaking Gaelic and English. Neither community has a village nucleus, but both have an economic focus. Glendale has a cooperative farm, and Kilmuir has a drained loch which has been divided among the small farmers. The significant differences between them are three. The Glendale people are land owners. In this respect they are rather unique in the Highlands. The Kilmuir residents, like most Highlanders, rent their crofts. The second difference is religious. Glendale is religiously homogeneous while Kilmuir includes church-goers of three Presbyterian sects. Finally, no formal social activities other than an annual meeting of the share-holders in the farm is allowed in Glendale, but Kilmuir has a club organization for the men who gather for lectures and discussion of economic problems.

Township size is variable. There is a complete range from one township with a single inhabited croft and a population of three, an old man and his two sons, to one with fifty crofts, held by thirty-two families, and a population of almost eighty. Most townships contain between six and twenty crofts.

The crofts are set out in long, parallel strips, typically, at right angles to the coast, or, if the township is in a glen, across the glen. In the older townships, the houses tend to be built at one end of the strip on the least productive land. The byre, if there is one, stands at the rear or either side of the house. Exposure or road access have not always been determining factors. Most frequently, it would seem, alignment along a road is present only because the county government has built a road into the township. Only in the more modern townships, those planned or re-organized within the last fifty years, have the crofters tended to build near the road. Several of the townships lack any apparent orientation. The houses are scattered up and down the lower slopes of the hills which rise above the cultivated land.

Wherever the configuration of the land and the environmental factors of soil and rainfall permit large settlements, there is a grouping of townships into the pattern of the British open country neighborhood or the French line village.[14] Scattered among the crofts, without any nucleus of community buildings, there are, usually, a school, one or two churches,

---

[14] For an analysis of rural settlement patterns, see Loomis and Beegle, op. cit., pp. 229-231, 234-237.

361 one or more country stores, a few workshops, and a post office
621 Kilmuir will serve as an example of these larger settlements.
[364]
[368] Along the shore of Loch Snizort, on the peninsula of
361 Trotternish, there is a broad, fertile plain. Including old
621 Loch Chaluim Chille, there are approximately ten square miles
311 of good land. Although the soil is not cultivated as intensively as in the days when Kilmuir was "the granary of Skye," this is regarded as the best agricultural region on the island
[162] In all there are 122 crofts, held by 105 crofters, in 9 townships. There are also two small farms. The population is slightly over 300.

361 The crofters' cottages are loosely strung around the
621 old loch and across the plain in an irregular "Y" shaped pattern (Figure 3). Basically the pattern resembles the French line village, but there are several features remi-
361 niscent of the British open country neighborhood. Most of
621 the cottages, it would seem, were originally built on the
491 landward fringe of the plain and along the shore of a small bay, known as Camus Mor, without any regard for road access.
[178] In recent years, increasing dependence on motor transport has led to demands for roads. Now almost all the crofters, except those in Bornesketaig, have a paved road running by their door. About a third of the houses are on the county road which encircles the peninsula and links Kilmuir with the outside world via Portree.

621 In the center of Kilmuir, in the township of Balgown,
368 stand two spireless churches, a church hall, a two room school

[TEXT CONTINUED ON PAGE 46]

6. Ducey	E-4,5	(1953-1954)	1956	ES10 Highland Scots ES Skye

and the homes of the ministers and the teacher. Standing 621
together, within a few hundred yards of each other, they 368
provide a focal point for the surrounding area. The remainder
of the buildings which we normally think of as forming a
village nucleus are widely dispersed. The post office, which 621
is also a general store, is just over a mile north of churches 366 368
and school, in the township of Kilvaxter. Another mile away,
off the main road, in Bornesketaig there is a small shop.
South of the churches and school, almost two miles away,
there is a shop and a smithy in Linicro. The remaining shops
and workshops are similarly scattered hither and yon among
the crofts.

Glendale shows much the same pattern of settlement. 361
Stretching along the shore of Loch Dunvegan, through Glen- 621
dale, on either side of the Hamara River, and out along the
shore of Loch Poolteil, there are 156 crofts in 11 town-
ships. These are the homes of 144 crofters. The total
population is in the neighborhood of 350. Like the people [491]
of Kilmuir, the Glendale residents have also become dependent
on roads, and they have tended to build their new cottages
near a road of some sort. The single church, the post office, 368
and the shop stand fairly close together near the center of 621
Glendale. One school is about a mile away in Borrodale, [366]
and the other over a mile away in Colbost. Neither Glendale
nor Kilmuir have a village hall. When the Glendale crofters
have a meeting to discuss the club farm or when the Kilmuir
crofters hold a club meeting, they use the school. Now let 621

econdary school, the 'Nicolson', has had since its inception a ormidable academic record Back in 1907 work from the school as included in the educational section of an International Ex- ibition held in Christchurch, New Zealand: this was appropriate ecause emigrants from the west Highlands, notably from Harris nd Lewis, were among the pioneers of New Zealand education century ago. In 1957 new extensions were opened, costing about £300,000 and making the school the largest of its kind in the Highlands area. It is co-educational, its primary and junior econdary departments taking only Stornoway children and its enior secondary department catering for those from both Storno- way and rural Lewis. Many board out in the town during the veek, returning home at weekends.

In providing social facilities, the town has placed itself in the osition of an agent for those things deemed necessary for life, nd is a middle-ground between the rural repression of the Free Church and the city abandon of the mainland, with resulting lilemma. The public houses, the cinema, youth clubs, dances and uke boxes are all in direct opposition to the preaching of the Free Church. The result is tension between the town's desire to act as host for tourists and its wish to fulfil its duty on a religious lane; to instance this, the Stornoway Sabbath is less strict than he Lewis Sabbath. In keeping with the rest of Lewis, social tandards are extremely high. Home is the centre of life, as it lways was; the sense of community and communal responsibility s there. Divorce is practically unheard of, and the incidence of rime, as such, is extremely low.

178
291
The dress of the people has changed. The men commonly wear overalls instead of the fisherman's blue jersey. Till 1919 every woman and girl wore the black petticoat striped with colours, dark blouse, often with stays, and a knitted muffler round her neck and over her head. In summer the tartan shawl was more typical of Sundays than week days (Plate IX). In clothing, a change for the worse preceded a change for the better. The abandonment of homespun, rich in wet-resisting oil, for machine-made cloth was at first a loss; but oilskins, waterproofs, and rubber boots are a surer protection to all on land or sea. For much of the year the women went barefoot but for the *osanan*, worn except in warm weather; these are stockings leaving the sole bare and kept over the foot by a band passing under the middle toes. In a wet climate with much soft ground this was a sensible custom, for wet feet, easily washed, were warm and dry as soon as the women came indoors. They moved hardily, yet a little warily, for fear of stones and, when not fatigued, with a short, springing step which was a pleasure to watch. At the same time their feet were sorely tried by rough heather or stony ground, especially when they were carrying a laden creel. Now nearly all except elderly women wear shoes (or rubbers) and stockings. They have given up the dark, striped full skirt and petticoat worn till 1919 and adopted the skirt and blouse or jumper of the towns, or the short frock so much simplified since Edwardian times. In fine weather the head is bare, though often netted because of the wind.

(369)
As dress changes, it is often said that the country copies the town; the reverse were truer, in essentials. By 1914 the townswoman had begun to copy her sister in the country, seeking for common sense and simplicity; and what is true of dress may be true of other things.

361 it command and make it the leading settlement of the
366 Hebrides, with a population fluctuating around 5000.[1]
162

2. *Aspects and Problems of the Burgh*

361 The little town pleases by its views over the harbours,
632 outer or inner—sheltering perhaps a steamer or two and the clustered fishing vessels—across to the wooded skyline and the beautiful grounds of the Castle, a-flower in spring with rhododendrons. Or framed in trees from the Castle policies, the harbour and even the roofs and
[342] smoke of the houses are not unpleasing (Plate II). But the town's chief charm is its setting, not itself, though its plain dwellings with 'harled' or rough-cast walls and slate
[746] roofs are simple and inoffensive. In rehousing, the Local
[656] Authority had respected Scottish domestic features. But the greater use of local materials, labour and skill is surely desirable in the Island with its many half-employed men, who need such work to maintain income, health and morale.
[362] As is to be expected in view of low incomes, and the extremely primitive housing in the country, urban housing
[162] is inadequate. In Stornoway burgh in 1931, 44 per cent, or nearly half the population, still dwelt in houses of one to three rooms, 17 per cent in four (including attics often with no dormer windows), 20 per cent in five or six, and 18 per cent in seven rooms and over. There has been improvement up to 1939, and after 1945, but much remains to be done.

• 369 Turning to cultural life, profound differences divide
632 the town from the country about it. Whereas in the townships of rural Lewis the people are almost purely natives

[1] The burghal area was extended in 1935. At the census of 1951 its population stood at 4950. This showed an increase of 15·9 per cent above the population enumerated in the same area in 1931.

• 369 of the place, even the schoolmaster and ministers being
632 mostly Islanders, in Stornoway an important minority of the officials and business men hail from the mainland, and some of them from the Lowlands. New blood has undoubtedly been needed to promote enterprise, to foresee new possibilities, and even, at times, to make the best of the past. At the same time, the cleavage between town and country is marked in ways of thought and feeling as in
369 livelihood. To take a single criterion, that of speech, most
632 of the children of the town speak no Gaelic and many hardly understand it. While the percentage of Gaelic
197 speakers was 95 in the three outlying parishes in 1931, in the burgh only 70 per cent could still speak the old tongue. By 1951 the ratio, still almost unchanged in the outlying parishes and townships, had considerably lowered in the burgh.

369 The attempt to harmonise the interests of country and
632 town forms a hopeful aspect of the activities both of the Stornoway Trust, which holds the rural and urban property
[656] presented to the people of Stornoway parish by the first
[427] Lord Leverhulme, and of the Lewis Association, formed in 1943 to undertake studies of the Island to guide action
[654] for the future. The maintenance of the town's prosperity will depend greatly upon its industries of fishing and of
[228] spinning; and these are almost inseparable from the
[288] maintenance of the rural population for whom Stornoway acts as regional centre, and who weave with the yarn spun in the mills. Unity in constructive purpose could go far to build up the prosperity of the community.

361 With the recognition of the need for planning aroused
369 by the problems which faced the country with the return of peace, it is proposed, at the centre of the Burgh, to
632 rebuild the whole of the peninsular area of Point Street,

361 by co-operation of three authorities: the Town Council,
• 369 the Piers and Harbour Commission, and the Stornoway
632 Trust as owner of property, including Lews Castle with
[656] its grounds. The social situation is of quite exceptional
[654] interest, and an attempt to describe some of its features is made in Appendix II, on the Stornoway Trust and the Lewis Association.

(c) CHANGES IN ISLAND POPULATION, AND THE FUTURE

1. From 1801 to 1939

175 Until the middle of the eighteenth century, the growth
162 of population was periodically checked or even set back by famines and epidemics, such as smallpox, or by warfare.
[731] In 1801 the total population of the Outer Hebrides (in round numbers) was 21,700, and in 1831 it was 32,000. Of this total, Lewis carried 9200 and Harris 3000 in 1801 and, a generation later, in 1831, respectively 14,500 and 3900. In the graph (Fig. 12) the curve showing the average for the five landward or rural parishes of the Island (excluding Stornoway Burgh) indicates the fairly steady numerical increase there, almost to the close of the
[731] century. Following the evictions after 1831 and the potato famine of 1846–48, emigration caused a fall in the southern islands (*e.g.* in South Uist, Fig. 12). Forty years later, in 1871, the Outer Hebridean total reached nearly 40,000, of which Lewis alone, with 21,000, now gave more than half the total, and Harris—in spite of an intervening drop owing to evictions—4800. By 1901, in spite of losses in the southern isles, the total for the Outer Hebrides reached a peak of 46,200. Of this, Lewis already contributed almost

162 weaving and fishing, the fall in population would probably
[167] be small, if any, in 1941. This fall in the total figure was not so much a decrease in the number of families as in the
[168] number per family. The Island was only then following the restriction of population begun half a century before in the rest of Protestant Britain, though the causes, social and economic, are very dissimilar. Actually, little did occur to change either the rural situation or that of Stornoway, until the outbreak of war in 1939.

162 Since 1931 there had been no real decrease: Lewis is
178 a land of house-building, not of ruin and abandonment; of increase of holdings, not diminution, and even of agri-
• 369 cultural improvement. No doubt 'artificial' causes were
[657] at work: first, loans, grants and unemployment insurance and assistance—once known as 'the dole'—and, secondly,
[593] the money sent to elderly parents and dependants at home
[888] by young folk in Glasgow or abroad, or savings brought back by the young people themselves. Yet there is some
[226] fishing and agriculture still. Above all, 'hand-weaving'
[241] has grown, even if this be partly 'artificial'. Recently it was not only the elders who had returned to the Island, but
[286] men and women in the prime of life, so that the question of resources, livelihood and population in Lewis needs to be re-examined afresh.

167 The emigration which took place from 1949 to 1951
[464] followed directly upon the losses and the unemployment in the Island's Harris tweed industry. This crisis resulted
[651] from the imposition in 1949 of a Purchase Tax on hand-
[162] woven Harris tweed of 666 per cent. If the tax had been maintained and no adequate adjustment made, the effects on population would have been far-reaching.

APPENDIX I

434 difference between the issues and the payments in rural areas
436 (£28,000 as against £13,000) is no doubt due to orders drawn
to pay accounts. In this connection, a comparison of con-
369 ditions at an interval of nine years is suggestive for any attempt to distinguish the difference between rural incomes before and after the economic depression. In rural Lewis the total Order payments fell from over £33,000 in 1928–29 to barely £22,000 in 1937–38, a fall of more than a third. Although a decline in the payment of Money Orders in Stornoway was partly offset by an increase in that of Postal Orders there, it is thought that even this reflects a fall in the cash available in the townships, by indicating a fall in the average amount of accounts paid by country customers to Stornoway tradesmen. Even here, it is true, some allowances must be made, as latterly more shopping was done by customers coming into Stornoway by car and probably paying to a greater extent in cash.

[657] Comparisons may now be made, for all the data quoted, between Stornoway and the rural or 'landward' areas of Lewis, and also between landward parishes for all except the [161] Unemployment payments. Population having changed but little from 1931 to 1938, and economic conditions not being very different in the Island in the financial years 1936 and 1937–38, an approximation can be made of payments averaged per head of population. In the following table these are shown in £ sterling to one decimal place.

Average Payments (per Head per Annum)

434
436
369
657
729

	Stornoway Burgh	Stornoway Landward	Barvas	Lochs	Uig	Average Landward

(c) Money and Postal Orders	(8·4)	1·0	0·9	1·2	1·3	1·1
Total	..	..	..	..	..	10·1

APPENDIX I

434 The significant figure here is the average total payment per
head in the rural or 'landward' area, a sum of ten pounds
369 sterling, the complexity of urban conditions, even in a small town, making the total for the Burgh less significant. To put it differently, an average rural household of 4·5 persons thus received a sum of £45 a year from these sources.

All these figures—pointers to the complete facts, unascertained as yet—show that even with the help of these sources the average income of the rural Islanders was small. Comparisons of such figures with those for the rest of Britain would, of course, be misleading. To those who spend their working lives outside their native isle, Lewis is no more than a home; and for them it should therefore be compared to some urban suburb or 'dormitory', rather than to an urban centre of production or a typical agricultural district in the Lowlands.

434 It may help to compare the conditions of 1938 with those
of 1951 if, say, average weekly wage earnings for all British
171 workers in employment are taken for October of both years.
178 Thus, taking the 1938 earnings of 53s. 3d. as 100, those of 1951 were 141s. 1d. or 265 per cent of the first, a figure to be related to the cost of living index which had only risen from 100 to 202 per cent. The total wage-bill gave a still higher increase for Britain, from 100 in 1938 to 287 per cent in 1951. As food forms a heavy part of the doubled cost of living to people in poverty or near it, the crofters' own food does not greatly relieve them. The loss of employment following the close of the mills left little for them but to seek employment beyond the Island.

434 Summing up the facts of this Appendix, it may be said
that the Island furnishes (1) means for partial subsistence for
311 most; (2) means of earning a livelihood, for some; and (3) a home from which many go forth to earn a living for themselves (and their families) elsewhere—meantime contributing to national and local income there. Of these, many return later, either to found a home, to pay visits on holiday or during periods of ill-health or unemployment, or to retire upon the Island.

STORNOWAY

going concern to a trust which was set up to receive the gift and whose first object is to assist aged and infirm residents in the burgh. In effect, all profits earned by the shop are passed to the trust for distribution to those in need.

Almost half the houses in Stornoway were built by the local authority. The Town Council has never been afraid of rooting out unfit houses. By 1937, under the 1930 Slum Clearance Act, one person in four in the town lived in a council house. The housing schemes, though large, have still that element of community with personality, something often lacking in newly developed areas of other towns and cities. The Council also supports private housing by taking up sites, clearing and servicing them and then feuing them to private owners. The rents policy is to have no housing deficit beyond the statutory rate contribution (which works out at between £6,000 and £7,000 per annum). The Council's tenants co-operate with rent collection to a unique degree: collection figures are something like 99 per cent and on occasion 100 per cent. A vigorous housing policy is important to the town, as its population is now over 5,300 and still growing, mainly at the expense of the rural areas. Development plans at present envisage a 1981 population of about 9,100 persons within the parish boundary and including the burgh.

Stornoway is an island town and is an island's town: its rhythms of life are those of the island, regular and timed by nature, but with an added syncopation—the result of an urban outlook. In this context, Gaelic is the language, though English is the lingua franca. Deeper still in the methods used for communication is a kind of patois based on Gaelicised English, Anglicised Gaelic, with some other words that defy investigation into their origin. Many words find their natural forebears in Scots, American and the maritime tongues of Europe, which might be expected in view of Stornoway's importance as a sea-port of significance a century or two ago. The Stornoway language, as spoken by true-born natives, recognisable anywhere by another native, reflects the life of the cosmopolitan, sea-faring people.

Apart from its industrial opportunities, Stornoway has many of the more sophisticated urban facilities that people everywhere seem to crave, particularly with regard to education. The senior

181 621 178 437 829 People prefer to give money in exchange for car rides or other help, including peat-cutting, because "than you're independent." Friendships 572 are still weak, relative to friendships in urban 621 settings. Most information which is shared between [369] [521] individuals rapidly enters the pool of communal gossip. [476] Although many persons emphasize the importance of mutual aid in defining a friend, some emphasize the ability to confide and keep secrets.

621 178 602 Today many of the younger villagers do not know their relatives to the extent that their elders did. In one family, a girl who was about to get married had [685] [576] to ask her brother, who was the only one of the siblings interested in kinship connections, whom to invite to the wedding. It is still useful to retain an inventory of 602 484 one's relatives. "I have cousins in Glasgow and Australia that I've never seen, but if I ever go there [178] I'll have a place to stay." With the increase in transportation and income, more islanders are taking brief trips away from the island. During these trips, they almost always stay with relatives.

857 577 829 178 It is frequently said that children are now "cheekier," less inclined to run errands and obey orders meekly, and that they prefer to watch television or read books by themselves to playing with each other.

794 thanksgiving service. The visiting ministers, the "elect,"
796 and the adherents go their own separate ways. They have spent
five days in intense, emotional spiritual communion and they
carry away with them definite, vivid remembrances. Many of
them will meet again in a few weeks when they will exchange
[571] the roles of guests and hosts. The reciprocal nature in all
interpersonal activity on Skye is well developed. In many
ways, the Communion season parallels the Welsh Song Festivals.[18]

794 We noted earlier in our discussion of the Communion
796 season that there has been a decline in the number who attend
178 the Communions. I should like to add a few general consider-
ation to what I have already said on this point. Aside from
the influence of depopulation, there have been several influ-
ential factors in operation. The smaller attendance is
traceable to some extent to an almost imperceptible movement
by the youth away from the more conservative denominations.
The ever-increasing necessity of working for a wage, es-
pecially since most employment opportunities are in summer time
programs, is another cause. This factor is not, however,
important within the local kirk district because most ad-
herents and all the "elect" who work take a vacation in order
to attend. It does mean that visitors may only be able to
attend on the Sabbath.

178 The custom of visiting has almost disappeared in some
794 churches, including the Church of Scotland in Portree where
794
• 369 the fellowship meeting is no longer significant because the
574

[18] Rees, op. cit., pp. 129-130.

"elect" are predominantly newcomers and the elders are either 178
members of the landed gentry or newcomers. I was rather 794
amazed one day when a Skyewoman told me, "the 'Wee-Frees' 796
and 'Seceders' are no better than the Mohammedans giving 574
gifts to idols," when they sent food to the manse for the 369 •
minister's guests at the Communion. Over in Bracadale the [798]
custom is also losing its importance, except in the Free
Presbyterian Church, and the fellowship meeting has been
abandoned in the United Free Church because of the reluctance
of the members to engage in public displays, either at
Communions or at prayer meetings. The custom of visiting
has entirely disappeared in Sleat and Strath. One of the
ministers ascribed this to the isolation of the two parishes
from the rest of the island and from each other. Certainly
the Sgiathanach on the south end of the island seldom locks
to Portree and the northern crofter hardly ever goes to
Sleat, but this does not explain why people from the mainland
will go to Bracadale, by-passing Strath.

The vitality of religion can over-ride considerations 771
of family and friendship if a Sgiathanach deviates from the 626
accepted norm. We may recall the young girl who stole church
funds and was ostracized by her "people" and the whole com-
munity. Let us consider another example. Marriage vows, as 586
we know, are held to be sacred on Skye. Divorce is all but 771
unknown and separation is uncommon. To be precise there are 626
four known cases of separation. Nevertheless, if a husband
or wife were to break a taboo, it is expected that the offender
would be cast out. Forgiveness is not compatible with a

that the people of Skye, including many of the newcomers, 785
have not been favorably impressed by Skye Week. The consensus 795
is that it is not representative of Skye. For the Sgiathanach 541
the Highland Games are alright, but the concerts, dances and
similar festivities only cause ill feelings.

As might be expected social life is more vivid in Portree. 369 •
Here the members and the adherents of the Church of Scotland 795
partake of a number of recreational activities. In the winter 52
there is badminton twice a week. In the spring and summer [326]
there is a little golf and tennis. The limitations are not [526]
religious; they are climatic. Then, too, there is shinty.
We have already noted the existence of many clubs. There are [535]
regular dances. Moving pictures take place twice a week. [546]
All of these activities are run by newcomers; the Skyemen have [167]
a more or less passive role. The "elect" of the two smaller 795
sects are, to say the least, very much disturbed by these 794
frivolities. What is worse, the children attend the dances 626
and the concerts and the boys play shinty. They can find 883
enough solidarity among those of their own age grade to out- 52
weigh the threats of their elders. Apparently they find
enough security to be unaffected by the stern denunciations of
the minister from the pulpit. When they marry, however, they 794
have to recast the pattern of their behavior, for now the 884
elders are in a position to exercise control by withholding 626
baptism from their children. Some may turn to the Church of
Scotland.

Standing in marked contrast to Portree, in Glendale the 888
control by the aged is complete. There is not a single activity 883
626
[369]

796 may need just one more dry day to finish his harvest. If the
241 next day is the Sabbath, his one dry day may be two or three weeks away and the hay a sodden heap. Nor did the Sgiathanach, or any newcomer with a croft, change during the war despite all the pleas of the government for full agricultural pro-
796 duction. This is the one time that the Older Order Amish slogan "And be not conformed to this world" fully applies to the island. Circumspect behavior on this day functions to remind the people of all the negations and all the sanctions which religion has bestowed on the culture.

178 As in the case of Communions, there has been a gradual
796 lessening of the importance of Sabbitarianism, especially since the return of many young men and women from the war.
[369] Again, the rather spontaneous relaxation of the rules is most common in Portree. It does not have the encouragement of the ministers of any church nor the elders of any church,
[626] except the Church of Scotland. Thirty or forty years ago the ministers and the lay kirk officers had enough influence to stop the running of trains throughout the western Highlands, shipping in the Western Isles, and the Kyle-Kyleakin ferry
[486] on the Sabbath. Public transportation is still at a stand-
[204] still on the first day of the week, but the Sunday papers appear in Portree after the evening services, despite all the efforts of the ministers. They come by car from Inverness, by row boat across the strait, and by car to the village.

178 Before the war no one in Portree would let their
796 children out of the house, except to go to church with their
857

parents and to Sabbath school, nor would they allow children 178
to play games in the home. Today the children of the Church 796
of Scotland people are allowed to go for a walk, read, or 857
play games. Tourists, frequently, if not always, intolerant 484
of the strict Sabbath, have no doubt contributed to this 178
relaxation of taboos. Although a further development of the 796
tourist industry would be advantageous economically, tourists are a threat not only to the Sabbath but also to the whole religious complex. They set examples which the youth are only too ready to emulate. Before the war every hotel on 485
the Island, including all in Portree, and every boarding 796
house posted notices requesting visitors to refrain from using their cars for touring on the Sabbath. In many of the guest homes the request was the equivalent of a warning of removal. Today the signs are gone. Still not content, the tourist agencies in England and the Lowlands continue to make snide remarks in their literature, suggesting "a little more tolerance is needed in certain quarters." The youth and some 178
adults of Portree now have begun to go off for a drive around 796
the island. One reason why the Sabbath is still strong in 484
Kilmuir and Glendale is that tourists are not accepted in either district.

Strict Sabbath observance distinguishes three broad 796
groups on the Island. Portree is set apart from the crofters 545
by laxity, and the county people are set apart from the [369]
crofters by using the day for visiting and having afternoon [571]
teas together. The gentry, of course, are not under the

man is no longer concerned with the necessity of having his 771
children baptized, the venerable old men, the family-head 554
elders, prolong their social control by sitting in judgment 183
on those who seek salvation. The strength of age controls 626
is indicated by the continued ability of the elders to resist [178]
all attempts to introduce secular innovations to the crofting neighborhoods. Even in Portree the majority of the people are under the watchful eyes of the old men.

Many of the meaningful patterns of interaction are 771
religious. The rites of passage function to augment social 182
control, restore disturbed equilibriums, and establish new 626
ascribed statuses. The rites of intensification, including those associated with death, function to restore disturbed patterns of interaction in the family, nuclear and extended, and the larger social groups and to establish meaningful relationships when large congregations gather for the celebration of communion. Religion for the majority is not 771
merely dependent on attending church on the Sabbath and [782]
attending Wednesday night prayer meetings. Every day of the week begins with a prayer and ends with family worship. All social activity outside the home is ideally limited to [52]
the church, and the church is never used for mundane activity. Only in Portree are there a number of social activities to [369]
tempt the people. Kilmuir has no more than a Crofters' [575]
Club for men, and Glendale has no social activities, unless one would include the annual meeting of the share holders in the farm.

APPENDIX III

23 good. In response to this realisation, and encouraged too by
33 the growth and prosperity of the tweed industry, the Lewis
Association sprang into being in 1942-43. The Association's
aims are survey, planning and the initiation of action for the
public welfare, economic, social and spiritual. Something
should be said of each of these bodies in turn.

23 The membership of the Town Council, Harbour Trust and
33 Stornoway Trust overlap, the Town being represented on both
33 Trusts. Indeed by the conditions of the Deed of Trust drawn
up by Leverhulme (in 1923-24), the Stornoway Trust must
include the Provost of the Burgh as its Chairman, together with
Magistrates and Councillors. For some time past the Provosts
and Councillors have been chosen from the more important
business men of the town. Indeed as a result of the constitu-
tion of the Stornoway Trust, urban interests and outlooks might
easily gain undue preponderance at the expense of rural needs.
Nevertheless two members with strong rural ties were elected
to the Trust in recent years.

In view of the growing burden of deficit, the Trust felt
unable to frame a general policy, still less to carry it into action.
To meet the deficit, the Trust sold portions of properties without
reference to any general plan of town or country. Even after
the Trust began to accumulate a favourable balance, hand-to-
mouth decisions continued to be made, undirected by any
clear policy. The most lamentable case occurred when a
garage site was given to the chief Stornoway bus proprietor at
a road junction near the western entrance to the town, close
to the principal new housing schemes and opposite the main
gate of Lews Castle and the Lady Lever Park. The palpable
mistake in siting soon caused strong public criticism. The
Trust repented, and sought to obtain the garage proprietor
from extended use of the area. The parties went to law and
the case was fought through the courts until, in a final decision
reached in the House of Lords, the Trust lost and had to pay a
bill of some £4,000. The lesson of defeat in the court was severe,
capped as it was by the equivalent of a fine of £4 or £5 from
every family in the burgh. Coming at a time when the need

162 The circular, corbelled stone "beehive" hut, some still in good repair, are of uncertain
date. The best preserved are on the Mersgail Deer Forest; in remote situations which
make it almost certain that they were only occupied seasonally; three on the Garynahine
common pasture are associated with asymmetrically ridged, curving, laystyle. This,
178 however, need not imply permanent occupation of the site, nor does it solve the problem
233 of age; such lazy-beds are certainly old, possibly pre-potato (c. 1750 here) - but the bats
do not decay with age and may be very much older.

Early in the eighteenth century the present area of the parish of Uig was held from the
Macleods clan chief by 26 tacksmen, whose names are recorded in the judicial-rental of
1716, (Fig. 4 i). They, presumably, had sub-tenants but of these there is no record.
Sterkarra in Lewis the same rental records many small tenants holding direct off the
chief but in Uig, apparently, the tacksman and sub-tenant system remained intact.
Although we cannot be certain of their precise extent, the distribution of the tacks
(247) coincides fairly well with that of the better agricultural ground (Fig. 4 j). Five of them
cluster round Uig bay, four are in the Valtos-Reef area, and three around the strait of
Little Bernera. All these districts have machair; together they accounted for three
quarters of the total and more than half the sheep and cattle-grazing rents. What is more, these
rents represented 27% of the total rental of Lewis, whereas by 1887 Uig yielded only 17%
178 of the rental and by 1921 the proportion was reduced to 14%. The relative decline of
362 Uig is largely due to the growth of Stornoway; this shift in the centre of gravity of Lewis
has tended to exaggerate the remoteness and isolation of Uig in the present century.

By the end of the eighteenth century the tacksmen seem to have disappeared; at any
rate they are not mentioned in the remarkably detailed account of the parish given
in the Old Statistical Account (1792). Meanwhile the small tenants had multiplied!
162 whereas in 1755 the old parish * had supported 26 tacksmen, in 1792 the
178 minister recorded 118 tenants. At this time there were no crofts, plough not cart,
178 in the parish. The minister was cultivating potatoes and his family were eating them

TABLE 3

AVERAGE STOCK HELD BY EACH FAMILY

	1792	1959

Sheep	13	37
Horses	1.8	-
Goats	6.8	-
No. of families	387	450

Note: the figures for both dates refer to the area of the old parish.

[632] * The old parish of Uig excluded the Loch Carloway district, from Kirktick north; this area lay in Lochs parish until 1891. Values the old parish is specified figures quoted have been corrected to conform with the modern boundaries.

(See p. 2-Kinloch)

272

The crofters of northern Skye are dependent upon the
village for the goods of the shopkeepers and the services of 366
the tradesmen. Several times a week food vans from Portree, 413
or from a national concern with headquarters in Portree, call
at the crofts. Twice a week a shopping bus brings the men
and women into the village from Glendale, and there is a daily
bus service from Kilmuir. For the nearby neighborhoods, the 368
village is of religious importance. If the crofters do not
come into the village to go to church, the local ministers
go out to serve them. They also send their children to school
in Portree. Few of the crofters take an active part in the
formal social life of the village, but for all who come in
on business there is an opportunity for zen to stop by at a
pub to have a chat with friends and women to get together
in a tea room for a bit of gossip. Then too, for many it
is an occasion to visit kinsmen who have left the croft.
Nevertheless, despite its functional importance, the village 369
has remained something alien and apart for the crofter. 824
Despite the bonds of friendship and kinship and mutual
economic dependence, there is antagonism between the rural
dweller and village resident.

Part of the crofter's hostility stems from the religious 369
ethos. On at least one occasion, Portree has been described 824
by a minister as being almost as wicked as Sodom and Gomorrah.[25] 771
In the eyes of the majority of the clergy, the village contains
the "synagogues of Satan" from which flow the poisons of

[25] Rees, Life in a Welsh Countryside, pp. 128-129.

273

immorality. For these reasons, among others, the crofters 369
look down on the villagers. As one man said, "The crofters 824
think we all went to Hell long ago." In part the suspicion 369
and distrust of the villager has grown from the attitude of 824
the villager toward the crofter.

Many of the villagers not only look upon the crofters
as narrow minded and bigoted but they resent the presence of
the crofters on economic grounds. A few representative statements
will indicate their views. "The crofters always have their hand
out." "They're aye wantin'. They want water, electricity,
roads, and all sorts of things, and they don't pay a copper
for them." There is a foundation for these attitudes. The
phrase "rich man, the government" has become a common saying
on the island. The crofter has become accustomed to having
the government pay f o r a large part of the cost of his
house, draining his land, and bringing in water and electricity
as well as building roads and piers. Many have come to think
that there is no end to the obligations of the government.
There was one man, for example, whose roof was leaking. Even
though the house was his, crofters it will be remembered own
their homes, he reported it to his landlord, the Department
of Agriculture. Three weeks later, when one of the officers
got out to see him, the roof was still leaking. No, he did
not see why he should fix it. "Let the government do it."
To give another example, in Kilmuir one night there was a
discussion about reeds in the grazing land. "We have reeds
by the square mile," said one fellow, "the government should

274

362 do something about it." The villager feels that he is the one
274 who is paying for all the services and facilities the govern-
ment sponsors. There is a growing consensus that he is just
a working man who has to get along as best he can while the
crofter is coaxed, coddled, cajoled, and pampered with grants,
advantageous loans, and subsidies. "Sure there are poor
crofters just as there are men who fall in business," said one
man, "but if we can't make a go of it, we go down the drain."
Another man put it, "The crofter gets paid by the government
for doing nothing--for having a cow on the hill--all I get I
get by sweat, hard bloody sweat." These feelings are especially
common to the newcomers, but they are by no means held ex-
clusively by this group.

The Social Structure of the Trade-Center Village

121 The village of Portree has a complicated social
structure. While I can accept Murdock's contention that
social classes operate to unite members of different local
groups and to segment the community, I cannot accept his view
that the presence of social classes complicates the social
structure of a community.[26] Class status, as any status,
determines the pattern of reciprocal behavior. By placing
the individual in a group with expected behavior patterns,
the social structure may be simplified. The individual in
the group finds security in the cohesion with others who

[26] Murdock, op. cit., p. 88

271

strongly about this infringement of the traditional norms. 837
Gossip spreads very rapidly. The offenders are said to be 426
"no better than the tinkers." While tinkers are respected 369
because they have the power of the evil eye, they are not 824
accorded any more prestige than we would give a beggar. All
who have any contact with the neighborhood or the village
where the deviants live soon know all the details. Since 369
most of the adulterers on Skye have been in Portree, it adds
another brick to the wall which separates the rural neighbor-
hoods and the trade-center village. The offenders normally
leave Skye as quickly as possible.

The Sgiathanach cannot be said to have a strong sense 423
of property, or, more correctly, the land is valued as a 421
place of residence and identity not as something to be bought
and sold. We have seen that he uses his land communally and
that he often will not leave a will for the house, not to
mention his land. Even though the state thinks otherwise, he
looks upon the natural resources of the island as his for the
taking. At the same time, he normally respects the fruits of 421
his neighbor's labor. Any one can cut peat on the moor, but 369
no one, except an unthinking tourist, would take a piece of
turf once it had been cut. In a similar way, the children are 857
generally well behaved. In the village there is a bit of stone
throwing, a little profanity, and uncommonly some drinking on
the sly, but rarely do children show any disrespect for the
rights of others. One contractor, a Lowlander who came up to
Skye to make alterations on the school, was amazed. Skye

300

his neighbors, and he done them in and took all their money." 555
The villagers and, in particular, the county people 426
enjoy amusing stories about the crofters. One tale concerns 369
a crofter who received electricity from the Hydro-Electric
Board. After the cottage had been wired, his wife bought him
an electric razor. This created a problem. If he plugged
the razor into the single light socket, he could not see to
shave on a winter morning, but if he had the light on he could
not plug in the razor. There are many stories about crofters
who refused electricity because they were afraid the house
might blow up if hit by lightning, and there is the favorite
story of the old woman, on the Isle of Lewis, who thought
electricity was fine to see to light her candle.

To see how gossip, bordering on tradition, is indicative 522
of high prestige status, we may take the story of the doctor
of Kilmuir. One day just after a cattle sale the doctor took
the boat from Portree to Kyle. In addition to several local
people and many cattle, there were two Gaasnaahs on board. 369
The Englishmen asked the doctor how many cattle there were.
He thought there were quite a few. A hundred, the Englishmen
asked. "Sure," said the doctor. Two hundred, they asked.
The doctor again said, "Sure." They then inquired whether
or not the doctor could count. When he answered in the
affirmative, they asked how many they and the doctor were.
He replied, "One hundred, I am one and you two are nothings."
The core of these stories always involves the doctor's getting
the better of someone, especially an Englishman. It may be

in the nurture of the church by being tested on his knowledge 626
of the Bible and the Shorter Catechism. The elders, then, 851
sit in a judicial capacity. If the father measures up to the 888
standards imposed by the elders and the minister, who is their 794
choice and, therefore, must reflect their views, the father 797
is told to present the child for baptism. If he does not satisfy the elders, his child is refused the rewards of the church until his father mends his ways. Here the authoritarian function of the elderly finds expression.

Many men are reluctant to approach the elders to ask for the sacrament. Everyone knows when a man is going to be tested and judged. The humiliation of being refused forces the father to reform. Since the elders think in terms of habitual behavior, one or even two years may pass before the father will feel that he has continuously demonstrated his conformity to the satisfaction of the elders. Nor is the bond of affection between the elder and his people and friends strong enough to prompt any leniency. To do so would threaten the status of the elders and the continuation of their control. In one case a first cousin of the minister was refused.

In the trade center village the question of baptism is 369
a sore point for the ministers of the Free Church and the Free 626
Presbyterian Church. As might be expected, the elders of the 851
Church of Scotland are chosen from the county families and 888
the prominent newcomers. Neither group shares the views of 794
the Sgiathanach as far as their interpretation of circumspect behavior is concerned. For them baptism is administered to

the child. Consequently, the sacrament is normally administered 369
without even the formality of a kirk session examination. The 626
ministers of the other churches assert that non-church-going, 851
drunken fathers whom the kirk session has refused have gone to 888
the Church of Scotland and have secured the sacrament for their 794
children after pretending to mend their ways. They have then gone back to their former habits. It may be so, but at least one man in Portree was very surprised to find that the Church of Scotland can require a severe examination.

At baptism the child is formally introduced into the 851
folds of his father's church. His mother and father stand 794
before the minister and are admonished to bring up the child in the nurture and admonition of God, to the best of their ability.

Marriage is not a sacrament in Scotland, and, therefore, 585
does not provoke any strong resentment beyond a feeling that 179
the Church of Scotland should not have the exclusive right to proclaim the banns of marriage. It is the one time in 585
the life of a woman when she is the center of attention and 562
has complete control over the situation. She decides where 794
she will be married and what minister will preside. Church affiliation seems to make little difference. At least, the wedding of a daughter of a strict Free Presbyterian family in the Church of Scotland did not give the people any cause to gossip. Although a wedding is no more than a legal formality, the vows made at marriage are sacred. It would not strike Americans as being particularly significant to omit the promise to obey from the ceremony; Americans are said to have an

eternity. If he was one of the "elect," he will enjoy eternal 763
life. If he was not one of these venerable old men and women, 554
he can expect to suffer eternal damnation. Although baptism 773
is a sacrament and removes original sin, it is only the initial 851
step in the direction of salvation, which election alone confirms. Neither the minister nor any member of the bereaved 792
family offers a prayer. "What more can you do than bury him," 764
one woman asked. An old man said, "They are just as well 793
remembered without praying for them." In a community which 792
is dominated by the old people, and in the crofting neighborhoods where so many of the crofters are very old, death can be expected to disturb the equilibrium of social interaction. In Glendale during November and December of 1953 funeral processions made their way through the glen no less than nine times. The function of the minister is to restore the dis- 793
turbed patterns, both in the family and in the neighborhood 182
(or village). All work stops in the township for three days from the time of death. Some of the cosmopolitans of the 369
village, seeking to justify their deviating behavior, assert 287
that the lazy crofter looks forward to a funeral because it means three days of idleness. In the village, of course, it 369
is no longer possible to bring daily life to a standstill because the villagers serve a wide area. Too "people" of the deceased do stop work and close their shops. On the day of the funeral all blinds are drawn until after the procession has passed.

As he would if there were illness in the family, the 793
minister calls on the bereaved family and leads them in family 764

worship. If the deceased is a Sgiathanach, the minister will 793
call every night, if he can. Otherwise, he may call only 764
once. His participation in family worship helps to refocus the patterns of interaction within the nuclear family and within the small circle of "people," "friends," and neighbors who come to visit and take part. Some sophisticated villagers 184
take this opportunity to justify their own deviations, such 369
as going to a concert; for them this is all "a religious ceilidh with all their psalm singing, praying, and greeting." The 152
people do not keen, as they do in Ireland, but the women are 562
seldom dry-eyed. Again the villager may comment that the minister at least should say a few kind words about the dead, "just to comfort his family."

On the day of burial a second and more inclusive rite of intensification is held. On this occasion the function of the minister, often aided by an elder, is to restore the equilibrium within the total sphere in which the deceased habitually moved during his life. If the person had high prestige status, the ministers of two churches conduct the family worship. All the "people," "friends," and neighbors, both men and women, attend. The minister begins with a prayer for the family, asking God's guidance. This is followed by the singing of a few verses of psalm by all who have gathered. Next the minister reads from Scripture. He concludes with another prayer for the family. If there are two ministers, or a minister and an elder present, they alternate in leading the group. If there are any present who do not "have the Gaelic," they also alternate between English and Gaelic. We have seen how 764

There is another aspect to the prayer meetings. They 794
are no longer held in the Church of Scotland in Portree. 795
The ministers of the other sects say this is an indication 794
of the low degree of spiritual enlightenment among that 369
congregation. Further, Wednesday night is picture night in the village. The newcomers taunt the devout with, "off to the pictures?"

It is at these Wednesday night meetings that the people 554
get to know one another. They participate in the worship 571
through the eminent "Ken," who in a society such as Skye 794
where almost everybody is related on one side of the family 602
or the other by some bond of consanguinity or affinity, are the "people" or "friends" of the worshippers. This custom of offering extempore prayers not only augments the prestige of the "elect" but it intensifies the unity of the group and makes them secure in the knowledge that they belong. This feeling of unity and the sense of belonging is further strengthened in some churches by setting aside a day of Humiliation. Services are held during which the congregation 792
as a group beseech God for forgiveness for the poor spiritual condition of the world. In their minds the God of this world is surely the Prince of Darkness.

But for the interaction of the members of the several 794
sects, the control of the "elect" would not be as strong as 795
it is. The elders of one kirk cannot exercise any direct 626
control over the adherents of another sect. Through what agency could they express their judicial and authoritarian

same as in the crofting areas. When a young girl presented 794
herself for instruction in the significance and meaning of 795
church membership, preparatory to her acceptance of Communion, 369
she refused to take the final step not because of any personal 626
religious problem, but rather because such a step would upset her normal associations. What her Free Church and Free Presbyterian friends would say was her main concern. Who was she to become an "elect" member? Here, then, is the answer to how the elders of the other sects are able to control behavior of the larger group, through the fear of gossip as a negative social sanction and, perhaps, rejection.

The semi-annual Communion celebrations are rites of 794
intensification par excellence. Although some churches 795
celebrate only one commemoration of the sacrament, and it may be as early as February or as late as November, the months from late April until early September, are commonly referred to as the "Communion Season." The activities of the people during this period cast additional light on the influence of religion in ordering social relationships. While 573
clique membership based on sectarian affiliation is a secondary 571
factor in determining the patterns of interaction in the extended family in the local group, it is very important in determining one's wider relationships, the relationships between the neighborhoods and between the Sgiathanach and the mainland Highlander.

Within living memory thousands used to come to the 178
Communion celebrations from all parts of Skye and many nearby 794

ECOLOGY AND PHYSICAL ENVIRONMENT

THE CROFTING TOWNSHIP

361 The crofting township is not quite akin to the English or Low-
land village. Primarily it is a collection of dwellings of families
who, as social units, gain their subsistence from the land sur-
rounding the houses. The smallest number for a township is four
476 family units. A functional unit of four men was the minimum
necessary for a boat crew, or for the teamwork necessary to culti-
vate land; co-operation was essential if all four families were to
survive. And from this grew the same spirit of communal work
which in Lewis is seen at its best in the efforts to reclaim peat
bog and turn it into fertile grassland.

361 Hebridean townships come close to being the nearest approach
[565] to a classless society. The shape of a township is largely dictated
by the nature of the surrounding land. The shape of most of those
in Harris and in Lewis is either scattered or linear (houses disposed
in line at varying distances from each other), with little natural
[491] cover, either plantation or scrub. Often the main road runs
through the township; some have begun to develop lateral roads,
to give, from the air, the appearance of planning on a grid system.
244 Where gardens are cultivated, the produce tends to be a summer
vegetable supply for the household, little if any finding its way to
• 372 Stornoway shops for sale. Peat is the usual fuel, though in town-
ships near to the centres of Tarbert and Stornoway coal is burned;
the cost of freight, however, makes it expensive.

471 Most of the townships are owned by commercial companies;
individual lairds own some five dozen; the remainder belong to
public bodies and trusts. The actual distribution of ownership of
land on the island is as follows. Harris is virtually owned by in-
dividual lairds; a small percentage is owned by commercial
companies. The Lochs region of Lewis has a mixed ownership:
commercial companies, lairds, and public trust, the former being
the largest. Stornoway parish is wholly owned by public trust.
The Ness district is virtually the property of commercial com-
panies; a small fraction belongs to public trust. The Uig district
is the same, the smaller proportion, less than 10 per cent, being
the concern of an individual laird.

In Lewis, the public body mentioned is the Stornoway Trust,

THE OTHER ISLANDS

*175 18 [826] even to the extent that the St Kildans used their observations of the flights of birds both as compass and as omen for good or evil. Martin speaks of the islands with amusement and admiration. He indicates that the community was backward in some ways: they were illiterate, and wondered naïvely at the newcomers and their manners. 'The inhabitants of St Kilda are much happier than the generality of mankind, as being the almost only people in the world who feel the sweetness of true liberty.'

In May 1877, when the local tourist trade had hardly started, [276] HMS *Flirt* sailed from Greenock with food to relieve hardship [731] among the St Kildans, and an officer of the Highland & Island Agricultural Society on board reported that 'Tobacco was what [262] they invariably asked for'. The ordinary diet of the island consisted of, for breakfast, porridge and milk; for dinner, potatoes and the flesh of fulmar, or mutton and, occasionally, fish; for supper, porridge when meal was plentiful. Seabirds' eggs, from [272] March onwards, also formed a staple food. Tea was taken once or twice a week and the islanders were reported to be 'rather fond [342] of it'. There were eighteen inhabited houses, sixteen of which had zinc roofs, two being thatched huts. The sixteen new cottages had been erected about 1863, 'and are certainly much superior to the inhabitations of the same class of tenants anywhere in the [372] Western Isles'. All were well furnished, peat was used for fuel and there were two watches and one clock on the island. There were [405] some seventy-five islanders; most of the men were old, and only [162] two of them were unmarried, with twelve spinsters still to choose [212] from. All read the Gaelic Bible. The men were mostly tailors, shoe- [463] makers and weavers; every house had a loom. They made all their own clothing, the men also making the women's dresses, [294] and a good deal of blanketing and tweed cloth was made and [286] sold. Nearly every house had a spinning wheel and a large pot in which the yarn was dyed. The women were expert knitters. Each [462] croft and house was rented at £2 annually, sheep being charged [427] for at the rate of 9d per head; these charges were usually paid in kind.

439 Feathers of the sea fowl formed the principal export of the 435 island. The factor paid 6s per stone of 24 lb for black feathers; [237] and 5s per stone for grey. For these he received, in Edinburgh or

island; but islands in isolation must carry a population of suitable numbers and age structure before they can support even a minimum of amenities. In the Western Isles, Stornoway used to be the only community to have a semblance of the services taken for granted in similar towns on the British mainland. The elements of commerce, industry, education and religion were established there initially, to spread with characteristic slowness first to the immediately accessible areas and then to remoter regions. Though many parts of the island are now at least within practicable travelling distance of the social and public services expected in urban communities, some townships have yet to see one or another of them within their own boundaries.

The Stornoway Gas Light Company was formed in 1840 by Sir James Matheson, with a capital of £350. The plant consisted of one horizontal retort which produced about 1,000,000 cu ft of gas annually. The old buildings still stand, and the plant now has three vertical retorts with an annual production of just over 40,000,000 cu ft. Rural areas use Calor gas, introduced to the island in 1935.

The public electricity supply has of course made the greatest impact on the island as a whole. Electricity was known in the island long before the public supply arrived, generated privately by individuals, hotel concerns or public authorities. One of the first plants of significance was installed in the second municipal building in Stornoway (the first, built in 1905, was destroyed by fire in 1918), and was driven by a gas engine. In 1919 Lord Leverhulme installed an electricity plant in Lews Castle, which also had a private intercommunication system. While this work was being done Leverhulme proposed to give electric lighting to the town. Other buildings with their own plant included the hospitals and the mills, which were turning to electric motors for driving their line shafting, the power take-off for spinning and carding machinery.

In 1929 an electricity supply company, with a capital of £12,000 was proposed, the Stornoway Electric Supply Company being registered in 1932. Its financial fortunes were chequered, though revenue was rising slightly by the time the second world war began. In 1948, on nationalisation of electricity supplies, the

[Caversta]

Each croft is fenced but has a gate giving access to the common grazing, in which each crofter holds an equal share. The township has no specially enclosed area for fanking or other purposes and no fixed date exists on which the crofters open their gates for winter grazing. Breeding ewes are normally brought in for tupping in mid-October and November when crops have been gathered, and lambing takes place in late March or April. After dipping and inoculation with vaccines for black leg, braxy and louping ill, the sheep are put out on the common grazing in the second or third week of May.

The 642 acres of common pasture support a sheep stock equal to the sheep soum, but the overall stocking is only 88 per cent of the total souming. Two crofts only exceed their individual soums, while the others are well below the number required for greatest efficiency. The grazing is, however, poor for summer pasture, owing to the lack of grass, but the heather is valuable for wintering the hogg. Lewis Blackface sheep are the predominant breed and the wool, clipped in July, is sold to the Stornoway mills and the animals themselves are sent to the slaughter house. The 1958 loss at lambing was exceptionally high owing to a cold, dry spring preventing the growth of grass for the ewes. More than forty lambs and thirty ewes were lost by the township last winter, a number four or five times greater than the average loss.

Six cows, two heifers and four calves are kept in the township and tethered most of the year on the crofts. Calves are born throughout the summer months, but whereas early-born calves may be sold in the Autumn at six months old, those born later must be wintered to eight months until the Spring sales. The cows are served by the Department of Agriculture Highland bull at Habost, but although good prices are obtained for beef cattle, it is felt that for the family milk supply, a dairy bull would produce a better strain.

In addition to keeping stock, oats are cultivated on five holdings and potatoes on six. In most cases the land under each crop is less than half an acre and nowhere does it exceed two acres. The land has been built up into lazybeds about six to ten feet wide, separated by open drainage channels and worked by the spade. There are only two holdings where a tractor (hired from Habost) is used and the acreage cultivated only amounts to three-quarters of an acre. Conditions are not altogether suitable for mechanisation at present, for the terrain is very uneven and broken up by marsh and steep faces of bare rock.

Neither Torista nor Caversta is on a main road. The former is served by a track joining the road near Gromore, while the latter has a secondary road running as far as the township dyke, and an inferior footpath joining the main road at Garyvard. The lack of a good road within the dyke acts as a deterrent to the use of modern equipment and fertilisers. Byre manure is used on all the crofts and seaweed is brought from the shore and spread on the lazybeds. Artificial manures, used on only three crofts, must be carried over rough ground from the dyke. This lack of incentive to improve is perhaps even more marked by the fact that on one holding alone is a rotation practised - potatoes, oats undersown with clover, then hay for three or four years. Apart from this one instance, potatoes and oats are sown, perhaps alternately, on the same strips for many years. Natural grass yields the bulk of the hay and is often cut from lazybeds that were formerly cultivated. On one croft there is upwards of quarter of an acre where the old ridges can be seen to have a crescentic shape and are thought to date back more than one hundred years. A short distance beyond the township dyke is a similar stretch of land, now colonised by heather.

Peat still forms the principal fuel and, apart from one half acre patch within the dyke, is cut on the common grazing, as near the road as possible in May and June, and later brought home by creel, bicycle or tractor. Three of the six operative units still have gardens and all keep up to twenty chickens; rowing boats for line fishing, solely to supplement the larders, are also maintained.

In 1841 population records show that there were twenty-two persons at Caversta and seven at Torista. After 1881, when maximum figures of fifty-nine and nineteen were noted, there was a secondary peak in 1911 in Caversta, followed by a steady drop to twenty in 1951 and eighteen in 1958.

INTRODUCTION

Headrick's recommendations. However, he promised to make experiments on the economic value of the 'bog-ore of iron' found in many parts of the island, with a view to making bar-iron. Peat was to be used as a fuel for smelting.

With so much water on the island, it is natural to expect to find some of it harnessed for the generation of electricity. The Gisla hydro-electric scheme is on the west of Lewis, to the west of the shores of Little Loch Roag. The Harris scheme is at Loch Chliostair, at the foot of the three peaks of Tirgamore (2,227 ft), Ullaval (2,135), and Oreval (2,165). Some 12 per cent of the island's total electricity production is generated thus, the remainder being diesel generation at Stornoway (see Chapter 11).

Next to water, the island's most readily available resource is its stifling blanket of peat, which covers more than 80 per cent of Lewis's land area. It has had a more than significant effect on the natural history of the area, its scenery and the human element. When the deposits were examined in varying detail in 1910-11, it was estimated that they covered no less than 230 square miles, in depths up to 16·5 ft; the average depth of peat over the whole island was assessed at 5 ft. On this basis the deposits would contain approximately 85 million tons of solids. A survey carried out by the Peat Section of the Department of Agriculture & Fisheries for Scotland in 1952 indicated that the earlier estimates were slightly high.

In 1946-7 the Ministry of Fuel & Power reconnoitred the peat deposits on both sides of the Stornoway-Barvas road and indicated that these were suitable for large-scale utilisation. Yet today, despite these Government-backed investigations, the peat deposits of Lewis are still used only for domestic fuel. One of the points made in a 1952 survey was that the area was generally firm enough to take the weight of various bog machines for digging and milling. Another point was that the calorific values of ten out of twelve peat samples were in excess of 10,000 BTU/lb.

CLIMATE

The rainfall has already been mentioned, averaging an annual 43 inches, according to readings taken at the Meteorological

be high until 1948. The year 1947 was the peak year for the production of Harris Tweed, with over 5,000,000 yards (of which 3,765,000 yards were stamped, and some 1,500,000 unstamped). In 1948 the production of unstamped tweed had fallen to 500,000 yards but stamped tweed came to 4,380,000 yards.

Then, in the year 1948 the imposition of a 66⅔ per cent purchase tax struck the industry a crippling blow. The rise in prices of wool increased difficulties, and by 1950 few orders were being booked and men were being paid off. A few small men who had relatively large stocks frozen by the purchase tax were able to sell them off, but this minor compensation for losses was short-lived. The outlook is disquieting.

(ii) *Agriculture, Peat-making and House-building*, 1938

(a) *Agriculture*.—The estimated agricultural output shows a total value of £189,100, and of this total the quantity fed to animals was valued at £103,000. This leaves £86,100 as the estimated value of crop produce consumed on the Island. Adding this figure to the gross livestock output we arrive at a total valuation of the agricultural production of Lewis of approximately £194,100. To arrive at the average output per croft there was deducted the farm production, estimated at $\frac{1}{10}$ of the total by calculation from known crop and stock returns. This gives a figure for crofts alone of £184,400. By dividing by 3750, we obtain an average value of the gross annual production by crofters as £49, or say £50. The inclusion of squatters' produce would add so slightly to the total figure as hardly to affect the average for rural households. Outlays being small, most of this net output may be regarded as 'net earnings'.

(*b*) *Peat*.—To this sum must be added firing and some share in housing. The peat cut has been valued at £90,000, an average of £24 per croft; it demands much labour. As peat is freely cut by cottars and squatters, etc. (estimated at 1050 or so), the average value might be given as £19 per rural household. In Stornoway the chief fuel is coal.

(*c*) *House-building*.—From 1920 to 1940 the Department of

373

365 company gave way to the North of Scotland Hydro-Electric Board.
*175 In that year there were 1,063 consumers, all within the Stornoway burgh boundaries. With its social remit, the board started on bringing power to rural areas, even where uneconomic. Lighting
[354] in the crofting townships was mostly by oil lamps, mainly the hot-mantle type (the 'Tilley'), but by 1960 the number of electricity consumers had reached 8,124, and the present number is about 96 per cent of the potential. Harris received its supply in
• 377 1954. The generating station is at Stornoway and employs diesel-
*175 engined units as prime movers, with an annual output of some 22,000,000 units. In August 1960 the Gisla scheme came into operation, the island's first hydro-electric plant; designed to produce some 2,000,000 units annually, it harnesses the waters of the Gisla River, which flows out of Loch Grunnabhat in the parish of Uig, Lewis. The station has a capacity of 540 kW. The other hydro-electric scheme is at Loch Chliostair in North Harris, planned to produce about 2,400,000 units annually.

312 The provision of water and drainage is still on the drawing boards for a number of crofting townships, though work is progressing for others. The Uig water scheme has cost some £100,000, a relatively large sum for a small population and amplified by similar work for drainage schemes. This scale of public expenditure must continue if people are to stay in their native villages and not migrate to Stornoway or leave the island altogether. Stornoway's new water scheme has cost something in the region of £160,000, but is vital if the town hopes to attract industry. The original burgh water supply was started in 1846 by Sir James Matheson and a few businessmen. The capital of the Stornoway Water Company was only £800, but it gave the town a gravity-feed supply from the nearby Loch Aridh na Lic long before many larger places on the mainland had considered such projects. Heavy floodstorms destroyed the old dam in 1933, and a new waterworks at Loch Mor a Starr was opened in 1937. As Stornoway extended the old loch had outlived its usefulness; for many years there had been difficulty in getting water to the higher parts of the town, particularly during the heavy fishing seasons when the fishermen drew off large quantities.

231 summer, were last used for cattle six to eight years ago by people in Brenish, but none are in use today. These shielings were at the western foot of Mealisval, only about a mile from the township. The Brenish 'distant' sheilings, about six miles to the south-east of the township across the mountains, were not used after about 1920, while the adjoining Islivig sheilings were last used in 1922. Mangersta may have had its original shielings to the east of Loch Melavat about a mile south of the township, but after obtaining the enlargement from Mealasta farm,until about 1939, sheilings were used in that area.

314 No peats are cut on the crofts; the peat-cutting areas for all three townships are near the road and in no case far from the township. The common pasture near the crofts bears
241 evidence of former cultivation, but it is at least fifty years ago since crops were grown on it. At this time the townships of Islivig and Brenish were over-populated with many cottars living on the crofts and all possible land on the crofts was already under cultivation. Today, less than half this 'old arable' is being cultivated, and in several cases the land is used solely for hay and grazing.

342 There are now no thatched houses inhabited in the townships and most houses have kitchen and other extensions added. Some crofters have built concrete two-storey byres
312 of modern design. In Brenish, where the hills to the east provide a good catchment area and the Brenish river a good source of supply, all the crofts have their own private piped water supplies, while in Islivig and Mangersta most crofts now have, or are getting, a
• 377 water supply. All croft houses are supplied with electricity from the grid.

226 Commercial fishing has long ceased and as there are only three boats there is now very
301 little fishing for domestic use, the principal use of the boats being to ferry sheep to the off-shore islands. Weaving is an important occupation. There are seventeen weavers -
286 nine in Brenish, two in Islivig and six in Mangersta, and during 1959 they were kept busy;
464 in 1958, however, few orders were received. Weaving cannot be said to bring in a steady
[304] income here, and some of the weavers, and others, find additional employment outside the township - this includes four men at the hydro-electric scheme at Gisla, three at Mangersta Ministry of Civil Aviation station, three at Aird R.A.F. station and at least
[467] one in the Glen Valtos quarries. In addition, one man owns a tractor which he hires
[442] out, and one, owning a lorry and van, does haulage work. Altogether, out of a total of twenty-seven men under sixty-five who do work, all but three (one just out of school and one a semi-invalid) have other employment in addition to their crofts.

162 The total population for the three townships is one hundred and twenty-one residents, and fourteen permanently away from home. Of the residents, twenty-eight (or 23%) are children of, or below, school age, forty-seven (39%) are in the 15 - 45 age group, 15 (12%) are in the 45 - 65 age group, and 31 (26%) are over 65. Of the resident tenants, thirteen are over 65, twelve under 45, and five between 45 and 65.

181 The relatively young population may help to account, together with the better soils, for this area giving an impression of a fairly prosperous crofting district compared with some of the others in Uig. Amalgamation of crofts into larger units has also gone further. The use of a tractor or horse for ploughing, extensive use of artificial fertilisers, the sowing of grass seeds and the sale of sheep for meat, all seem evidence of a group of people who are determined to make the most of their limited resources.

233 One enterprise, that of the Aird Bheag sheep farm, deserves special mention. Four crofters (three from Brenish and one from Islivig) have purchased from the Uig shooting estate about 2,000 acres of land on the Aird Bheag and Aird Moire peninsulas, five miles south of Mealasta. Here they are running a flock of about five hundred sheep. There is

233 hundred and thirteen - but most crofters had from forty-five to one hundred and twenty. Wedders are sold at two-three years old when the mutton is said to be at its best.

231 Parts of the common pasture - usually the machair, are set aside for wintering hogge but the usual practice is to keep as many as possible on the croft. The soum as a whole
[427] is not enforced but shares in the wintering parks are adhered to. For example:- Timsgarry Glebe is leased to Crowlista and one share entitles a crofter to winter twenty-five hogge on it. In Ardroil one share allows one cow or four yearlings or eight sheep or eight hogge
[232] on the machair - in practice it is the best hogge that are sent. The minister at Timsgarry who is much interested in sheep husbandry, has bred a heavier sheep with longer legs by crossing the Hebridean blackface with Swaledales and these seem to be doing very well; the minister is more attentive to his sheep than are many of the crofters, but some local crofters are showing interest in this crossbreed. The lambing percentage, so dependant upon the winter and spring weather, was about 80% in 1959 and this was regarded as good.*

Enquiries show that some crofts in each township far exceed their souming but because others carry no stock the four townships are understocked according to the total soum, here expressed in cow units. Sheep stocks in Timsgarry approximate to the sheep soum, Crowlista is overstocked by 130%, while the other townships are understocked.
[239] Some of the figures used for sheep stock were approximate or estimated. Nearly all crofts keep some poultry and surplus eggs may be sold to the grocery vans.

The rhythm of work on the croft during the year is shown on Figure 16, overleaf.[1]

241 Part of the hill common west of Crowlista was cultivated until the beginning of the
175 present century, at which time the township was overcrowded with two or three houses on
[361] each croft. A similar area west of Carnish was cultivated and old lazy beds, now grassed, are to be seen on slopes south of the road in Ardroil, in the valleys of Amhuinn Thoraghain and Allt a'Gharaidh and on the Borranish peninsula. The ruined shieling huts for this area, still to be seen around and beyond Loch Suainzval were in use until 1934 - '35. (Figure 5).

464 Ancillary employment is sought by all but nine of the thirty men under sixty-five in these townships and the wives of two of the 'full-time crofters' have regular employment.
228 There is no commerical fishing by local boats though the Bernera lobster boats are seen frequently off Uig Bay. The ruined curing house and piers at Crowlista, and the 'port' shown on the O.S. map near the site of the clachan in Carnish, point to the former importance of fishing.

288 At present the weaving of Harris tweed from yarn supplied by the Stornoway mills is more lucrative. There are two looms (plus one other weaver) in Carnish, two in Ardroil, three in Timsgarry and two (plus one other weaver) in Crowlista. All these looms were in use and two tweeds woven a week bring in a useful income but the supply of weaving is irregular. The future security of these weavers depends on the prosperity of the Harris tweed industry.

464 Mitchels's sand and gravel quarry at Carnish provides employment for from three to
[316] ten men. Five men from Ardroil and one from Carnish are employed there at present.
[312] The Aird R.A.F. station draws most of its civilian employees from Aird Uig but two
[377] Ardroil men work there. One Crowlista man is employed at the hydro-electric shceme
• [442] site at Gisla and this work will last for another year or two. Employers recognise the particular needs of their crofter employees and 'days off' are allowed for sheep fanks and other necessary work.

* The minister's ewes gave 103%.

1. [For Fig. 16, see page preceding p.38--Analyst]

23 There is no bull in Garynahine; the Department of Agriculture bull from Callanish is borrowed. Most crofters buy their milk either from the Admiral at the Lodge or from Stornoway whence a dairy delivers daily.

Eight crofters keep sheep; stocks vary between 5 and 30 per holding. Two crofters
233 exceed their souming (there is no equivalence in Garynahine because there has always been plenty of pasture). With a total of only 166 sheep and lambs on 1800 acres common pasture there is no danger of over-grazing.

312 The village has a good piped water supply from Loch Mhurchaidh, and has had elec-
377 tricity since 1954. There are excellent communications: 4 buses a day to Stornoway
111 and also one bus from Uig and one from Bernera passing through Garynahine. These good communications have probably contributed to the declining interest in crofting.

463 There are only three full-time crofters (two of whom draw war pensions). Of the remaining 12 adult men permanently resident, 10 have regular or part time work, the remaining two being to old. Employment is either in Stornoway or at the Lodge. Only
[178] two people do part time weaving. Crofting is rapidly decaying in Garynahine. The croft land is reverting to rough grazing, and there is no indication of renewed interest in the land. Instead, life is becoming increasingly orientated towards Stornoway.

CALLANISH by Anne Iredale and Jennifer Oxenbury

172 Callanish must be one of the original settlement sites of the Hebrides, as it boasts an impressive standing stone circle and two other groups of stones. The stone circle
133 is on a promontory, which projects into East Loch Roag. The promontory rises to about 125 ft, and then the land drops almost to sea-level at the neck (less than half a mile wide)
[361] which joins the promontory to the mainland. The township extends inland for about six miles in a belt roughly two miles wide. This inland area forms the common grazing; it is rough hummocky moorland with the general height rising gradually inland; the highest point is 425 ft.

175 The early crofts were situated close to the stone circle overlooking the Loch. The area was given to crofters who had been cleared from Linshader in the eighteenth century,
427 and it is said that until the Crofter's Act the Callanish crofters had to return to Linshader to work for one day a year in return for this grant of land. But later the crofts on the
34 more exposed westward facing side of the promontory were cleared and replaced by the 90 acre Callanish Farm. Some ruins of the croft houses still remain. The crofts then spread across the low lying neck to the main road from Stornoway to Breasclete, which now forms the boundary between the croftland and the common pasture. The croftland
241 varies in quality, but it is mainly quite good potential arable. Fertiliser and manure are extensively used. Seaweed was widely used in the past but in more recent years the labour of gathering the seaweed has been out-balanced by the lower price of the artificial fertiliser. The main problem of the crofters is one of drainage, and in some parts the drainage channels have to be as wide as the strips of cultivation. Croft 29, situated on a small peninsula from the neck of low lying land, is almost cut off from the mainland at high tide.

175 The croft houses were then in two nuclei; one on each side of the narrow neck. Much
361 later a third nuclei developed, known as Callanish New Park, further north along the Stornoway road, formed by evicted crofters from Bernera; they had put to sea in small
427 boats with their belongings, and they happened to land at this point. They first became squatters on the common grazing but later gained crofter status.

There are 47 crofts in Callanish which vary in size from 2 acres to 9.7 acres. Some
427 of the larger crofts are a result of private enterprise; the crofters have, without any
311

[TEXT CONTINUED ON PAGE 89]

[Cromore] [Marivig]

366 butchers' vans call on Wednesday and Friday and a fish van once or twice during the week. Goods
[494] are also conveyed by the daily bus. Electricity was brought to the village about four years ago
377 and the inhabitants now look forward to a supply of piped water in about two years' time. At present
[312] only three or four Houses have bathrooms.

The crofts, when worked well, are good enough to provide the existing population with a satis-
241 factory subsistence, but each family unit must have some additional source of income. It seems
434 that the recent subsidies for fishing are good enough to attract fishermen from Cromore and one or
[228] two boats might be sent out from the bay if the quay were longer. Weaving has brought prosperity
288 but, as the Park Association states in its Second Progress Report "there is not sufficient weaving available for the present number of weavers". The proposal to establish a spinning and processing plant in the Park District made in the 1957 Report, would undoubtedly be of great value to the
000 people of Cromore. The village is sited in a most picturesque spot and one of the inhabitants suggested that a hotel built on Crobeg Farm would bring some benefit to the community. However, even if these three increased sources of income became effective, one wonders whether they would be sufficient to attract the younger generation, already urbanised by schooldays spent in Stornoway.

MARIVIG

Pamela Gough, B. A.

131 Marivig is situated on the western and south-eastern sides of Loch Marivig, a small triangular sea loch opening to the north-east and sheltered from storms and swells by Torray Island, making the loch an ideal anchorage and harbour.

133 The land rises steeply from the shore of the loch for twenty-five feet to fifty feet, then slopes more gradually and irregularly, with frequent precipitous rock outcrops, for two hundred to five hundred yards to rise steeply to a line of low hills, two hundred and fifty feet to three hundred feet high, surrounding the loch. All crofts thus have an easterly or north-easterly aspect, not particularly favourable for agriculture, and only one has any appreciable area of level land
134 uninterrupted by rock outcrops. Soils, derived from glacial drift, are unevenly distributed, thin, and very stony, and cultivable areas are thus small and widely dispersed.

137 The surrounding hills, which form part of the eight hundred and sixty-three acres of common grazing, are mainly covered with heather, moor grass or sphagnum bog, while the lower areas within the township are grassy, but drainage is poor, and rushes are widespread. Bracken is not yet a problem, and only small areas exist, mainly on the lower slopes of the western side of the loch. A few rowans and willows survive here also, but otherwise the area is devoid of cover.

There are twenty-four registered crofts in Marivig, twenty-two being inhabited, one vacant
241 and worked by another crofter, and one worked from a house on the common. With the exception
692 of two crofts, one of which is on the common, all the boundaries run from the township dyke, which closely follows the two hundred foot contour, to the sea in radial fashion (Fig. 4). The size of the crofts varies from 1.25 acres to 22.25 acres but only seven crofts and less than four or more than eight acres in size. No croft has more than three acres of land which has ever been cultivated, and few now cultivate more than one acre. There are thirteen cottars and squatters, five houses being on the common, three of them cultivating small areas adjacent to their houses.

241 Cultivation is exclusively by spade on the 'lazy-bed' system. Owing to the rocky nature of the
[240] terrain, the 'lazy-beds' are narrow, often only one or two yards wide. Potatoes and oats are
246 grown in rotation, and hay taken from lazy beds left fallow. Very few crofters sow grass for hay
237 or undersow their crops. Dung and seaweed are used as fertilisers, with potato fertiliser as the
[824] most general 'artificial'. Small enclosed gardens, often somewhat neglected, produce lettuce, carrots, cabbage and soft fruits on about half the crofts, but no garden produce is marketed.

[Marivig]

231 There are only fifteen cows, two yearlings and four calves in the township, and the crofters no cow rely on neighbours, or on tins, for their milk supply. All but two of the crofters keep sheep, there being four hundred and eleven ewes, one hundred and eighty-five sheep and two hun and thirty-four lambs belonging to the township. The common grazing (including the off-shore islands which are grazed by five different crofters each year) is used for the sheep in summer,
[236] all but one of the crofters winter their sheep within the township dyke on the crofts. Most crofte keep hens, and surplus eggs are sold to the Stornoway vans.

314 Peats cut on the common are transported by lorry to the crofts, while peats from the north o
482 the peninsula separating Loch Marivig from the sea must be carried in creels.

228 Nearly every crofter owns a rowing dinghy which is moored in the loch off the end of his crof
501 and with this supplements the family food supply. One herring boat, operating nightly from Stor and returning to Marivig at weekends, is all that is left of a fairly large fleet which operated before the war. A second boat, unused for two years, lies shored up on the beach, and two othe are wrecks. Over fifty years ago there was a curing station at Marivig. One crofter fishes lobs during the winter and markets them in London.

463 Of the other crofters, only two supplement their incomes by weaving, one by working on the
464 roads while several men work partly on the crofts but are periodically away whaling in South Geo fishing, or on hydro-electric schemes. Several others are in the Merchant Navy. The gradual
466 migration from Marivig, especially of the young people, is reflected in the high average age of th
467 permanent residents, and in the numbers in the school - over one hundred pupils in 1900, thirty-n
462 (including sixteen from Calbost) in 1946; but only nine (none from Calbost) in 1958. The young
471 people leave the township to train or work on the mainland (generally in Glasgow) or in Stornoway while their elders accept the view that "there is nothing for the young people here".

205 The township has a Post Office and telephone kiosk which also serve Calbost, while lack of a
206 shop is partially compensated by a choice of four vans from Stornoway and one from Gravir. Th
466 is a daily bus from Gravir via Marivig to Stornoway and back: the return is over 10/-. The road
494 which reached the township from the west in the late 1920's has a tarred surface and is much
458 better than the later road southwards to Gravir which is untarred. There is no church in Marivig
491 and most of the population attend the Free Church in Gravir.
446

363 Within the township the two arms of the township road serve all but two of the crofts and the
361 sites of the newer houses, few of them more than thirty years old, tend to be near the road, whil the ruined houses found on most crofts are often nearer the sea. Only two thatched houses remai
342 and the other inhabited houses are built of stone roofed with asbestos slate, or of corrugated iron
377 All the crofts are supplied with electricity from the grid, but very few have a piped water supply;
312 rainwater is collected from the roofs and piped for washing, with a separate piped supply from a well for drinking. All other houses draw water from wells.

829 The stormy winter weather, rocky terrain and poor soil are all blamed by the residents for th drift of population away from the crofts, but those who remain have little incentive to work the
000 crofts more efficiently owing to the very hard labour involved. It is suggested that with more intensive cropping and more cattle, each croft could make a comfortable profit and surplus milk, potatoes and eggs could be marketed in Stornoway - the milk replacing that at present brought from the mainland. Such development, perhaps on a co-operative basis, together with a revival of the fishing industry and introduction of a tourist industry, by building a small hotel or guest house and attracting anglers as well as those who simply wanted scenic beauty, might bring prosperity back to a township which otherwise may well be derelict in the next twenty years. But the capital required for the two latter enterprises is not available within the township.

434 and the lack of a landing stage led to the decline of the industry in this township. Today there
435 one fishing boat which lands its catch in Stornoway: working with modern equipment, drift and
504 nets, it provides a regular income for a crew of six.

161 An examination of the population statistics proves interesting, especially when compared w
162 those for Orinsay. Lemreway's resident population of just over 70 males and 70 females is la
considering that there are six unoccupied crofts. Eleven of the crofts have more than one hou
and the cottar population forms over a third of the total residents. More than two-thirds of th
resident population is in the two important age groups - between 15 and 64. With over forty
resident males in the working age group, Lemreway provides a striking contrast to other crof
townships in Park.

463 Fourteen of these men are full-time croft workers, while nine others find work in ancillar
241 occupations such as weaving and fishing. A further eight supplement their croft work with rep
223 employment - a postmaster and a postman, a bus driver, a lorry driver and several weavers.
222 over thirty people work away from the township permanently, fourteen in the Merchant Navy a
205 nine girls in domestic service, while a further nine engage in seasonal work.
494

166 Emigration from the township has continued steadily with forty people leaving since 1939.
167 Nevertheless, Lemreway has a larger proportionate resident population than most townships.
505

351 Only four thatched houses are occupied and housing conditions generally are good. Every
342 has electricity, but, with four exceptions, water has to be carried from springs and wells. M
349 of the present houses were constructed in the 1930s and they are usually near to the road. R
312 of the old houses remain, some being used as byres, and these were built either along the sho
361 up the slope in the shelter of the hills, where the house was near the sheep, the peat and the s
491 Today supplies of food, peat and even seaweed are brought by road.

484 Mention must be made of the possibilities of the tourist trade in Lemreway with its most
attractive situation and reasonable road connections. An approach has been made to the Scott
Youth Hostels Association and while hostellers could not greatly increase the income of the re
they would stimulate interest in the area. Accommodation for summer visitors, other than re
485 of the crofters, is difficult to find but it seems that at least three houses could be used.

000 It is possible to be optimistic about the future of Lemreway, as at the moment considerabl
407 enterprise is being shown. A Ferguson tractor, bought this year by a man returning from wh
is an example. It is to be hired out and could be put to good use in some parts, especially on
311 outend. The attempt to improve the common pasture and the new extensions to neatly painted
242 all reflect a combined effort to improve conditions. The old economy of crofter-fisherman is
being adapted to modern times and crofter-weaver, crofter-postman and crofter-bus driver a
463 contemporary employment combinations.

181 The pessimism and apathy noticed in many crofters is to be found in Lemreway but above
is the impression of enterprise. If Lemreway can continue to adapt itself to changing conditio
000 it may be able to combat the 'drift to Glasgow' and continue as a successful community.

ORINSAY

Beth Blowers, Brenda Turner and John Wearmouth

131 Orinsay is a small crofting township clustered, in the form of a horseshoe, around the he
361 a sheltered bay on the northern side of Loch Shell. Most of the houses are situated within fif
241 of the shore on a narrow strip of level land, while the crofts extend from the shore on to the

1. The Directors of the Crofting Survey are grateful to Dr. F. Fraser Darling for granting
to the individual Township Cards, which are a storehouse of information. For detailed co
113 tents of the cards, see West Highland Survey p. 247.

TRADE AND INDUSTRY

286 462 *175 433 273 *175 433 [427] [438] womenfolk, giving a ratio of only one male weaver to fifty-five families. In Lewis, male weavers were more common: one to every twenty-five families. The making of whisky was introduced about the seventeenth century. This was in addition to the old drink of home-brewed beer or ale *(lionn)*, and much of it was made to pay rents; it must have consumed a considerable quantity of valuable foodstuff. However, the spread of distillation as a legitimate home industry by which the rent could be paid, in kind or by sale, was followed by legislation prohibiting all but very large stills; illegal distilling of course went on in a small way.

*175 511 It was, then, by a very narrow margin that subsistence was won in the island some two centuries ago. Many times famine showed how close was the wolf to the island doors. The introduction of the potato, and the interest in the fishing industry led to an increase in the population, though as discussed in Chapter 3 this in turn brought more problems. Basically, the island economy had never been organised on a sound foundation, with the result that winds of change blew where they would with little or no control.

*175 824 323 • 388 433 A new factor in the island economy was introduced after 1750. This was kelp-making, the cutting and burning of seaweed on the shore for subsequent use in the manufacture of alkali for the glass and soap industries. The first tentative move in the island was made by MacLeod of Harris in 1748, when he allowed some Irish labourers to make kelp on his shores; so little was the product's value realised at the time that he only charged them 2s per ton manufactured. As the burning of kelp came to be understood, and the marketable value of the product ascertained, the native population set to. Between 1772 and 1864, about 50 tons were produced in Lewis each year, compared with some 800 tons per annum in the Uists; the Harris figure was 500-600 tons. The growth of the industry began to snowball, and the Minister of Lochs, writing in the *Old Statistical Account*, states that at the time (1796) some 50 tons were being produced in that parish per annum. In Stornoway parish, though no figure is available, [221] the minister reports that kelp-burning was the principal manufacture, and that everyone able to fill a creel, or carry one, was employed at it for about three months of the year. Little of it seems to have been done in Barvas parish. The price of kelp varied

CROFTER INDUSTRIES

according to the amount of barilla (its great competitor, a carbon- *175 824 323 388 • 433 ate of soda made from plant ashes) which found its way into the British market. When the American war interfered with the imports the kelp price was as high as £22 per ton. Prices began to decline about 1810, and from 1822 successive reductions in duties on salt and barilla resulted in the decline and demise of the kelp industry. As a consequence great distress appeared in those districts which had founded their whole economy on seaweed.

The weeds of most value to the industry, because they yielded [137] most salts, included *laminaria digitata, laminaria bulbosa, ascophyllum nodosum* and *fucus serratus*. One ton of kelp yielded an average of 8 lb of iodine, with certain quantities of chloride of sodium, chloride of potassium, and carbonate of soda. When subjected to special treatment and distillation, 2-3 cwts of sulphate of ammonia, and several gallons of naphtha, paraffin oil, and volatile oil were also derived.

The fishing industry, discussed in the previous chapter, took *175 228 over where the kelp-making industry left off and became another king-pin in the island economy. By the end of the last century it seemed set fair for continuing prosperity. In 1900, harbours were [503] being planned and built with State aid in Uig, at Carloway, Ness [653] and Tarbert. Then 1914 came, and with it sweeping changes in international trade. Island fishermen were left workless with [511] wrecked and rotting fishing boats. In twenty years the number of Scotland's fishermen was halved; the remainder were all but ruined. The islanders' fate mirrored this pattern.

Yet another significant source of income for island families for *175 701 434 almost 200 years came from the men in military service, who either sent money home or returned home with their gratuities and pay. In the wars of the last century many enlisted in the Highland regiments, the Navy and the Merchant Marine. Even today, the income from this external activity is not insignificant.

EIGHTEENTH-CENTURY ECONOMY

*175 113 Information and statistics about the economy of the island in the middle of the eighteenth century are to be found in Walker's *Economical History of the Hebrides or Western Islands of Scot-*

3: Geddes K-4, 5 (1919-1952) 1955 ES10 Highland Scots
Lewis and Harris

000 landlords to improve passenger regulations at that time.

175 Wars brought enlistment in the Highland regiments,
162 the Navy and Merchant Marine. Owing to migrations of
all kinds, males came to be outnumbered by females, then
[702] as later (100 males to 114 females, 1931).[1] In Lewis in
[167] 1795 the proportion was 100 to 111, and in Harris 100 to
124. From this period onwards the 'export of men' con-
175 tinued, modified by the reserve for war. Men were trained
162 for the Naval Reserve and Militia; and in 1900 for instance
800 men were training at Fort George and 2500 sailors
702 were in the Reserve. The maintenance of a reserve for the
Navy was one of the strongest pleas for the framing of the
Crofters Act.

175 A new resource, important to the Islanders after 1750,
824 was kelp-making, the cutting and burning of seaweed upon
the shore, for use in the manufacture of alkali in the glass
323 and soap industries. From 1770 onwards the price rose,
• 388 heightened first by an import duty, then by the Napoleonic
Wars. Estimating from the high prices, averaging over
175 £10 per ton from 1800 to 1823, Sir John Sinclair put the
824 value of the annual produce (20,000 tons) at £200,000. "It
435 may appear surprising", he remarks, "how that sum could
be of such importance to 80,000 people"; but he goes
on to point out that this gave the additional cash needed
to supplement their subsistence. But even when Sinclair
wrote in 1825, the industry was in peril. Failure and loss
occurred almost immediately after, with disastrous effect.

175 It is complained in the *New Statistical Account* that
433 owing to the summer-time work of kelp-making up to
1830, the people could give little attention to the crofts, so
[511] that their extension must almost have ceased. Nor could

[1] In 1951 the ratio in Lewis was 100 males to 112 females, and in Harris, 100 to 110.

THE LEWIS CHEMICAL WORKS

he Lewis Chemical Works

But it must at least be recorded that he made the first-ever 382 • ttempts at introducing a true industrial activity on a large scale: 175*
ne Lewis Chemical Works, which cost him some £33,000. The asis of the enterprise was the real possibility of turning the Lewis eat bogs into oil. The idea was sound enough, but incompetent nanagement killed it off; its death was hastened with the dis-overy of natural oils in America and in the Middle East.

An experimental plant was built near Lews Castle. Another vas erected on the banks of the River Creed, and to protect the almon for which this river is famous, Matheson had to spend onsiderable sums in trying to keep the discharge effluent out of ne waters. A third distillation plant was erected, this time well way from the Castle grounds. A kiln was built, elaborate con-ensers were fitted up, peat was cut and stacked, and a canal, hree-quarters of a mile long, was cut to convey the peat to the lant. Troubles were considerable, despite the efforts of a chemist rought by Matheson from London. In time, the plant began to roduce. Each working day of twenty-four hours, about 18 tons f peat were used in the kilns; another 3½ tons were used to fire ne boilers. The recovery figure of crude hydrocarbons was around per cent.

With reasonable success in sight, work was put in hand for the uilding of tramways across the peat bogs so that the material ould be obtained from a greater area. Also, a refining plant was uilt at Garrabost, eight miles away from the distilling plant, hich added greatly to costs and increased the inconvenience so ar as managing the plant was concerned. For some ten years, the ewis Chemical Works produced quite valuable products. One f the first, which found a good market, was a lubricant for wagon xles and heavy machinery; within a short time of its introduction ne demand exceeded the supply. But, instead of increasing pro-uction, the management authorised the addition of water to a [439] -ton consignment for Glasgow to fulfill a rush order. It came ack by the next steamer; and further orders for it dwindled to othing.

It was a ship's captain who discovered that the peat tar was n excellent anti-fouling grease for ships' bottoms. Samples were

TRADE AND INDUSTRY

• 382 *175 sent to several shipping ports, and the response was good; one Liverpool chandler even offered to take the whole output at a good price. But again the product was rendered useless, this time by being subjected to a partial-distillation process, in the thought that this would improve it; orders stopped. One shale-oil firm offered to take the crude peat tar to refine along with its own products for the purpose of modifying the flash-point of the oil it was itself manufacturing. Most commercial enterprises would have jumped at the chance of disposing of their output without the need for the always-tricky refining process, but here personal interests intervened and another avenue of profit was blocked.

The Lewis Chemical Works had by this time become something of a showpiece, chemists and scientists mecca-ing their way to Stornoway to see both plant and product. One eminent chemist pronounced the plant one of the most successful ever erected for the distillation of hydrocarbon oils from peat, and an Irishman said that if the Irish Peat Company's installation had been as successful as the Lewis counterpart, Ireland would have been enriched by her peat bogs. By the middle of the 1860s a ton of peat tar was being produced for 70s, as against 100s for unrefined shale oil. Peat oil sold at first at 2s 9d per gallon, then dropped to [435] 2s 6d and finally to 2s, presumably as the American oil products were reaching the market. The writing was on the wall. Sir James Matheson, realising too late that perhaps a closer control should have been applied to the venture from the beginning, decided to cut his losses and close the works. All the metal—condensers, pumps, stills, pipes, and tanks—was broken up and sold for scrap. Nearly four miles of light railway had been laid from the Creed Works to the peat bogs; this was lifted for scrap. So ended the first phase of industrial Lewis. The venture proved, however, that with adequate skill and knowledge success could be grasped.

Bricks, printing, whisky

339 *175 The brickworks which Matheson built for £6,000 at Garrabost produced building materials and some fine examples of drain-
396 *175 ing tiles, but has now disappeared. The Patent Slip built at Stornoway for another £6,000 was able to take ships of up to

[TEXT CONTINUED ON PAGE 127]

island; but islands in isolation must carry a population of suitable numbers and age structure before they can support even a minimum of amenities. In the Western Isles, Stornoway used to be the only community to have a semblance of the services taken for granted in similar towns on the British mainland. The elements of commerce, industry, education and religion were established there initially, to spread with characteristic slowness first to the immediately accessible areas and then to remoter regions. Though many parts of the island are now at least within practicable travelling distance of the social and public services expected in urban communities, some townships have yet to see one or another of them within their own boundaries. 36

The Stornoway Gas Light Company was formed in 1840 by Sir James Matheson, with a capital of £350. The plant consisted of one horizontal retort which produced about 1,000,000 cu ft of gas annually. The old buildings still stand, and the plant now has three vertical retorts with an annual production of just over 40,000,000 cu ft. Rural areas use Calor gas, introduced to the island in 1935. 373 382

The public electricity supply has of course made the greatest impact on the island as a whole. Electricity was known in the island long before the public supply arrived, generated privately by individuals, hotel concerns or public authorities. One of the first plants of significance was installed in the second municipal building in Stornoway (the first, built in 1905, was destroyed by fire in 1918), and was driven by a gas engine. In 1919 Lord Leverhulme installed an electricity plant in Lews Castle, which also had a private intercommunication system. While this work was being done Leverhulme proposed to give electric lighting to the town. Other buildings with their own plant included the hospitals and the mills, which were turning to electric motors for driving their line shafting, the power take-off for spinning and carding machinery. 365 175*

In 1929 an electricity supply company, with a capital of £12,000 was proposed, the Stornoway Electric Supply Company being registered in 1932. Its financial fortunes were chequered, though revenue was rising slightly by the time the second world war began. In 1948, on nationalisation of electricity supplies, the

231 Recent trends also point to a decline in the numbers of sheep, although more are kept now than
288 fifteen years ago. From 1942-51 the numbers were more than doubled (263-565). A great deal of this increase must have been a result of the ewe subsidy, but part at least may be connected with the war and post-war boom in Harris tweed. By 1955, when the subsidy was suspended, numbers had already begun to decline and have since fallen steadily. This year the township has only 374 breeding ewes while the rearing of only 236 lambs would suggest a further decrease in the future.

221 All the crofters keep some sheep although individual stocks vary from 15 to 150. For most of
233 the year these sheep are grazed on the common pasture on the moor or on the eighteen acre island in the bay. In August, however, the lambs are gathered in for weaning and dipping; in November the gates are opened and all the sheep allowed to graze on the cleaner pasture within the croft boundaries. If necessary they are given fodder, but from the beginning of January they are encourged to return to the moor, although the gates are not 'officially' closed until May.

311 The total area of the common pasture exceeds 1500 acres, but most of this consists of hummocl
233 waterlogged peat moorland supporting only poor quality coarse grasses and sedges. Over 700 sheep now graze this area and the apparently large common pasture is in reality drastically overstocked, a process which must inevitably harm the animals as well as the land.

231 No pigs or horses are to be found in the township and each crofter keeps very few hens, normal
235 just sufficient to provide eggs for home consumption. Any surplus eggs which do remain are sold
435 to the Co-operative van, but prices are so low that the keeping of more than a dozen hens is far from profitable.

434 It can be appreciated that crofts of this size and quality can neither provide the crofter and his
464 family with sufficient income, nor fully occupy the available labour force. As a result, people
228 in the past have turned to the sea. Indeed the West Highland Survey describes Orinsay as "primari a fishing township". Today the herring fishing has disappeared entirely and only one crofter still does a little lobster fishing, sending his catch direct to Billingsgate.

161 There are now 45 people resident in Orinsay but an examination of their ages reveals that less
162 than half of them are between 15 and 64 years. Indeed there are only six resident males between these ages, and three of these spend at least part of their time working away from the township on the Eishken estate.

366 As there is neither a school, post office, shop nor garage in Orinsay, there is no available
368 occupation in the 'service trades'. Therefore, over half of the males between the ages of 15 and 44
166 are permanently away in the Merchant Navy, returning home only for holidays, while another third
167 are seasonally away with the whalers. Similarly almost half of the females of similar age work in
464 domestic service in Glasgow. It must be realised that most of these people working away assist
505 their families at home, and that a large part of the croft incomes are made up of money sent home,
228 together with pensions and other allowances. Emigration from Orinsay to other areas has continue
462 steadily, twenty people leaving the township since the war.
357
454

On the whole, housing conditions are good, due to relatively recent construction. There is
492 only one traditional black-house, and even this house has electricity: only one house is without it.
373 Water supply is not so certain as wells and springs are the only source. The township lacks a
208 telephone and a shop, but is served by travelling vans. A good road, constructed within the last
366 decade, connects Orinsay with Gravir; entering the township via the valley to the north-east, it
491 serves directly all but three of the crofts. A bus leaves daily for Stornoway, about thirty miles
494 distant.

161 Like so many other crofting townships Orinsay, above all else, gives an impression of con-
162 gestion. The self-same hills that provide shelter also restrict cultivation. The crux of the situation is that land, extremely marginal in character, is being worked by too many tenants on holdings too small to be economic. With three residents to every two acres of cultivated land, Orinsay must be seen as an 'overspill' - an unfortunate result of the cottar problem in the 'twenties

381

381 CHEMICAL ENGINEERING--industrial chemistry; research laboratories, equipment, and techniques; specialized personnel (e.g., technicians, engineers); special chemical industries not classifiable in the succeeding categories (e.g., adhesive manufacture) including products and their uses; etc.

288 175 441 286 236 438 175 [386] developed from the concentration of power in the hands of the merchants. In the early days of the industry, all the processes involved in the production of a finished length of tweed were carried out by individual families. A man used wool from his own flock, and with the aid of other family members, dyed it with vegetable dyes, carded and spun it by hand, wove it, washed and shrunk it, and found his own buyer. Dyeing wool, spinning yarn, and washing ("waulking") the finished length of tweed was usually done by women. In Harris, the entire process of producing a tweed was carried out by women, but in Lewis the weaving was done largely by men.

286 236 175 462

175 286 A woman in her 80's recalls the process of weaving when she was young. Hand-spinning had died out by this time, although the question of whether tweeds woven with such yarn could legitimately be called Harris Tweed was not resolved until 1934.

175 283 [435] [433] [384] [824] "About 1916 or so it took about two weeks to a month to do a tweed. You bought the wool from the Agricultural Board. Sixteen bags of wool, costing about L20, would do four tweeds. You needed four one-stone bags per tweed. Then you would spend a day gathering a bag of crotal (lichen scraped from rocks and used for dye). One bag per one bag of wool was required for the dye. After

175 283 175 286 [462] dyeing the wool it was spread out, dried and sent to Stornoway to be made into yarn. The yarn was then sent back, and the weaver wove and washed it. About six women were required to do the waulking (the process by which the cloth was washed and shrunk).

175 286 432 "In those days the weavers designed their own patterns, and sold their own finished tweeds. I remember going into town with my brother, we had two tweeds in the cart. We went into a shop to sell the tweed, and the man said it was poor weaving. He didn't want to pay the full price for it. I told my brother to roll it back up, we would take it somewhere else. As we left the shop, he told me I had 'good cheek.' In the next shop the merchant didn't say anything, and gave my brother the regular price. We went home with L60."

286 288 175 178 [433] [434] [463] [386] [236] [283] The great demand for tweed encouraged the development of more efficient methods of production. One by one the various processes of production were taken over by specialists, and gradually these specialists were brought together under one roof. Large boilers for dyeing wool were supplied as a result of actions taken by the Congested Districts Board, which was formed in 1897. The Scottish Home Industries provided chemical dyes. The most difficult and time-consuming processes were carding and spinning, which small mills on the mainland began to do

Lewis and Harris

A HARRIS VIGNETTE

621 631 has direct or indirect communication with Glasgow, Stornoway and North Uist. In summer a thrice-daily bus runs to Stornoway, [505] and once a day a bus makes the round trip of East and West [494] Harris. The township, linear in pattern, east to west, includes sixteen shops which cater for most of the needs of the population [361] within reasonable travelling distance; it also has two cafés, a [366] post office, a licensed hotel, a hall for social functions, a [368] masonic hall and two churches. The Sir E. Scott School here is [873] the only secondary school in Harris with an academic stream. Most of the working population is employed in the service industries, the professions and the tweed industry. Tarbert was a [504] fishing port of some significance in the past, and is now a refuelling point for ships.

464 The absence of organised industry on a large scale, such as [167] Lewis has, is a factor which tends to bring nearer to reality any desire on the part of Harris natives to leave their native soil. There are small pockets of industry, but these are only dabs of easing 463 ointment on the excessive unemployment sore of 27 per cent. The [241] main occupation is of course crofting, the income from it being augmented from a variety of sources. Some crofters concentrate [434] on the production of Harris Tweed, perhaps using the wool from [286] their own sheep; the natural dyes from the lichens which grow on the rocks and from other plants are still used occasionally. [386] Others specialise in knitwear. Recently shell-craft and wood-turning have been added to the traditional crafts, with a view to the [226] tourist market. Fishing, of course, plays a part in the economy in some communities. The interest of such organisations as the Scottish Country Industries Development Trust has been concentrated on the potential in shell-fish processing, and the production of knitwear on a larger scale than exists at present. Road- [464] work gives employment to about thirty men, but is of course seasonal.

316 An apparently bright light on the employment horizon showed itself in 1965, with the opening of a quarry at Lingerbay. The mineral quarried was anorthosite, a white granite used as an abrasive in cleaning products. A 99-year lease was taken out by a subsidiary company of William Robertson (Shipowners) Limited, Glasgow. But the quarry was closed in 1967 due to lack of orders.

388

and its subsequent use in the glass and

LORD LEVERHULME'S FISHERIES

When he pulled out of Lewis to go south to Harris, he offered—such was the character of the man—as thanks for the '98 per cent support' he got from the people of Lewis, to each Lewis crofter his own croft as a free gift, and the Lews Castle, together with all his property in Stornoway, to the people of the town.

In 1919, Leverhulme became proprietor of Harris, and concentrated his efforts in Obbe, now called Leverburgh, in South Harris. The harbour at Obbe lacked the natural advantage which Stornoway had, so he spent large sums on making it navigable. Rocky obstacles were blasted away; numerous buoys and beacons were set up to guide vessels into harbour; new quays were built; and kippering sheds, and other buildings necessary for packing and curing herring were erected. Among his other undertakings in Harris were the provision of a mill for making tweeds, and he bore half the cost of the 5½ miles of road between Leverburgh and Finsbay. In 1925, after a visit to the Congo, he died in Brussels. His Harris schemes came to an abrupt end. And the remains of industrial history are still to be seen in the quietness of the little township named after one of the most stormy of business petrels that Britain has ever seen.

Tourism

Tourism has always been a perfunctory and casual affair, until the introduction of the fast ferries which now link the mainland (via Skye) with the Outer Isles. Some 10,000 cars cross each year from Skye to the Hebrides. In 1913, the Stornoway Tourist Association had a struggle to increase the number of visitors to the town, to establish it as a tourist resort. It is much the same today with the Western Isles Tourist Association, which is having difficulty in integrating tourist facilities with crofting activities. In Lewis, the Stornoway Trust has assisted in establishing pony-trekking, a venture which has the potential to mirror the success of a similar one in the Isle of Skye.

PRESENT INDUSTRY

Almost an echo of the kelp-burning industry is the alginate industry. It provides employment for only small numbers, but is a

RADE AND INDUSTRY

ful crofting ancillary which, unlike many others, is soundly ed on a definite commercial demand. Various industries use extracted acid for some 150 products. The Scottish alginate ustry, the second largest in the world, is based on the process E. C. Stanford, who discovered alginic acid in 1883, though ay modern methods are used. For raw materials it has turned the old kelping shores of the Hebrides and Northern Isles. On island it has a factory at Keose on Loch Erisort, a site chosen the easy access afforded to puffers; the factory receives the ed, dries, mills and bags it, and the boats then carry 200-ton ds to Girvan. The factory itself involved some £30,000 of ital layout and has a capacity of 120 wet tons per week—4 tons producing 1 dry milled ton. About a dozen Harris and wis crofters gather the seaweed crop, the most useful type being dderwrack or rockweed *(ascophyllum nodosum)*, from the res at Loch Erisort, East Loch Roag and Bernera in Lewis, sinish and Scarp in Harris, and Loc Seaforth. Where there is d access the weed is cut by sickle and loaded into a lorry, but re often it is cut at low water to be floated with the incoming e and rafted to Keose, hauled by motor boat.

A product of the land not readily associated with the Hebrides bulbs. Bulb-growing deserves a mention, however, if only be-se the experiment to see whether it could become a commer-l possibility in Lewis was carried out by the children of Lionel ess) Junior Secondary School. The MacAulay (Rhodesia) Trust de an investment of £150 to cover initial expenses, and success owed. When the original project was completed it was ex-ded, sales bringing the school a useful sum. But an attack of ease brought production to a standstill in 1966.

Another small industry is the aerated-water plant at Ness, ich is operating with reasonable success, and could do better if ports of aerated waters from abroad were reduced. A number recent surveys made in the island have found great interest in h activities as shell-fish processing in Harris to produce semi-serves, using mostly cockles and mussels. Local knitting already a name for its products and a potential for extension on a nmercial scale; this latter began in late 1966. Some forty years knitting specialists went to Lewis to investigate the possibilities

382

382 PETROLEUM AND COAL PRODUCTS INDUSTRIES--refining and processing of petroleum; manufacture of coal products (e.g., illuminating gas, coal tar); use of special apparatus and machinery; processing techniques; products and their uses; economic importance of petroleum and coal products industries; organization of labor and production; etc. See also:

Oil and gas wells and pipelines 315
Coal mines 316
Heating and lighting systems 354
Thermal power 375
Refining machinery 402
Plumbing fixtures 414
Filling stations 495

175 [161] Around this time, various factors had encouraged an increase in population. After Scotland's union with England in 1707, the prohibition on the import of cattle into England was lifted, and trade in cattle became economically more important (Day 1918: 26). The numerous wars of this period caused the price of cattle to double between 1736 and 1766 (Day 1918: 180). Clan warfare diminished; the potato was introduced; and vaccine for smallpox became available.

175 161 The increase in population led to an extreme crowding of land in some areas, which made agricultural [166] reform difficult. Many landlords tried to encourage tenants of their estates to emigrate. The appearance of a market for kelp, which lasted from the middle of the 18th century to about 1815, discouraged landlords from implementing policies of depopulation that would 175 diminish their labor force. An alkaline extract of 824 kelp was used in a variety of manufactured goods, such 323 as soap and glass. The seaweed was gathered by men, 388 women and children living along the coasts, and burned in rough open kilns. Tenants who worked at this [465] occupation received L3-4, and the landlords L18-20, per ton (Mackinlay 1878: vii); the landlord received as high an income as L10,000 to L20,000 a year from the burning of kelp (Gray 1957: 42).

PRESENT INDUSTRY

f a knitting industry based on the crofters, who would use Lewis 286
arn and produce knitwear in addition to their woven fabrics. 175*
However, it was found that the yarns used for Harris Tweed were
nsuitable for knitwear, not being given sufficient twist in the
pinning: before women use this tweed yarn for knitting, it is
ommon practice to twist two or more threads of yarn together on
hand spinning-wheel.

Little in the way of craft work is done on the island, mainly 463
ecause of the lack of indigenous materials which could be used
o produce typically-island items. Marram-grass has been sug- [137]
ested as being suitable for making agricultural wind-breaks, and
lose-woven basket-work. Shore-stones and pebbles are plentiful [135]
oth in quantity and variety of type and colour.

Small employment outlets on the island are marine and motor 396 •
ngineering, mainly based on Stornoway, and boat-building. This [464]
atter is a small but socially-significant firm in Ness with products
vith a high reputation. Construction and general building is of
ome significance, one of the most enterprising firms being built
p literally from scratch so as to become a highly-successful
sland business.

he unemployment problem

The island's unemployment problem is as much a matter of 464
oncern today as it has ever been, averaging about 25 per cent
nnually (representing well over 1,000 people) compared with the
cottish mainland figure of 6.0 per cent; the contemporary figure
or Britain is around 3.0 per cent. While unemployment as it 464
ffects adults is serious enough, unemployment among teenagers 883
hreatens the community's whole future. The island has its Youth
mployment Officer, who has an unenviable task. Each junior
nd secondary school in the island is visited to interview school-
avers, at least once a year; employment advice is given and this
supplemented by Careers Officers' visits.

Such employment openings as exist over the island's limited
ectrum are concentrated in Stornoway. They are, however, [462]
ainly in shop work, mill work and hotel work for girls, with a
w vacancies for apprentices in trades generally associated with
uilding construction. Most of the jobs offered are very much in

STORNOWAY

The previous
*175 building was only an idea in 1897; it took
632 shape when Dr Andrew Carnegie offered to contribute £1,000
217 towards the construction of a library, provided the town adopted the Public Libraries Act. This was done, and the Council decided to incorporate the library into a larger structure, erected at a cost of £11,000 and opened in September 1905 by Lord Roseberry. Carnegie increased his contribution to £3,500, with other large donations from public-spirited industrialists of the time (eg Coats of Paisley, who also financed school libraries in the island).

*175 Being a seaport, the sea has been basic to the town's livelihood.
632 In the eighteenth century trade flourished between Stornoway
504 and the Baltic, Scandinavia, Holland, France and the north of
439 Ireland; and in the first half of the nineteenth century, fish was exported as far away as ports on the Mediterranean. The advent
*175 of steam killed the Stornoway sailing craft. At one time in its
• 396 history, the shipyard (at Matheson's Patent Slip, now the site of
632 the textile mill) turned out many fine vessels. The scent of tar and pitch, the crunch of a busy grindstone, the shaping of a ship's timbers, the steaming of her planks, the driving of pins and bolts, the music of mallet and caulking-iron, the buzz from the saw-pits and the riggers aloft, all gave the town a sense of at-one-ness with the waters in the bay. Then there were the schooners, brigs and barques of foreigners who put in for repairs or for merchandise. It was a time of glory that has now gone as surely as the sail has disappeared from the high seas. Ship-masters, ship-owners and
[162] sailors all added colour and variety in the streets as they mingled with the local population—which numbered 1,000 in 1801. Stornoway captains were world-known for their skippering: MacLeods, MacIvers, MacKenzies, Ryries, MacLeans, Morisons, Allans. These were the names that were once reeled off to be paired with the famous ships of the day: *Sir Launcelot, D. L. MacKenzie*, and *Assaye*.

*175 While large numbers of its sons were sailing the high seas, many
504 in ships of Stornoway origin, the town began to take on the first
632 look of a port, with piers. On 9 August 1864, Sir James Matheson subscribed the instrument which took the Stornoway Harbour Commission into being. The following year, on 29 June 1865, the
[503] Commission was incorporated by Act of Parliament. Matheson had shown a great interest in the development of the existing

402

402 INDUSTRIAL MACHINERY--power generating machines (e.g., steam engines, turbines, windmills); machine tools (e.g., lathes, planing and stamping machines); typesetting, printing, and bookbinding machines; mining, lumbering, and drilling machinery; stone crushers; pile drivers; milling and refining machinery; spinning and weaving machinery; canning, bottling, and packaging machinery; machines for processing leather, paper, chemicals, and other industrial materials; etc. See also:

Power . . . . . 37 Description of hand looms 286
Transportation machines . . . . . 49, 50 Hydraulic engines 376

175 behind the tweed's popularity. The tweed was more than
286 a cloth; it was peat smoke and windswept moorland, the
288 [828] image of the free man who had escaped city life and machines and was the master of his own destiny. Steps had been taken all along the way to preserve the image of home-crafted goods, as when, in an effort to prevent machine-spinning, carding mills were built in Lewis and Harris at the turn of the century to prevent wool from being sent to mills on the mainland, where it was both [685] carded and spun. As early as 1906, a man was convicted in London of selling power-loomed tweed under the name
288 "Harris Tweed." Today power-driven looms can produce
• 402 double-width cloth 54 inches wide, a width much preferred to the 28-inch cloth produced on the Hattersley loom because there is less waste when the cloth is cut. But because "Harris Tweed" must be hand-woven, new looms of light-weight metal are being designed on which double- [435] width cloth can be hand-woven. The new looms will cost so much that many weavers say they would be unlikely to invest in them, especially given the uncertain future of the industry.

175 The Harris Tweed Association, formed in 1909, was
178 granted a certification mark by the Board of Trade which
288 was stamped on tweeds that were hand-spun and hand-woven
44 in the islands. During World War I, hand-spinning died
[424]
[286]

288 Questions about the state of
59 "the tweed" permeate all discussions, and often
458 constitute an initial greeting. "Have you got a
[524] tweed in the loom? How many do you have? Did you
[676] see Stickey's tweed van going into Pairc? Did you hear that Newalls has an order for about 800 pieces...?"

"The mills brought me two tweeds, and I got two in town myself. I stuck those two in the attic so that anyone who came in would be none the wiser," says one person in a whisper. Neighbors are in and out of each others' houses and loomsheds, observant and questioning, on the lookout for any indication that they have missed out on some transaction in the competition for scarce goods.

D. Weaving as Strategy

286 When weaving was done on a wooden hand loom, the
178 weaver required a longer period of apprenticeship.
• 402 Weaving was "more of an art," as some of the older weavers remember it today. Not only was the shuttle thrown back and forth by hand, but the lifting of different threads in the warp was done by manipulating
288 four foot pedals in the correct order. Today, the
178 process of weaving is very much simplified: the weaver
402 pushes only two foot pedals, and simply keeps an eye on

288 the automatic shuttle; all other processes have been
178 built into the design of the Hattersley loom (cf.
• 402 Thomson 1969). In other words, weaving does not entail
288 very specialized skills and is not difficult to learn.
463 A sailor can come home and learn to weave in a short period of time, or pick up the trade again with ease after having been absent from the loom for a long time. [671] Neighbors substitute for each other when someone is ill if a tweed is "urgent." Wives help their husbands, and [593] young boys their fathers and uncles. Such low-level specialization and substitutability are complementary to crofting activities and the maintenance of neighborhood ties, and may be seen to favor continuance of the occupation of weaving.

874 The Lews Castle College in Stornoway, established
286 as a technical college in 1953 in a building that was
[467] formerly the home of Sir James Matheson, offers training courses in weaving for adults which last for ten weeks and qualify a person for membership in the Weavers Union (cf. Stornoway Gazette, March 16, 1968). The [872] college also sends weaving instructors to all the public schools on the island to instruct young boys in the
654 rudiments of weaving. The Highlands and Islands
286 Development Board have in the past offered loans and
288 grants with which to purchase looms, and government aid has protected the mills.

Park

[Lemreway]

157 vulgaris is dominant. Ling, which can tolerate considerable soil water, often occurs with Nardus, Molinia, Scirpus caespitosus and Eriophorium. A few rowans, usually near the shore, and a few willows, usually within stone enclosures, are the only trees to be seen.

201 Of the thirty-three legal crofts in Lemreway, nine comprise less than five acres, while seventeen
203 are between five and ten acres. Of the remainder, only two exceed fifteen acres and one of these is 30 acres. Six unoccupied crofts are worked by persons other than their tenants, so actually the 290 acres of croft land are shared by twenty-seven holdings. The seventeen-acre 'outend' was originally divided between fifteen tenants but confused sub-letting has resulted in four separate holdings directly occupying nine acres, and working another four acres. Thus the outend today must be regarded as the monopoly of four 'unofficial' holders.

204 Little more than a quarter of the croft land is cultivable and even less is actually cultivated
241 today: Figure 9 illustrates the crofting year. The broken terrain and the stony nature of the soil has permitted the cultivation of tiny 'lazybeds' and the total cultivated area is now about 48 acres. Only the strips of land on the gentler slopes, where the soils are deeper, are now cultivated, but every croft shows signs of former, more extensive, lazybed cultivation, often covering at least two acres. For example, on the east side, natural hay is cut on the well-marked lazybeds at about 225 feet.

209 Oats and potatoes, 29.5 and 16 acres respectively, occupy almost all of the cultivated ground.
206 Most crofts grow about half an acre of potatoes and one acre of oats; both acreages have declined, the former with a declining population and the latter with a reduction in the numbers of cattle; hay has increased in importance. No bere is now grown, though before 1900 it was preferred to oats. Ruins of the bere mill, which ceased to function at the beginning of the century, can still be seen. Fifty-nine acres of natural grass are cut for hay but only four crofters had sown grass for hay in 1958, about three acres in all. Few vegetables other than potatoes are grown though carrots are said to grow well, and formerly turnips and cabbages were grown. The soil needs careful preparatio
291 to be productive and almost every crofter used some seaweed and at least twenty drew subsidies for i
[228] and artificial fertilisers in 1958.

281 Stock totals have declined recently but the township has 36 cows and 22 calves. Only one croft
[259] is without cattle and 22 of the 33 working units have a cow and a calf. The township has an Ayrshire bull on loan from the Department of Agriculture; one of the few remaining elements of the co-operati township system is that this animal is fed by the crofters, in rotation, during the winter.

All but two crofters keep sheep; stocks vary between ten and 120 per holding but the majority have about 23 ewes with ten lambs. Although numbers have declined recently, the 3,025 acres of very moderate common pasture support a flock of about 1,150 sheep, including about 650 breeding ewes and about 300 lambs.

255 The souming is not enforced in Lemreway and it is remarkable that the total stock tallies almost exactly to the souming. An examination of the sheep soum reveals that the stock of 917 (excluding lambs) considerably exceeds the sheep soum of 626. It is interesting that it is nearly always the working units of over 10 acres that are overstocked; of twelve such units, eight keep more sheep tha they are entitled to. Most of these crofts are grouped on the eastern side of the township where the crofts have a larger outrun.

211 Thus, while overgrazing is not so severe as in many townships, it represents a potential threat,
242 particularly if the common pasture is not improved. However, in 1958 ten acres of the common pasture have been enclosed and re-seeded. Six acres were sown with ordinary mixed grass seed, two acres with pelletted seed and two acres with pelletted and inoculated seed. The eleven crofters taking part in the scheme put on 100 tons of sand to help drain and aerate the peaty soil, 2½ tons of ground mineral phosphate and 2 tons of concentrated compound fertiliser, grades 1 and 2 - all of it by hand. The area was sown in May 1958: by the following August, there was a striking difference between it and the untreated pasture. Next Spring, eleven cows will be grazed on this area. With th success of this scheme, it is hoped that more of the crofters will co-operate in re-seeding further areas.

632 distinctive geographical features, and nearness to the
363 sea: Ceann a Stigh (or Ceann a Stigh Bhaile, or Baile
103 Stigh, the "town" at the "head" of the road "in" by the sea), Buailebhir (an area identified with the keeping of cattle), Gearraidh Mor, Creagan, Pluic, and Mach a Chul ("out the back," by a road built relatively recently). A street which leaves the main road and cuts into the moor, or common grazing land, is called Grinnbhat, from the name of a nearby loch.

511 The presence of a large Harris Tweed mill in
[348] Shawbost has contributed to a high standard of living
[288] within the village. It is estimated that only 25% of
[493] the households of rural Lewis have cars; about 50% of the households in Shawbost possess them. In 1970
[342] Shawbost had only one occupied tigh dubh, or "black house" built of dry stone and roofed with thatch, which to many islanders symbolizes a past life of poverty and
• [404] adverse times. Modern appliances such as refrigerators,
[251] deep freezers and electric toasters are common in
[207] Shawbost. Most homes also have television sets, and
[206] many have telephones.

288 The mill in Shawbost employs between 60 and 70
463 persons to dye, card and spin yarn, to prepare the yarn in warps which are then delivered to weavers who work in their own homes, and to darn, wash and market the

592
241 like to leave the loom for the time it took to look
31 after the sheep."
288

592 A fourth household consists of three unmarried
231 siblings in their 40's and 50's who recently sold their
24 cattle and now keep only sheep for their own consumption.
[233] They cultivate a small amount of oats and hay to feed
[246] the sheep during the winter. The brother who was largely
[288] responsible for taking care of the livestock is now
[463] "concentrating on the loom," and his brother works in the mill. Their sister, who used to work in hotels on
[409] the mainland, now keeps house for them. Described as a
• [404] "self-contained family," they have a tractor and a deep-freeze and take care of their peat and the harvesting
654 of crops by themselves. One of their crofts has become
423 too waterlogged even for grazing and was sold recently to the son of a local crofter, not for agriculture but as a prerequisite for applying to the Department of Agriculture for a housing grant. Only tenants of crofts can apply for such grants. As this particular croft is too wet to be cultivated or used as a house site, the only motive which the new tenant has to become a crofter is to gain access to governmental subsidy.

592 The fifth household is composed of a retired couple
233 and their son and his wife and family. They have no
311 cattle, and use the crofts for grazing sheep.

175 During a huge snow-fall that occurred on
261 Lewis in the 1950's, the mobile grocery vans and other
[132] supply vehicles could not come out to the west side,
[443] and a group of men had to make an expedition into town for provisions, after which many families made certain that they always had a good supply of meal, salted
• [404] mackerel and herring. Many villagers have gotten deep
[365] freezers to store beef and mutton; others say they do not trust the freezers, that a failure in electricity--which occasionally happens in this region of gales and far-away repairmen--would bring disaster if they depende fully on them for keeping their meat. When the tweed
458 industry is going through one of its periodic depression
226 more men go out more often to fish. "I've been going out every night for the last week or so. I don't have a tweed, and I won't have one for the next six weeks. I don't know what I'm going to do; maybe I'll go back t sea. Three of us caught one hundred mackerel last
[251] night. I salted my share, and didn't give any of them away. These are the hard times. We're going to need them during the next six weeks."

233 A few people raise beef cattle, depending largely
[654] on subsidies for encouragement to do so. A few are
[234] beginning to keep cows again for milk, giving as their
[435] reasons that freight charges make the bottled milk too
[434]

Lewis and Harris

sent to several shipping ports, and the response was good; one Liverpool chandler even offered to take the whole output at a good price. But again the product was rendered useless, this time by being subjected to a partial-distillation process, in the thought that this would improve it; orders stopped. One shale-oil firm offered to take the crude peat tar to refine along with its own products for the purpose of modifying the flash-point of the oil it was itself manufacturing. Most commercial enterprises would have jumped at the chance of disposing of their output without the need for the always-tricky refining process, but here personal interests intervened and another avenue of profit was blocked.

The Lewis Chemical Works had by this time become something of a showpiece, chemists and scientists mecca-ing their way to Stornoway to see both plant and product. One eminent chemist pronounced the plant one of the most successful ever erected for the distillation of hydrocarbon oils from peat, and an Irishman said that if the Irish Peat Company's installation had been as successful as the Lewis counterpart, Ireland would have been enriched by her peat bogs. By the middle of the 1860s a ton of peat tar was being produced for 70s, as against 100s for unrefined shale oil. Peat oil sold at first at 2s 9d per gallon, then dropped to 2s 6d and finally to 2s, presumably as the American oil products were reaching the market. The writing was on the wall. Sir James Matheson, realising too late that perhaps a closer control should have been applied to the venture from the beginning, decided to cut his losses and close the works. All the metal—condensers, pumps, stills, pipes, and tanks—was broken up and sold for scrap. Nearly four miles of light railway had been laid from the Creed Works to the peat bogs; this was lifted for scrap. So ended the first phase of industrial Lewis. The venture proved, however, that with adequate skill and knowledge success could be grasped.

Bricks, printing, whisky

The brickworks which Matheson built for £6,000 at Garrabost produced building materials and some fine examples of draining tiles, but has now disappeared. The Patent Slip built at Stornoway for another £6,000 was able to take ships of up to

[TEXT CONTINUED ON PAGE 127]

800 tons and had a steam-driven winch. The slip has also vanished—except for the name of the Patent Slip Wool Mills, which produce Harris Tweed. 396 • 175 *

Other small industrial activities in the island during the nineteenth century included the business of Alexander MacPherson, chemist, druggist, stationer and printer, who set up in Stornoway in 1842. He brought across the Minch with him Lewis's first demy-size hand printing press, which was still in use on 1 January 1889 to produce the first issue of the short-lived *The Lewisman*. Copies of this earliest Lewis newspaper can be seen at Stornoway Public Library. Early in the 1890s Thomas Nicolson also set up as a printer. 175 * 204

Whisky was once an important product, not only for local consumption, but also for export. One of the Privy Council's main indictments against the islanders in the Hebrides in 1622 was that they seized any cargo of wine and spent 'bothe dayis and nightis in thair excesse of drinking'. The council therefore enacted that masters of vessels sailing Hebridean waters should carry no more wines. It has been suggested that this and other measures were responsible for the beginning of illicit distilling, which in Lewis continued overtly as late as 1827. One of the two principal stills established by Lord Seaforth in the island at that time was at Coll, a few miles from Stornoway, the other at Gress, a few miles farther on. Such was the fame of these stills, both for output and quality, that it was hard to choose between 'Coll' or 'Gress'. Sometimes, the product passed as an article of exchange in the island, and the factor received a considerable part of the rents in it instead of money; but the stills were closed about 1870. The *Inverness Courier* of 14 November 1827 remarks virtuously: 'Owing to the vigilance of Captain Oliver, of the Revenue cutter "Prince of Wales", and the new Excise Officers on shore, smuggling is so completely put down in the Long Island that there is actually not a drop of illicit whisky to be got from the Butt of Lewis to Barra Head; and there is probably at this moment a larger supply of legal whisky from Greenock for the supply of Stornoway alone, than was ever imported into the Hebrides before.' 273 274 175 * [439] [436] [427] [439]

THE OTHER ISLANDS

even to the extent that the St Kildans used their observations of the flights of birds both as compass and as omen for good or evil. Martin speaks of the islands with amusement and admiration. He indicates that the community was backward in some ways: they were illiterate, and wondered naïvely at the newcomers and their manners. 'The inhabitants of St Kilda are much happier than the generality of mankind, as being the almost only people in the world who feel the sweetness of true liberty.'

In May 1877, when the local tourist trade had hardly started, HMS *Flirt* sailed from Greenock with food to relieve hardship among the St Kildans, and an officer of the Highland & Island Agricultural Society on board reported that 'Tobacco was what they invariably asked for'. The ordinary diet of the island consisted of, for breakfast, porridge and milk; for dinner, potatoes and the flesh of fulmar, or mutton and, occasionally, fish; for supper, porridge when meal was plentiful. Seabirds' eggs, from March onwards, also formed a staple food. Tea was taken once or twice a week and the islanders were reported to be 'rather fond of it'. There were eighteen inhabited houses, sixteen of which had zinc roofs, two being thatched huts. The sixteen new cottages had been erected about 1863, 'and are certainly much superior to the inhabitations of the same class of tenants anywhere in the Western Isles'. All were well furnished, peat was used for fuel and there were two watches and one clock on the island. There were some seventy-five islanders; most of the men were old, and only two of them were unmarried, with twelve spinsters still to choose from. All read the Gaelic Bible. The men were mostly tailors, shoemakers and weavers; every house had a loom. They made all their own clothing, the men also making the women's dresses, and a good deal of blanketing and tweed cloth was made and sold. Nearly every house had a spinning wheel and a large pot in which the yarn was dyed. The women were expert knitters. Each croft and house was rented at £2 annually, sheep being charged for at the rate of 9d per head; these charges were usually paid in kind.

Feathers of the sea fowl formed the principal export of the island. The factor paid 6s per stone of 24 lb for black feathers; and 5s per stone for grey. For these he received, in Edinburgh or

171 typical homestead or "farmtoun" consisted of a
175 "ploughgate" occupied by eight tenants, each of whom
427 contributed one animal to the common plough and thus
241 had an eighth of a share of land or one "oxgate"
(Grant 1930: 97).

175 In the Highlands and particularly in Lewis, abou
427 four to six men and their families worked together an
241 shared land which was held in run-rig. The Old
[476] Statistical Account (1796) lists 90 ploughs in the
[407] parish of Barvas or about one plough per five familie
(Geddes 1948: 57). Geddes maintains that joint tenan
175 paid an equal share of the rent and had equal "soumin
427 (the number of stock allowed on the common grazing la
24 In contrast, Walker (1812: 56) says that joint tenant
114 paid different rents according to the share which the
233 had in the arable land, and that the number of cattle
which a tenant had on the common grazing land was sou
or proportioned to his rent; all the tenants worked
arable land together, and received a percentage of th
produce which was appropriate to their share. Geddes
description (1948) emphasizes equality within the joi
farm; Walker (1812) and Gray (1952) point to differe
between tenants and subtenants.

312 There is no piped water supply and after even a short period of dry weather there is a
[60] water shortage. One prosperous crofter (where the crofter does weaving and one member
of the family is periodically away with a Norwegian whaling fleet) bought a large modern
Bendix electric washer only to find that there was not sufficient water to use it except on
[35] rare occasions. The croft houses have had electricity since 1954, and even the three
remaining inhabited thatched houses now have electricity.

311 Although there are only 4 full-time crofters, most of the crofts are carefully and well
worked. Only a few crofts are decaying, and there is a tendency for these to be sub-let
to the more agriculturally inclined crofters instead of allowing the land to revert. In
[28] addition to the full-time crofters, 31 other men do part-time crofting. Eighteen men
weave and this provides their main income, but this figure fluctuates according to the
prosperity of the Harris Tweed industry; at present the figure is probably higher than
[166] average. Although 32 people have emigrated from the township since 1939 (many of them
young people who have married on the mainland), there are still several young people and
[161] young families making their homes here. The dominant age-group of permanently resi-
[162] dent adults is 15 to 44. Total population is steadily declining, but Callanish has always
been a prosperous area and seems likely to remain among the more prosperous crofting
communities.

BREASCLETE PARK by Margaret Grice and Doreen J. Phillips.

175 Breasclete Park, also known as New Park, Callanish, was settled by people cleared
from Reef in the mid 19th century. Two of the six original crofts have been subdivided,
427 making nine. However, there are only five working units and on one there is no culti-
vation. There is also a feu house built in 1958.

361 The crofts, which are fenced, form broad strips perpendicular to the Breasclete-
241 Callanish road. Cultivation is mainly by tractor, oats, potatoes and some clover being
grown. One progressive crofter has successfully experimented with re-seeding one
231 acre of grazing land on his own croft. Common pasture for the 148 sheep and 6 cattle
is shared with Callanish, and for most purposes the Park can be considered a part of
that township.

162 The total population is 26 of which 4 are permanently away. There are 6 people over
65, and 8 children under 15.

BREASCLETE by Margaret Grice and Doreen J. Phillips.

131 Breasclete is situated on the east side of East Loch Roag on land which rises gently
from the seashore to the moorland and is interrupted by rocky outcrops of gneiss in the
133 northern part. It is separated from the township of Callanish to the south, by a small
westerly flowing stream, at the mouth of which is the site of a mill.

491 The road on which most of the houses are situated, follows a curve through the
361 middle of the crofts, but newer houses and some feus have been built along the main
Callanish-Cartoway road, nearer to the shore. Stornoway is 18 miles away along this
road which is turned throughout. Breasclete could be served by the still unfinished
Pentland Road, were it to be properly surfaced and this would make the journey shorter
[491] by 4 miles. Two buses in each direction per day connect the township to Stornoway, but
high fares make visits to the town infrequent.

312 The township hopes to receive the mains water supply within the next few years, but,
at the moment, relies on wells within easy access of most of the houses. Many houses
have piped water from private wells, some of which go dry after two or three days good
weather although the wells on the lower ground never fail.

405

405 WEIGHING, MEASURING, AND RECORDING MACHINES--scales; meters; thermostats; clocks and watches; calculating machines; computers; cash registers; phonographs; sound recorders; typewriters; etc. See also:

*159 himself. If he had a drink he might come out. When the weaving started, he took that up; and he tilled the croft, kept cattle and all that; but socially he was a misfit. It was a terrible tragedy, the Iolaire."

[402] When the Bodach Beag returned from the United States, he bought a Hattersley loom to replace the old wooden loom with which his brother had been weaving. They worked the croft together. The Bodach Beag knew he would get the croft. He married soon after he returned, and for the next forty years never left the island. His wife took a six-month course in poultry-keeping and milking, and they concentrated on cattle rather than sheep. His wife sold fresh butter to the mobile vans.

*159 594 [167] Their family grew and dispersed. The eldest son attended the secondary school in Stornoway, emigrated to Rhodesia and married an English girl who was working there as a nurse. They had to return when economic earthquakes shook Rhodesia and he lost his job. He stayed at home for a year and built a new house on the croft; and then, unexpectedly, he started work to complete the necessary exams to enter a university and become a teacher.

[166] The youngest son became an engineer, married a Glasgow Highlander whose parents came from Lewis, and settled in Glasgow. Their sister married a tradesman on the mainland. The third son, unmarried but engaged to a local girl, works in the local tweed mill and lives at home with his parents.

"The cattle give too much trouble." A smaller scheme is grazed only by sheep. On the schemes where mixed grazing is practiced, a number of conflicts arise between those who have only sheep, and those who have cattle as well. To accommodate different demands, one township scheme was divided with a fence; cattle were put in for a month in one part, and then shifted to the second part. The sheep were then brought into the first half. All stock had to be removed from the scheme a month before the lambs were weaned, so that all worm eggs and other harmful elements in the dung of animals previously present would have time to die. What was once used for a single purpose by everyone now has to be divided.

"I paid one pound a head to put cattle on the reseeding," says a man named Iain. "Now I have to move them off already. Those sheep people want it for themselves. I won't use it if they're going to be like that. Next year I'll have the use of two crofts and my apportionment. And now that I have my own tractor I can put a load of sand at the bottom of the croft to make the grazing better."

According to another person, who also keeps cattle on the reseeding, "Some people want to move their livestock on and off the schemes when it suits them, like Iain,

592 241 311 288 like to leave the loom for the time it took to look after the sheep."

592 231 241 [233] [246] [288] [463] A fourth household consists of three unmarried siblings in their 40's and 50's who recently sold their cattle and now keep only sheep for their own consumption. They cultivate a small amount of oats and hay to feed the sheep during the winter. The brother who was largely responsible for taking care of the livestock is now "concentrating on the loom," and his brother works in the mill. Their sister, who used to work in hotels on the mainland, now keeps house for them. Described as a [409] [404] "self-contained family," they have a tractor and a deep-freeze and take care of their peat and the harvesting of crops by themselves. One of their crofts has become 654 423 too waterlogged even for grazing and was sold recently to the son of a local crofter, not for agriculture but as a prerequisite for applying to the Department of Agriculture for a housing grant. Only tenants of crofts can apply for such grants. As this particular croft is too wet to be cultivated or used as a house site, the only motive which the new tenant has to become a crofter is to gain access to governmental subsidy.

592 233 311 The fifth household is composed of a retired couple and their son and his wife and family. They have no cattle, and use the crofts for grazing sheep.

THE SEASONS

241 thirds of an area nominally under crops actually grows them. It need hardly be said that such crops do not support a family.

The means of cultivation have been either pony-drawn plough in the smoother north, or else the foot-plough (*cas chrom*), and the straight spade in the hilly south. I saw the almost obsolete foot-plough used on hilly ground near Rodel, Harris, in 1919. In the smoother lands from Stornoway and Barvas northward, heavy ploughs with three wheels were already laid out in parallel strips, no more than twelve to fifteen feet wide, divided by open drains. Open drains have increasingly been converted into underground drains over which pony and plough can pass. The cattle feed on the rough pasture or on the grass about the crofts, supplemented by hay cut with a sickle from the grassy edges of the 'lazy-beds'. Quite recently, rotation grass has been sown on the arable strips, and mown for hay by the scythe. Tractors were introduced in war-time, in 1942.

In many of the villages, cattle are still taken to the summer pastures out on the moors some miles from the crofts. Those who herd the cattle live in huts or shielings, annually re-roofed. In the congested 'Point district' (the Eye Peninsula), the cattle must go to the moor on the main island or be taken on to their owners' crofts from late May or early June to about the 10th of August, in order to clear the common grazing and allow the grass to recover. This migration takes place, of course, because of the restricted area of common pasture. On the other hand, pasture is plentiful in the parish of Lochs, lying all round some of the villages, and here the use of the shieling has been practically abandoned. In almost all villages, with the exception of those of the Eye Peninsula, there is less summer pasturing than formerly; fewer cattle are sent

COMMUNITY FROM PAST TO PRESENT PT. II

362 of new steadings. The average amount of loans (totalling 652 £166,000) was under £150; repayment has been satisfactory, and the arrangements made by the Department of Agriculture won general praise among the people. Yet 1200 houses were very far from replacing all the 'black houses', and more are needed.

In terms of cash profit, ten crofters today run their 433 crofts less remuneratively than the farmer they dispos- 427 essed; even together they may show little more total 241 production than the farmer. Nevertheless, these ten crofts each allow a part, at least, of the basis for a country home. (423) Hence the weight of public opinion supported, nay, insisted on 'giving back' the land to the descendants of those who 654 had worked it sixty or a hundred years before. The State 423 bought the farm stock at a high valuation, and lifts lately without adequate reform of crofting use and wont. The farms having now been divided, a great emotional issue, which had smouldered for half a century, has been brought to an end. Although the practical results are small, the crofters feel that justice has been done, and that fact may 311 be a great gain. Now that there is no more great reclaimed land to be had, the reclamation of the peat moor, or the grey 'mossy' land (Gaelic *fiaslach*) at Barvas and Ness, is important.

By financing the renewal of Leverhulme's brief attempt to reclaim deep peat on Arnish Moor, south of Stornoway, the Canadian, T. B. Macaulay, made a resolute attempt to solve the island's main agricultural problem. Good crops (241) were grown, potatoes and silage produced, and a dairy farm established. But the difficulties called for continuity of effort and research. From the practical point of view of 'demonstration' it had been a mistake to tackle deep and almost level peat, black in colour and viscous in consistency. (407) There was not the light machinery required for cultivation.

133 Over most of the parish the natural landcape is a series of low plateaus, generally below 250' O.D. around East Loch Roag, but rising westwards to an extensive platform with many summits around 500'-700'. Into this platform, towards its western edge, is incised the narrow trough containing Little Loch Roag. Above it rise the deeply dissected mountains of North Harris: at the best-preserved ridge, which runs east-west, slopes reaching to 1,500' or more and summits to 1,885'. The discontinuity between plateau and mountain is particularly well displayed along the shielings, which are situated roughly with the junction of granite and gneiss; an even more severe discontinuity, but formed entirely in gneiss; is to be seen near the south end of Loch Langavat. Lindhadi (1,611 O.D.) rises more than 1,400' in less than a mile. The mountains, although lacking height, are therefore striking in scenery. Glaciation has left them with rounded summits, but their surfaces have been roughened and scraped bare by ice action and numerous hollows preserve shallow lochans and a few larger lochs. Occasional rocky hillocks rise 20'-100' above the plateau; their abrupt discontinuity with the smooth surfaces is entirely comparable, though in miniature, with that of the mountains. The landscape resembles nothing more than tropical inselberge and have no apparent structural explanation.

Unconsolidated superficial material, such as would provide sub-soil drainage and suitable raw material for cultivation, is rare. The dominant feature of surface almost everywhere is bare rock, often blanketed by peat at lower levels and on gentle slopes. Morainic material is most common on the plateau, but is very patchy and discontinuous, and, more recently, heavy rainfall have swept clear most of the higher and steeper places. In the east and south-east, e.g. around Garrabost, the surface is covered with large boulders; 135 in sometimes seen; the coarse gravelly drifts of south Uig have already been mentioned. It is impossible to make any useful generalisations regarding the distribution and distribution of the boulder clays because their occurrence is so sporadic and exposures 5 beneath the peat are so limited. Very occasionally, as near Garrabost, there are well bedded soil blinds or greenish grey clay to ease which is said to have been used for coarse pottery. This may be a Bronze Age deposit, but it may be a post-glacial deposit or it might be a modern clay of the same period; there is however, no clear example of a raised beach in the area, which, were it present, might support the latter suggestion. 5 Since our visit a lacustrine deposit of diatomite has been exploited on a small scale in Bernera.

Extensive deposits of fine white sand occur around the bay and at the Valtos-Kneep-Reef area; smaller deposits occur at Mangersta and Mealisaig. Except at Cliff Bay, Valtos, where it contains a high mineral content, the sand consists largely of finely broken shell debris. This blown sandy sand is found inland for half a mile or more and as high as 100' O.D., providing a natural surface dressing rich in lime. There are extensive machair lands (sandy plains) at Kneep and Valtos and smaller areas at Cliff Bay, Mangersta, and Doris (Bernera). Little cultivation takes place on the machairs nowadays.

133 In the whole parish little soil, such as would be recognised by a lowland farmer, is to be found. The most usefull surface features have rich and blanket bog; arable land, hay 7 meadows and improved pastures are generally made on peat, gathered together into long 225 narrow beds - so-called "lazy beds", separated by deep ditches. This expedient may 225 mean that the use of tractors is impossible; since horses have almost disappeared, cultivation is much slower, if carried out at all, most now be by the spade alone. This is the traditional method of lazy-bed work: it may be very productive in terms of yield per 24 square yard but it is potentially unproductive in terms of man-hours. In some areas it 24 is clear that it has led to soil erosion. Even where the size and lay-out of the beds permits tractor work the cost of labour appears to be prohibitively expensive in turning, as it does plough. In a few places, e.g. some of the East Loch Roag

(TEXT CONTINUED ON PAGE 9)

townships and at Islivig and Breanish, the peat is thin (or has been stripped) to reveal a gravelly drift. Tree-draining on suitable slopes. In such places a black loamy soil has been developed by cultivation; the many fields of the thirlet of Isafjord cultivation are not necessary 24 now, if the area is large enough, it can be worked by tractor. Such soils, in the climate of the west coast, are fairly suitable for grass and crops, but, unfortunately, they are more could be done with them under knowledgeable management. Where shell sand has been blown inland on to peaty soils the natural bog-dressing has had a remarkable ameliorating effect on texture and acidity. Such areas are all too limited, the most important are at Valtos, Kneep and Reef, and around Uig bay; smaller areas are at Mealisaiv, Mangersta and Doris (Bernera). The hill grazings are dominated by a thin heather cover on peat or peaty soil, with occasional rocky hillocks rising above. Since the cattle population has been declining many older residents claim that the pasture, particularly near the crofts, has deteriorated; they have deteriorated because overgrazed and coarse heather increasing. "The hills that were green when I was a boy", said one, "are now black". Neglected and overgrazed pasture is certainly, in part, a result of the fact that it provides the difference between the old lazy beds and, if the ground is at all waterlogged, even towards the beds as well. Drier ground, if not well drained, will be invaded by heather. The limited machairs are little better; almost devoid of humus, they show little development of soil profile, only a thin grey sand with a few weeds or injudicious cultivation readily cut off wind-erosion. Only where the wind has provided a natural blend of peat and machair are cultivations better. Such areas are very limited.

132 The climate is in many respects severe; no local statistics are available, but some for Stornoway and Benbecula are appended. The frequency of high winds has a bad effect on both vegetation and stock, not to some extent and contracts excessive moisture. Near sea-level, where all the townships are situated, frost and snow are almost unknown. This it is supposed to the wind that the Gulf Stream ameliorates the winter temperature, but one suggests that if pasturee could be improved to suitably sheltered places far more advantage might be taken of the relatively mild winter temperature. It is important that the sunshine record is particularly poor in the south, where clouds can frequently be seen hanging over the mountains when the sun is shining on Barvas and the area north east of East Loch Roag. The relatively dry and sunny period which commonly occurs in May and June could make for a good hay harvest, if conditions were favourable and farmers, such as they are, are late starters, and the custom is to cut the grass when it has gone to seed. Thus hay is often being taken in September - one of the wettest months in the year.

CHAPTER TWO

SOME HISTORICAL ASPECTS

172 Evidence of pre-historic and other early settlements in the parish is afforded by the occurrence of standing stones, chambered cairns, "Pictish" brochs and the sites of the latter are by far the most remarkable ancient monument in the Hebrides, and testify to the relative importance of the site even though today their practice significance may not be clear. Most of the dune are now little more than circular lumps of stones, but in that at Dun Carloway, which is the best preserved, a considerable amount of the original structure is recorded in the plans issued, a very large proportion of which contain Norse 174 elements such as "Dun", "Bragar", "Ness". It seems probable that some of the 176 present township sites have been more or less continuously occupied since Norse times.

1. [Presumably the author means "croft"—Ainslyet]

182 The circular, corbelled stone "beehive" huts, some still in good repair, are of uncertain date but are known to have been occupied in the 19th century. Their distribution is not well marked; it almost certain that they were only occupied seasonally; those on the Carrynahine common pasture are fairly well preserved, although overgrown, sufficiently strongly for the 183 footpath over the sands to the south. General merchandise, fish and meat are supplied by weekly vans; there are no shops. There is a post-office at Islivig: banking facilities are supplied by a mobile bank.

The majority of the crofts are long narrow strips, with those in Mangersta being somewhat more compact. The area ranges from two to nine acres, with an average of about four acres; in Breanish and Islivig only about half is cultivated. All the crofts - or croft-units - are occupied by tenants, but there is a small owner-occupied farm in 1958. There are twenty-nine crofts in the rental for Breanish, ten for Islivig and thirteen for Mangersta; 187 contact with the outside world is maintained by a small motor-launch and a considerably less - fourteen in Breanish, five in Islivig and ten in Mangersta. There are no cottars.

As crofts are reasonably good and comparatively free from rocky outcrops, the arable pasture is well developed; there are no sheep, but many cattle, horses or tractor. There is a tractor in Breanish, and four horses, a horse in Mangersta and two in Islivig. All of these are 178 used for cultivation purposes. Very little work is done with the spade, unlike many of the other Uig townships.

233 While the general rhythm of township work through the year is similar to other areas, 178 the sheep are kept on the hills, some are shorn and dipped in the hills, some on their crofts. Breanish crofters are allowed to winter eight sheep, (or sixteen hogs, or four year-old 233 ewes) fishing for herring and cutting peat for their own use and sale, by taking over the 178 clifts, in less extreme than the loss of heifers. Eilean Mealaidh is used by Mangersta 233 sine in Breanish, two in Islivig and one in Mangersta, and keep what they were kept here; in 1958, however, few orders were received. Wanting cannot be said to bring in a steady 178 income care, and some of the crofters have left the district, find additional employment outside 233 the township - this includes four men at the hydro-electric scheme at Gisla, three at 178 Barvas, seven at the Marconi station, three at Aird R.A.F. station and at least 233 one in the Glen Valtos quarries. In addition, one man owns a tractor which he hires 178 out, and one, owning a Civil and van, does haulage work. Altogether, out of a total of 233 twenty-seven men under sixty-five who do work, all but three (one just out of school and 178 one a semi-invalid) have other employment in addition to their crofts.

162 The population of the three townships in one hundred and twenty-one residents, 233 and fourteen permanently away from home. Of the residents, twenty-eight (or 23%) are 422 children of school age, forty-nine (or 40%) are in the 15 - 60 age group, 18 (15%) are in the 65 - 65 age group, and 31 (26%) are over 65. Of the resident females, thirteen are over 65, twelve under 65, and five between 45 and 65.

The relative young population is likely to survive, together with the better soils, for the area giving an impression of a fairly prosperous crofting district compared with some of the others in Uig. Amalgamation of crofts into larger units has also gone further. The use of a tractor or horse for ploughing, extensive use of artificial fertilizer, the sowing of grass seeds and the sale of sheep for meat, all seem evidence of a group of people who are determined to make the most of their limited resources.

233 One enterprise, that of the Aird Sheep sheep farm, deserves special mention. Four crofters (three from Breanish and one from Islivig) have purchased from the Uig shooting tenant 2,500 acres of land on the Aird Bhig and Aird Mhore peninsulas, five miles south of Mealisaiv. Here they are running a flock of about five hundred sheep. There is

Breanish, at the end of the tarred road which also serves Islivig, is forty miles from Stornoway. On the tritha weekly bus the return fare to Stornoway was £1, and freight charges are very heavy. These sailings were at the western end of Mealisaiv, only about 1 mile from the township. The Breanish "distant" shielings, about six miles to the south-east of the township across the mountain, were not used after about 1950, which, in the adjoining shielings were last used in 1932. Occasionally a cow may have had its original shielings to the east of Loch Mealaiv: about a mile south of the township, but after obtaining the enlargement from Breanish, between about 1930, shielings were used in that area.

No peats are cut on the crofts; the peat-cutting areas for all three townships are near the road and no use can for them the township. The common pasture near the crofts bears evidence of former cultivation, but it is at least fifty years ago since crops were grown on it. At this time the township of Islivig and Breanish were over-populated with many cottars who were given a small area of land in return for their labour on the farms. Today, less than half the 'old arable' is being cultivated, and in several cases the land is used solely for hay and grazing.

There are now no thatched houses inhabited in the townships and most houses have kitchen and other extensions added. Some crofters have built concrete two-storey byres 342 of modern design, and have installed water troughs and electric light; a general enlargement area and the Breanish river a good source of supply, all the crofts have their own private piped water supply, and in Islivig the water, in fact, is better than many other crofts, and is giving a 377 water supply. All croft houses are supplied with electricity from the grid.

226 Commercial fishing has long ceased and as there are only three boats there is now very 226 little fishing for herring and cutting peat for sale, and the fishing is left to fairy sheep to the 226 self-shore intends. Weaving is an important occupation. There are seventeen weavers - 226 nine in Breanish, two in Islivig and six in Mangersta, and keep up the tradition they were kept here; 226 in 1958, however, few orders were received. Weaving cannot be said to bring in a steady 226 income care, and some of the crofters have left the district, find additional employment outside 226 the township - this includes four men at the hydro-electric scheme at Gisla, three at 226 Barvas, seven at the Marconi station, three at Aird R.A.F. station and at least 226 one in the Glen Valtos quarries. In addition, one man owns a tractor which he hires 226 out, and one, owning a Civil and van, does haulage work. Altogether, out of a total of 226 twenty-seven men under sixty-five who do work, all but three (one just out of school and 226 one a semi-invalid) have other employment in addition to their crofts.

162 The population of the three townships in one hundred and twenty-one residents, 233 and fourteen permanently away from home. Of the residents, twenty-eight (or 23%) are 422 children of school age, forty-nine (or 40%) are in the 15 - 60 age group, 18 (15%) are in the 65 - 65 age group, and 31 (26%) are over 65. Of the resident females, thirteen are over 65, twelve under 65, and five between 45 and 65.

The relative young population is likely to survive, together with the better soils, for the area giving an impression of a fairly prosperous crofting district compared with some of the others in Uig. Amalgamation of crofts into larger units has also gone further. The use of a tractor or horse for ploughing, extensive use of artificial fertilizer, the sowing of grass seeds and the sale of sheep for meat, all seem evidence of a group of people who are determined to make the most of their limited resources.

233 One enterprise, that of the Aird Sheep sheep farm, deserves special mention. Four crofters (three from Breanish and one from Islivig) have purchased from the Uig shooting tenant 2,500 acres of land on the Aird Bhig and Aird Mhore peninsulas, five miles south of Mealisaiv. Here they are running a flock of about five hundred sheep. There is

* The old parish of Uig embraced the Loch Carloway district, from Hirtrich north; this area by it self, Breanish and Islivig, Mangersta, and Doris (Bernera) is specified figures quoted have been corrected to conform with the modern boundaries.

1. [See p. 8—Ainslyet]

36 Many of the original houses are ruined or used as byres. Figure 14 shows that new houses have been built near the sites of the old ones, sometimes nearer the shore - and not far from houses have easy access to the road. Crowlista is linked to the main road by two miles of rough gravel side-road, and by a bridge and ford via Timsgarry. Vans call but there is no Post Office, nor bus service. At present water supplies are poor - two wells only are in use.

Carnish is served by a short unmetalled road and all houses have good access to this. Water supply is good; water may be stored on the high part of the crofts and piped into the houses. The roads serving Timsgarry too, are unmetalled, but the main road is less than a mile away. This 'main road' from western Uig to Stornoway runs through Ardroil and on to Miavaig; one of the houses not near to it have good drives suitable for lorries. Ardroil has a store and Timsgarry a Post Office. One butcher's and two grocers' vans call weekly and the travelling shop twice fortnightly. The main bus service to Stornoway (Ardroil) leaves there almost 41) caused in 1960 because of competition from privately owned vans and cars.

24 The cultivated land is in strips usually large enough for horse or tractor work; the smaller potato patches are hand dug. Few horses are kept now, Timsgarry, Ardroil and Carnish have one each and Crowlista none. Crofters hire them hitters or tractors from Breanish or Enacleit. Oats and potatoes are the only crops grown in quantity, small patches of turnips are found and most crofters grow vegetables. Kale was seen growing on one Ardroil croft: this was an experiment and seemed to be very successful. Bere and rye are no longer grown. Grass manures are sown in order to qualify for cultivation of peat. Oats are undersown, or grass seed may be sown after the oat harvest, and left for hay for several years - some sown twelve years ago was still to be giving very good hay; but on the whole very little grass is sown in Crowlista. The acreage of natural grass cut for hay varies a good deal with the weather and the time and labour available. Crofters find this difficult to estimate well, as often small irregularly shaped pieces are cut, and the figures, therefore, may not be accurate. (Appendix A).

One excellent garden showed that a rich variety of vegetables, fruit and flowers can be grown if adequate shelter is provided and the time for cultivation is available, but few crofters have the necessary knowledge or labour available.

24 Lime, dung and artificial manure are widely used, though on some Crowlista crofts the compound fertilizers were in use for the first time in 1959. Shell sand is used on the crofts which have peaty soil. Although it is agreed that seaweed and dung are the ideal fertilizers for potatoes, seaweed is only occasionally used. It is becoming difficult to obtain locally and much heavy work is involved.

25 Each of the thirty-five operative units which carry any stock at all has a cow for domestic milk supply and manure. If the family is large or many visiting relatives stay in the croft during the summer the calf has to be sold early; otherwise it will be reared until the cattle sales in September or May. Only eight crofters had two cows; fifty-five had one; six had no cattle sales in September or May. Only eight crofters had two cows; fifty-five had one; six had no cattle at all. Only thirteen of the units had young cattle other than calves. One crofter was rearing a bid for milk.

The bull supplied for these townships and Mangersta is an Aberdeen Angus which is wintered on the Ardroil machair.

233 It was sometimes difficult to obtain factual information about sheep and it is difficult to generalize. Operative units without sheep were those where no suitable labour was available. In a few cases crofters considered that sheep were 'not worth the trouble' - but others were building up their sheep stocks. Individual flocks ranged from ten to two

133 The 1,700 acres of common pasture stretch to the east and west of the crofts, across the Carnish peninsula which terminates in the Stornoway lighthouse; extensive tracts of coarse grass in the south. The whole coast is broken and rocky, the land inland is peaty, and Ard Carnish has the advantages of the sea, and of the Carnish Loch. To the north of the village there is now an R. A. F. radar station on Rudha Cuaic, built on what was part of the common pasture. It dominates the landscape and makes a considerable difference to the life of the

34 The township, though isolated, is reached by a good road which leaves the main road
99 at the western end of Glen Valtos. Grocery vans call on Wednesday and Friday, a
100 butcher's van on Saturday, and the local people are also allowed to shop at the N. A. A. F. I.
101 Canteen at Valtos. The road then follows the shore, and crofts are strung out along the
102 R. contour at all the houses are built directly on to the road, with byres, weaving sheds
103 and other buildings behind them. The main bus stop is kept on the steeper side, by the road
104 the road. Thus the settlement has far more of the appearance of an English village than
105 any other croft township, but there is no shop nor post office. The crofts (8 and 2)
106 houses are stone with slate roofs and fairly large, though some of them have been built for
107 more than fifty years. All have electric light and their own water supply and several have modern byres.

407 There are ten crofts, as the enlargement of one of the original sites was subsequently
408 split off to make a separate croft. Of these, one tenant is an absentee and another an
409 elderly woman who does no cultivation. In both these cases, great up to let to others so
410 that there are actually eight operative units. The crofts are found in their ancient positions,
411 but in most cases the fencing does not extend down to the river and there is free access to
412 the single concrete footbridge which spans the river.

28 The only crops now grown are oats and potatoes and a few vegetables, with some sown
40 grass; natural grass provides most of the hay crop. Lime and shell sand and artificial
41 fertilizers are used; the two former particularly on the ground near the river where the
42 cultivation is in narrow strips separated by draining ditches and ploughing is done by horses.
40 Most of the cultivated land is on the gentler slopes behind the houses, where the use of a
41 tractor is possible. Between 1954 and 1959 the acreage of oats and potatoes was halved; bere was grown and ground at the mill for meal for barley bread. Seaweed was
42 used as a fertilizer and most crofters still use it for potatoes. In 1959 the acreage
223 there was a more plentiful supply of manure. Now, six of the families each keep one cow for domestic milk supply (two of the others each keep a goat). The township possesses
224 one bull, which has use of these at Valtos or Ardroil.

253 On the other hand, the sheep scum is generally exceeded; instead of the antilement of about 200, the total flocks grazed on the township pastures are approximately 500. The lambs are taken to Valtos for sale (Ardroil has no suitable place, and Valtos has not prevented this) and wedders are usually sold at the age of two or three years in Stornoway - many in October to reduce the numbers that must be pastured during the winter.

162 The total resident population of Aird consists of fifteen males and sixteen females.
Of these, twelve are over 65, six are aged 15 - 64, 11 are in the 5 - 14 age group (there are only three married couples) and there are two children under 15. Nevertheless, most of these are complete families; only one person lives alone; no members are reported as
164 periodically working away, no man and only two women are permanently away. Neither
164 has there been much emigration since 1939 - five women only have married out of the parish. The tenants of seven of the crofts are over the age of 65, the only one in the 15 - 44 age-group is a new-comer to the district and does little croft work.

432 strips running across the slope, which are interchanged each year, whilst a large part of
433 the common grazing lands are divided into interchangeable sections ("quarters") to
434 accommodate each of the groups of crofts. See Figures 22 and 23.

The cultivable croftland at Ksoep is relatively flat and the natural drainage is poorly
developed; the quality of this land, depends to a very great extent on the upkeep of a dyke
135 separating the croftland from a small stream which runs down to the sea. This dyke has not been
136 cleaned for several years, and as a result a large area has been invaded by reeds. Other
parts of the croftland have been similarly overrun by 'wild rhubarb'. Such deterioration is
almost inevitable when land is so fragmented.

The crofts at Reef are grouped in three separate localities. Crofts 1, 2 and 3, on the
edge of the machair have probably never been occupied since the crofts were allotted in
1911 and are now used as grazing land. Crofts 4 and 5 are kept on the steeper slope below
the road. Thus the settlement has far more of the appearance of an English village than
any other croft township, but there is no shop nor post office. The crofts (6 and 7)
houses are stone with slate roofs and fairly large, though some of them have been built for
more than fifty years. All have electric light and their own water supply and several have modern byres.

241 There are ten crofts, as the enlargement of one of the original sites was subsequently
240 split off to make a separate croft. Of these, one tenant is an absentee and another an
241 elderly woman who does no cultivation. In both these cases, great up to let to others so
that there are actually eight operative units. The crofts are found in their ancient positions,
but in most cases the fencing does not extend down to the river and there is free access to
the single concrete footbridge which spans the stream.

The crofting economy is probably at its lowest ebb in Reef. Only eight of the fifteen
433 crofts are occupied and of these five are worked by disabled crofters or crofters over
434 sixty-five. The Reef crofts were settled in 1921 by returning ex-servicemen and today
seven are being worked by the original settlers; there is little evidence of a desire among the younger generation to succeed to the crofts.

Until 1956, crofters on Reef used to graze both sheep and young cattle on the Flannan
Islands, 20 miles west of Uig.

Fig: 24 shows the age/sex structure of the population in the three townships. It tells
a story familiar to crofting townships: 55% of the resident population are over forty-five
years of age; 70% are over 45 years and only 15% are under 15 years of age. The population has declined by at least 19% as the result of emigration alone. But perhaps the most significant fact is the very small proportion of women of a child-bearing age and the consequence that only three children are being born each year to replace the older generations.

By their very position, the townships of the Valtos peninsula are isolated. Fifty years
ago communication with the rest of Lewis was by boat. The road to Valtos and Ksoep was built originally to bring the mails from the pier at Miavaig; the motor road to Reef was completed in 1956. Shopping facilities are provided at Valtos, for the people at Valtos and Ksoep, and of heavily which serves Reef, Uigean and Cliff. These are supplemented by travelling shops which call once per week, by Indian dealers and by the local 'one-man-band' who makes purchases in Stornoway on behalf of customers on the peninsula. The school for the whole area is situated mid-way between Cliff and Valtos and two kirks and the doctor's house lie at the junction of the Valtos and Reef roads.

241 Table 30 shows the present use of fertilizers and manure. It will be seen that
dung is still widely used but seaweed is used in a minority of cases, particularly
in Breakish and Earnebar. The report at least seems to be related to the varieties of
that have afflicted the township, and to the fact that several holdings are in effect
very small with but plots of cultivation. This also relates to the large number in
Breakish who use no form of fertilizer at all. Shell sand is neglected for reasons
of inaccessibility. It is present on Little Bernera, and more particularly and of
excellent quality, at Boots. It is difficult to get from within the island the large
quantities of sand needed to qualify for the lime subsidy; it would be possible to get
it from Boots sands, there is a township road to within about a hundred yards of the
shore, but the township committee has never seriously considered it to be worth while.

Artificial fertilizers are increasingly used. The first consideration at the present is
undoubtedly that certain amounts have to be applied in order to qualify for the plough
subsidy. Many crofters are not well-informed about the proportions and technical
applications of sulphate of ammonia. Lime, in the powdered form or as nitro-chalk, is
widely used and can be cultivated on a rotation basis with potatoes. The crofts (8 and 2)
use of artificial: they are often used only because of subsidy conditions, and the crofter
is served by good, though expensive, technical advice and technical fertilizers and research. This
experiment in which almost the whole township took part has proved very successful and
there is now a good deal of enthusiasm for the scheme. Lime is given free of charge.

Although the tractors of which there are two in the township are used wherever possible,
the spade is still used on many small patches, particularly for potatoes. Much hay is
cut by scythe and sickle and is stacked in the field. There is more in the
township but it is scarcely ever used for ploughing except by its owner.

The total number of sheep kept in the township is 1,500 i.e. 2½ times the crofting
stock. Ewes are kept and sheep are fattened for a large extent. There is very little rent. 40 crofters keep sheep and
are entitled to make a livelihood from sheep alone. Many lambs are lost on the
moors during the summer and more fail to survive the winter. The number of cattle
kept is 84, i.e. only 1/3 of that permitted. It is usual for each household to keep 1 cow
and 1 calf which is generally sold about 3 months when a subsidy can be claimed.
Breakish has no bull, but shares the one from Callanish. Most households keep
sufficient poultry for their needs but no eggs are marketed.

Shielings were still used to some extent up to 1930. Now it is not necessary as
fewer cows are kept than formerly. With the reduction in numbers of stock the common
pasture is now adequate for the remaining stock.

The crofters' year begins at the end of March when the ditches are cleaned and the
land is prepared. In April the ground is ploughed, fertilized and sown with oats and
potatoes are dipped and by the 10th of May most of the potatoes are in the moors as the
crofts are then closed to common grazings. Soon after this peats are cut on the moors
and two or three miles from the village. After about 20 days the peats are lifted into
the Peatland Road by tractor where they are stacked to await the lorry which takes
them to the village.

In June, the sheep are gathered into the farm for shearing and the cows are usually
brought to graze on the crofts from the nearby moors. If the croft is not fenced they
must be tethered. At the end of June the cattle are cut, while the potatoes must be
cleaned and hoed. In August the lambs are weaned and dipped. Natural grass is cut
for hay and if there is any grass grass this may yield a second crop. In
September, together with the corn harvest. When the potatoes have been lifted in
October the crofts are opened and the sheep are brought in for the winter. Final dipping takes place in November.

162 Out of a total resident population of 226, 56 are under 15 years and 57 are over 65
years of age. Of the resident tenants 9 are between 15 and 44 years, 19 are between
44 and 65 years and 26 are over 65 years of age. Twenty on persons are periodically
away e.g. students and seasonal workers and 30 are permanently away. Since 1939,

weather although the wells on the lower ground never fail. Mains electricity was installed
5 years ago, but on the whole cooking is still done by Calor Gas and peat. The chief
source of fuel for heating purposes is peat, although a little coal may be used.

There are 63 registered crofts, including many subdivisions, a small-holding of 15
acres formerly the Hill, and 10 feus, all of which are worked as 54 units. The crofts
are in long narrow strips in N. NW - SW direction from the moorland to the sea. All are
at least partly fenced, the fencing being of recent date. Some crofters are, at the
moment, making use of fencing grants to enclose their land completely.

The only crops grown are oats and potatoes, and although a little clover mixture is
sown for hay, many crofters find that the natural grass is sufficient for their needs.
Vegetables are produced in a few cases but most crofters do not use them in home or
interest to barter with them. Flowers rarely flourish owing to the lack of shelter.

Far less of the croft is cultivated now than in the past, and the land nearest the shore,
which was once cultivated on a rotation basis, is now used as a common pasture and partly
for grazing together with some peat cutting. A piece of the common grazing has been
surveyed by a local firm of surveyors, and is now divided into numerical fractions and renumbered. This
experiment in which almost the whole township took part has proved very successful and
there is now a good deal of enthusiasm for the scheme. Lime is given free of charge.

Although the tractors of which there are two in the township are used wherever possible,
the spade is still used on many small patches, particularly for potatoes. Much hay is
cut by scythe and sickle and is stacked in the field. There is more in the
township but it is scarcely ever used for ploughing except by its owner.

233 The total number of sheep kept in the township is 1,500 i.e. 2½ times the crofting
stock. Ewes are kept and sheep are fattened for a large extent. There is very little rent. 40 crofters keep sheep and
are entitled to make a livelihood from sheep alone. Many lambs are lost on the
moors during the summer and more fail to survive the winter. The number of cattle

[TEXT CONTINUED ON PAGE 95]

since 1939,
164 5 people have emigrated whereas only 4 have immigrated. Most of the girls have to
162 leave home when they finish school as there is no employment locally. Many of them go
to domestic service or nursing in Glasgow. Many of the younger men also spend time
away from home, often in the Merchant Navy. Breakish is also the temporary home
of the families of lighthouse men on the Flannan Isles.

288 Although the people live and work on the croft, weaving the Harris Tweed provides
the main source of income. This is a rather irregular occupation owing to the uncertain
demand for the tweed, and although the men are personally self-employed they rely on the
mills to supply them with work. The tweed is woven on treadle looms, which, with auxiliary equipment such as looms and warps, are all owned by the crofters.

241 As 1959 was a good year for the tweed industry, there was an air of prosperity in the
158 township, and with the aid of government housing grants many new bungalows were being
built. The school-master said that many of the young people would be unable to support the population and most of the bread-winners will have to leave.

TOLSTA CHAOLAIS by Roger H. Thomas.

131 The township of Tolsta Chaolais lies in a shallow glaciated depression occupied by Loch
137 N° Bhaile and Loch Shader. Most of the crofts are situated near the shore of these lochs
65 for wastewards to the sea the terrain is hilly and rugged for the majority of its extent or
361 covered with peat bog. The main road runs through the village of Tolsta Chaolais and
to the loch shore. As Figure 36 shows settlement takes advantage of the more gentle slopes and flatter areas.

Cultivation is very noticeably limited to three areas - along the west shore of Loch
137 N° Bhaile, along the north-east shore of Loch Shader; and in the valley of the small stream
241 joining these two lochs. Most of the crofts are in the valley of the croft land is centre-
pieced of rock outcrops, rarely exceeding 100 ft. in height, separated by deep depressions
filled in peat and reeds and rushes; these depressions are extensively cultivated in
particular, the area between the two lochs is badly in need of draining and is largely
covered by reeds and very coarse grass. It is not worthwhile to put in a proper job
enterprising person suggested that the township should hire a ditching machine - this
would certainly be put to use with great advantage.

632 The settlement comprises 43 registered crofts, 6 feus, 2 squatters, 1 cottar, and
1 holiday bungalows, with the croft holdings aligned north-east/south-west between the
two lochs and the sea, and one for one. Of the 53 holdings are unofficially
427 amalgamated in various ways and so reduced to 35 operative agricultural units. The
crofts are of various sizes from 2.5 acres to 15 acres, the average being 5 acres. Most
of the crofts - except for 1A, B, and C; and 12A, B, and C which are held 'run-rig' -
was carried out between 1911 and 1921 when the present arrangement of 1,700 acres
was fenced into two parks - an inner and an outer one, the division coinciding with the
Carloway to Breaclete road. The outer park is about 1,000 acres and is 21 feet, however,
been most haphazardly divided. The seaward halves of some five crofts were redivided
amongst seventeen crofts in the southern half of the township to compensate them for
lack of grazing area within their own croft boundaries. This division is said to date from about 1886.

241 Most of the cultivation is carried out with hired tractor, although two crofts owned
small mechanical cultivators. Ploughing by tractor and horse, as opposed to spade
cultivation, depends either on the ingenuity of the operator, or on the accessibility of the
plot, for any small patches of cultivation on the rougher terrain are dug by spade, as

Chapter 5

GEOGRAPHICAL AND SOCIAL MARGINALITY

182 Despite the growth of the Harris Tweed industry and the gradual disappearance of some of the techniques and expectations associated with heavy reliance on the land and the sea, an important factor which helps to sustain some of these patterns is the social and geographical marginality of the islanders.

175 When the young men who survived the second world [729] war returned to the island, most households still had [231] horses to cultivate the croft, but a few years later [407] the tractors replaced the horses. The Labor government, 175 which came into power after the war, passed legislation 657 which extended the processes of centralization that had proceeded since the breakdown of the clan system. The National Health Service was established. Free milk [871] became available in schools. More scholarships (called "bursaries") became available for further schooling. [207] Television came in the 1960's. In short, the islander was exposed to a number of new alternatives.

182 To the extent that persons became involved in these possibilities, the island became peripheral or marginal. The island has become more dependent upon central

*159 434 Net cash income or profit from the croft thus represents 9% to 10% of his gross earnings from weaving. If computed as cash, uncalculated income from the croft in the forms of garden vegetables and milk products would raise the croft income by L30 to L40. In those households that consume their own sheep, the croft contributes an even greater amount.

conditions backward. He tells us that the Island of Lewis had been fruitful in corn until late years of scarcity and bad seasons. The crops were barley, oats, rye, flax and hemp. The natives showed great industry in digging the ground with spades—a practice which he invariably associates with a large return. He even records that the abundance of corn had once been such that it encouraged them to 'brew several sorts of liquor'. For manure, sea-ware and soot were used. And harrows had two rows of teeth and rough heather in the third row. Pennant's visit to the island in 1772 found that the produce of the land was insufficient to support the population. Distress was rife.

In Martin's time, although the economy was more or less self-sufficient, a certain amount of produce was available for export or for translation into 'several sorts of liquors, as common usquebaugh, another called trestarig id est, three times distilled, which is strong and hot.' One assumes that this produce was surplus to the requirements of the island's population. The livestock consisted of 'cattle, horses, sheep, goats, and hogs'.

TACKSMEN AND TENANTS

Most of those who held land had leases: tacksmen, who paid rent for large tracts of land and who, by settling suitable tenants there, received rents, in money or in labour, as an additional income from their farms. These smaller tenants had no leases: they could not write and were subject to the tacksman's favour. In the early eighteenth century, the rental rolls for Lewis, preserved among the Seaforth Papers in the Register House in Edinburgh, show that most of the tacksmen—sixty-four in number—were MacKenzies, indicating that they were adherents of the Seaforth (MacKenzie) family on the mainland, who had received the lands from royal hands as the reward for their fidelity. The smaller tenants, who generally lacked surnames but were known by their personal characteristics, numbered over 200; there were also above eighty tenants in Stornoway.

Rents were paid either in money or, more often, in meal, mutton, sheep, butter, tallow or salmon. When it was proposed to sell the Seaforth estate of Lewis in 1772, particulars of the Lewis

but their negligence even in ye article appears from their sending out annual above 2000 of wool out of the country unmanufacture.'

Harris was rented at £600. Exports were some 100 tons of kelp (£325), and the value of 250 black cattle exported alive, with 100 salted, was £445. Small quantities of cheese, wool, and the skins of sheep, otters and seals were exported. Grain was neither imported nor exported.

The plough, which is used here, and in most places of the long island, is of a very peculiar construction. Its length is but 4 feet 7 inches, and is drawn by four horses abreast. It has but one handle by which it is directed; the mold board is fastened with two leather thongs, and the soke and coulter are bound together at the point by a rim of iron. Beside kelp, there is little else manufactured, except a little coarse woolen yarn, and some blanketing, which they send yearly to Glasgow. They raise a little flax of which they make some coarse linen for their own use, but import all the fine linen which they consume. In the year 1756, an American vessel in distress was obliged to put out three hogsheads of lintseed in Harris, which was sown and afforded crops of lint which were above double the value of the usual crops. The east and west of Loch Tarbert in the Harris are every year revisited by the herring shoals. During the five years from 1743 to 1747, the west loch was the principal seat of the herring fishery. About thirty vessels from 18 to 40 tons, belonging to Campbelltown, Greenock, and Irvine, were completely loaded each of these years at this place.

With even a modest amount of business taking place, it was a natural step to establish commercial facilities. Stornoway men who once acted as agents became shopkeepers. The increase in the use of money attracted banks. During the Seaforth ownership of Lewis, the island had its own currency or notes, designed and printed from plates in the same style as the modern banknote. The wording ran: 'I promise to pay on demand to the Chamberlain of the Lewis or Bearer ONE POUND Sterling at the Counting Room here.' The notes carried a date and were signed by the proprietor, J. A. Stewart MacKenzie. It is not known for certain how long the notes remained in currency, when they ceased to be used, or even whether they were officially acceptable. At one time, as rare items, they fetched high prices from collectors. A number were

368 ground. Some of these provide for a much larger area and indeed the policeman serves the whole of the parish of Uig. Three buses per day in each direction operating on a circular route provide transport to Stornoway.

UPPER CARLOWAY

427 The township comproses 51 registered crofts and 28 feus and allotments which are
133 situated on the drift covered slope which rises from the head of Loch Carloway. The crofts are each about half a mile in length and from 5 to 25 yards in width aligned up an downslope. The lowest portion of the croftland is just above sea level and the highest approaches 225 feet O.D. The key crofts are numbers 30 and 31 whose boundaries co to a point thus enabling the crofts to be accommodated on the arcuate hill face. In the east are the crofts of Park Carloway which were lotted at a later date than the main ar of croftland (numbers 1 to 40).

Only two crofts are fragmented ('fixed runrig'), these occupy lowlying hummocky near the river where fencing would be difficult. Elsewhere fencing has been almost completed between the roads, but above the upper road fencing is less common, usual only being undertaken by the more enterprising crofters with more promising land; t bare rock surface of crofts 9 and 10 precludes any such attempt there. Almost all th fencing has taken place since 1946.

427 The 51 crofts and 28 feus and allotments are operated in 56 workihg agricultural
311 The total land reputed arable 134.4 acres and the outrun 82.65 acres which gives a to fo 217.05 acres of individually held ('croft') land. The method of working is control by the relationship of slope, soil and elevation. Three zones may be distinguished, namely

(1) Below the road;
   a) well drained and fairly accessible,
   b) poorly drained and often far from the croft house
(2) Between the roads: a main zone of cultivation
(3) Above the main road an upper zone
   a) with bare rock and thin soil
   b) drift covered - similar in character to (2), but more exposed

Crofts 1 - 32 occupy all three zones
" 33 - 40 and 46 occupy zones (2) and (3)
" 49 is in zone (2)
" 41 and 42 are in zone (1)a and are in 'fixed runrig'.

241 In nearly all parts of these zones it is possible to use a tractor and so the cult
[40] of oats and cutting of hay is accomplished. It is usual to work the potatoes by ho but only one man preferred to do all his ploughing by horse. This widespread us tractor is in marked contrast to the townships southeast of the Loch where it is al impossible to use the tractor in many places. The significance of this in the con methods and efficiency need hardly be emphasised.

461 Life in a crofting township is governed by a very distinctive pattern of workin is so strong that it even influences the operations of the mills in Stornoway, for crofter, if he continues to work his croft fully, must take time off for the commu operations such as the shearing or dipping of the sheep and inevitably at certain the year he will be anxious to work the croft. The table attempts to set out the of the agricultural year in this group of townships (Figure 40).

[Seaforthhead]

Table XVII reinforces the idea that there is a striking dichotomy between the agricultural and fishing townships. The former are characterised by a more stable population trend, significantly fewer of the population in permanent employment furth of Park, and a smaller loss by migration. In the fishing townships, where growth and decline have been equally meteoric, there is a larger proportion of persons in permanent employment furth of Park, and migration losses have been greater. It is also significant that there is a smaller natural increase of 0.5 per cent in the agricultural townships. The only township which shows a natural decrease over this period is Calbost, one of the fishing townships.

SEAFORTHHEAD AND SHIELDERNISH

Rachel A. Hirst

Seaforthhead and Shieldernish are separated by 4,485 acres of rough grazing, the former lying on the northern shore of Loch Seaforth and the latter on the southern shore of Loch Erisort.

SEAFORTHHEAD

Seaforthhead, the most isolated of all the Park townships, consists of three crofts and a gamekeeper's holding. The township boundary is situated between the 50 and 75 foot contours which at their furthest extent are only 150 yards from the shore. Immediately behind the road the land rises very steeply in rough uncultivable moorland covered with many boulders but generally below the road the land slopes gently at about 5-10 degrees, in places being completely flat. Here, however, the lazy-beds are very boggy and rushes have appeared in the ten years since cultivation ceased.

The soils are deep near the shore due to soil creep; higher up they are very thin and peat accumulates to at least 3 feet both below and above the road. There is little cover; bracken is rare, but silverweed and heather, moorland sedges and grasses soon colonise disused lazy-beds.

Legally there are three crofts but only one is still cropped, the other two being used solely for grazing. There is, however, a gamekeeper's holding within the township boundary worked as a croft. The other two crofts are used as ancillary grazings to holdings in Airidhvruach and Balallan and have not been lived on for forty years and ten years respectively.

The chief crops are oats and potatoes, though the gamekeeper had a patch of turnips and the other croft had grown them during the last few years until 'finger and toe' developed. Patches, about half an acre in extent, are drained with stone drains and ploughed by tractor, after which potatoes are grown to clean the soil, followed by oats for one year and then sown hay for three to four years. This is not strictly adhered to and several lazy-beds appeared to be in natural hay. There is no peat-cutting on the crofts as peat is secured just outside the township fence on the common pasture. Lambing has been poor for the past two years being only 50 per cent in 1958; the stock carried is twice the sheep soum. The cattle, Highland and Ayrshire or Shorthorn crosses, are below the soum, but previously nine cows and followers have been kept.

There has been a great decrease in population and cultivation since the resettlement in 1886. In Seaforthhead and Shieldernish as a whole, there were twelve crofters before the

[Habost]

134 Drift is found near the shore and laps round the three hills nearly up to the road, predominantly heavy clay with small boulders; this is replaced above the road by peaty loam on rock. At one time, here was grown on the heavy drift. There is peat accumulation on the flat land near the road to a depth of about six feet and there are one or two peat banks.
137 Vegetation is poor; there is no bracken or cover and within the crofts, moorland grasses and sedges predominate on rough land, though there are many lazy-beds sown down to clover and cocks foot. On the hills heather predominates.

195 Habost is the oldest township in Park. In 1843 Maclennan came from Shieldernish and
692 took what are now Nos. 9, 10, 11, 12 and 13 and Ailean Tailear came from Taransay, Harris,
621 to No. 7. By 1886 there were thirteen crofts; in 1907 four cottars were recorded, three being there before 1886; in 1957, No. 11 which had been shared between two brothers since 1906, became legally 11A and 11B making fourteen crofts. There are also fourteen operative units although two are worked from Kershader, both as 'hay and grazing' units, and two are worked as one unit within the township, for there are three non-crofting units.

241 Only sixteen lazy-beds are dug by spade, the rest have been drained with stone drains and
409 ploughed by tractor owned by one crofter who loans it out to Habost and Kershader. There are three 'Croftmasters' (hand-tractors) in the township but these are only heavy enough for
233 bringing in peats, hay and similar light work. The progressive Habost community has fenced off part of the common grazing, to keep the weaned lambs off the croft from August till November and so save fodder for winter when the croft land is open to grazing.

[244] Oats and potatoes alternate in the rotation, with a little sown grass for hay, sown in enclosed
[246] parks of about one acre. The tendency now is to increase the number of parks, cut the hay in
231 June and build up the lambs on the new grass. Shell-sand is used to fertilise the parks but
[324] elsewhere artificials, such as superphosphates, 'potato manure', potash, nitro-chalk and lime are used in addition to dung and, near the shore, seaweed. Most of the hay is taken from old lazy-beds.

231 The land is heavily overstocked: the soum is equivalent to 79 cow units, and actual stock is
233 144, whilst the figures for sheep are 191 and 618 respectively, including the sheep stocked in
[432] Park Deer Forest by seven of the Habost tenants. Sales of cattle are held at Garyvard in Novembe
[221] and May and sheep and lambs are sold in Stornoway. Lambing was poor in 1958, 50-75 per cent being general, but many breeding ewes and other sheep have died.

241 The only cultivation on the common land belongs to the unofficial holdings. Behind Craigeal, however, there are some old lazy-beds, a well and ruins of a hut, which has not been used since
[311] before 1852. There used to be shielings on the far side of the common on Beinn Bhuidhe and
226 below Loch na Ciste but these have not been used since 1888. Habost is one of the agricultural
[282] townships and fishing is only for domestic use; looms are to be found on only four crofts and
[493] trade is slack. One crofter has a lorry for contracting, carrying peats, fertilisers and stock to market and two have butcher's rounds in Lochs. There are two small stores.

361 Settlement is scattered, always on elevated ground, and in many cases the new house has
[512] been built in close proximity to the old house site. All have piped water either from the well or
[654] from a rain tank, drinking water being carried in the latter case. Grants from the Crofting Commission are enabling new building and improvements to be carried out.

[Habost] [Kershader]

Of the 53 residents, 19 are over 65 and only 5 under 15 years, leaving a working population of 29: seven are in permanent employment elsewhere. The population has been steadily declining since its peak of 121 in 1901.

Since 1946, the township has changed considerably. It has been completely fenced and the method of cultivation has changed from spade and horse-plough to tractor and cultivators. A shelter (once has been erected for a lamb park and much land has been re-seeded; an increasing area has been put down to hay. It would seem that fattening of stock for market is intended, and better attention is being paid to stock. Yet the population is ageing and there are few young men to take the place of the older crofters; when working units become larger and stock decreases to a figure nearer the real carrying capacity of the grazing, the croft could become a profitable concern: at the moment, the croft is only maintained through grants and ancillary earnings. Should that happen, however, there must be more re-seeding and an increase of cultivation to provide winter fodder.

KERSHADER

Philip W. Wheeler, M. A.

Kershader is a township of forty-three permanent residents on thirteen crofts, which stretch for a mile along the southern shore of Loch Erisort. The crofts extend up to one-third of a mile from the coast with a two-and-a-half mile deep hinterland of common grazing. The extreme elevation is 270 feet and the average from 125 feet to 175 feet, but the crofts, mostly arranged in rectangular strips at right angles to the coast, are lower (maximum 125 feet) and include three main zones (Fig. 8):

(a) From the low cliffs of the shore to the road, approximately, a zone mainly below 50 feet, dissected by four rejuvenated valleys. The soils of the greater part of this zone have a distinctive profile and tend to be moderately heavy, wet, and unsuited to fertilisation by seaware. The smaller hillocks in this zone have thinner soils of the same sort, but the main hill (crofts 10/11) is an extension of zone (c).

(b) A zone between 50 feet and 75 feet with hills rising to over 100 feet. The lower areas have varied soils, easily fertilised, and intermediate in type between those of (a) and (b), with peaty-loam characteristics, overlying aquiferous gravels. The higher areas have thinner soils of the same kind with poor grassy pasture; in places there are signs of former skinning.

(c) A zone of hollows with deep moss soils requiring intensive drainage and reacting well to heavy fertilisation with seaware and intervening heights covered with thin soil, bog, partly skinned, heather and grass. This zone passes into the common grazing.

Crofts 10, 11 and 12, irregular in disposition, have a steep coast line with gentler slopes over 50 feet; crofts 2 to 8, steep slopes in parts of zone (b), and crofts 1 and 9, again of irregular shape, are intermediate (Fig. 5).

In Kershader, there are thirteen legal crofts and twelve operative units. The crofts vary between 4.4 and 18 acres, with a maximum of 3 acres reputed arable. In all, there are 23.45 acres reputed arable and 110.35 acres outrun. 24.5 acres are in lazy-beds under crop (oats 18.5, potatoes 6.0), and 9.5 acres under sown grass; and of the remaining 99.8 acres, mainly natural grass

[Kershader]

with heather and peat on the higher areas, hay is taken off 19.25 acres. Four acres, mainly for potatoes, are worked by spade but most of the cultivation is by tractor hired from Baliallan, or, in 1958, from Habost. Lazybeds are common and in some cases are carefully renewed, but the present tendency, reaching its extreme in a field of about two acres on one croft, is towards the formation of larger, ploughable fields for ease of tractor operation. Most cultivation is in zones (a) and (b), with little development of (c) at present. The only crops are oats and potatoes, with some cabbages, plots of cabbages, turnips and carrots. The potato main crop is generally Kerr's Pink (Golden Wonder on one croft), with a couple of rows of Skerry Blue or Edzell Blue for earlies. There is no memory of Black Oats (Avena strigosa), and bere (Hordeum vulgare) has certainly not been grown since 1930, and probably not since 1909. The oats are grown exclusively for winter feed and are hand-threshed with stock and comb as the need arises; the last water mill in the locality went out of use after 1914, the last handmill in 1916; no grain has been sent to Stornoway since about 1930. Rotations are extremely irregular: some lazy-beds are still cultivated with alternate crops of oats and potatoes and have heavy seaware and manure fertilisation, but most other arable areas have some sort of oats, potatoes, oats, sown grass sequence. Fertilisers used are seaware and manure (ten crofts), manure (eleven crofts), shell sand (one croft), lime (ten crofts) and artificials - 'Potato manure' and sulphate of ammonia - on eight crofts. Artificial fertilisers and much of the seed are obtained through the Crofters' Agency.

The only two horses ever owned by this township were kept on croft 11 from 1936 to 1953. The plough was introduced in 1936. When a tractor from Baliallan became available for hiring in 1953, the horses were disposed of. The present sowms are by cow, young beast and sheep per croft in proportion to rents and range from 3 cows, 3 young beasts, 69 sheep down to 1 cow, 1 young beast and 7 sheep. Eight crofts exceed their settlement but no croft has less than half the sowming and the deficiency is mainly in cattle, especially young beasts. On the other hand, no operative unit is entirely without cattle as manure is extremely important. Cattle are kept for domestic milk supply, and calves, having qualified for subsidy, are normally sold at 6 to 8 months. 10 acres of the common grazing were re-seeded in 1957 and the following rhythm for milk cows is developing:-

(a) As soon as the weather allows in May, the cows are put out in the park for about three weeks.

(b) Next, about 6 weeks are spent on the common grazing between the ring fence and the new outer fence erected in 1957.

(c) Back to the re-seeded park for about five weeks.

(d) Return to the crofts for the winter, being let out either to the park or to the common grazings whenever the weather is suitable.

The young beasts spend much of their time on the outer common grazings. As most of the crofts, beginning with one in 1938 and ending in sequence with 10, 11 and 12 probably in 1959, are fenced, the old arrangements for township commoning from 15th October to 10th May are now obsolescent. Another park was also fenced for general purposes and for weaning in 1957. Prices for calves and cattle are very low and this discourages cattle breeding; on the other hand, lack of winter keep enforces an occasional sale.

The rhythm of sheep husbandry is largely independent of that of cattle:-

(a) By 20th November all sheep, except possibly the ewes, are cleared from the crofts for the tupping of breeding ewes thereon till 31st December. Every crofter now keeps his own ram, exchanging it or buying another at least once in five years.

[Garyvard]

Only a fraction of the total arable land is cultivated by tractor and this is divided among seven crofts. In spite of an emphatic statement by one of these cultivators to the effect that he will never use it again, the use of the tractor will increase as soon as the pioneers are able to prove to their neighbours its capabilities and as soon as the lazy-beds are joined together, an improvement which has already taken place in Habost. The main objection to the use of the tractor by the unappointed user was the inevitable one that the yields were smaller than in former years when he had used the spade. The answer to this was given by one of the other pioneers, who thought that time saved could be devoted to some other profitable occupation, for example, weaving. Six of the crofters practise a five-year crop rotation, sowing potatoes first, followed by oats under-sown with clover which for the following three years is cut for hay.

An interesting experiment has been that of the improvement of two acres of common grazing land by the road on the west side of the township, by nine of the crofters working together during the evenings. The work began early in Spring when 6 tons of lime, 10 cwts. of mineral phosphates and 8 cwts. of compound fertiliser were spread only over the land. The grass seed was sown in July, the most favourable time for sowing since there is less danger of a drought than earlier in the year, and more convenient too, in that the sheep had been gathered for shearing and 250 of them were available to be driven back and forth over the land to tramp the seeds in. In theory this land should be ready for grazing next Spring, but in practice it will be ready in November. It is planned to re-seed twelve acres in all.

Most crofters have a cow to provide milk for their own needs. The Black Poll bull at Gravir is preferred to the other township bulls since its progeny command higher prices. Sales are held in the district twice per year, once on the old lazy-level on the east side of the township, and once at Baliallan. Prices for calves are normally better in Spring than at the Autumn sale, nevertheless prices offered tend to be low. Even so, it is usually to the advantage of the crofter to part with the animal rather than bear the cost of taking it back to the croft and keeping it there. Historically there is some bitterness that the middlemen who buy these animals will sell them at much higher prices on the mainland at Dingwall. Sheep are normally sold in Stornoway to the butchers but also at the local sales.

Crofting is not in itself a lucrative form of employment and in most households there is at least one other source of income. A majority of the crofters have regular employment, two working in quarries or on the roads for the County Council, another is postman, three are weavers, another both weaver and contractor, while yet another works in Antarctic waters aboard a whaling factory ship for eight months of the year. Weaving is undoubtedly the most lucrative of the ancillary occupations, though the weavers are suffering at the moment from the slump in the Harris Tweed industry which is also affecting the prices for wool. Contracting is also a paying proposition for one or two persons only, since the amount of freight is obviously limited.

Most crofters own a small rowing boat and it is not uncommon to see half a dozen nets set to catch mackeral and other demersal fish. There is not one large fishing boat, however, partly because of the scarcity of fish near the coasts, and partly because of the isolation of Ness and the subsequent difficulty in marketing. The Fleetwood trawlers are regarded as pirates in the Minch, and one has to its credit the destruction of two long lines - the sum total of the tackle belonging to a local boat. To have eighteen pounds worth of gear lost in one night is ruin to a crofter-fisherman. Lobster fishing has died out at Garyvard though it could be quite extensively practised.

The main road from South Lochs to Stornoway through the village has obviously had a profound effect on the township. The sites of the old 'black houses' have been abandoned when new houses have been built in the vicinity of new sites on the coastal strip near to the road. The Road Age has greatly limited man's capacity for carrying goods. This is well illustrated by the fact that the majority of crofters in Garyvard use artificial fertilisers, whereas they are scarcely used at all in Caverata where the road ends about 50 yards from the nearest house.

[Caverata]

Each croft is fenced but has a gate giving access to the common grazing, in which each crofter holds an equal share. The township has no specially enclosed area for lambing or other purposes and no fixed date exists on which the crofters open their gates for winter grazing. Breeding ewes are normally brought in for tupping in mid-October and November when crops have been gathered, and lambing takes place in late March or April. After dipping and inoculation with vaccines for black leg, braxy and louping ill, the sheep are put out on the common grazing in the second or third week of May.

The 642 acres of common pasture support a sheep stock equal to the sheep sowm, but the overall stocking is only 88 per cent of the total sowming. The two crofts with the highest stocking are those while the others are well below the number required for greatest efficiency. The grazing is, however, poor for summer pasture, owing to the lack of grass, but the heather is valuable for wintering the hoggs. Lewis Blackface sheep are the predominant breed and the wool, clipped in July, is sold to the Stornoway mills and the animals themselves are sent to the slaughter house. The 1958 loss at lambing was exceptionally high owing to a cold, dry spring preventing the growth of grass for the ewes. More than forty lambs and thirty ewes were lost by the township last winter, a number four or five times greater than the average loss.

Six cows, two heifers and four calves are kept in the township and tethered most of the year on the croftes. Calves are born throughout the summer months, but whereas early-born calves may be sold in the Autumn at six months old, those born later must be wintered to eight months until the Spring sales. The cows are served by the Department of Agriculture Highland bull at Habost, but although good prices are obtained for beef cattle, it is felt that for the family milk supply, a dairy bull would produce a better strain.

In addition to keeping stock, oats are cultivated on five holdings and potatoes on six. In most cases the land under each crop is less than half an acre and nowhere does it exceed two acres. The land has been built up into lazybeds about six to ten feet wide, separated by open drainage channels and worked by the spade. There are only two holdings where a tractor (hired from Habost) is used and the acreage cultivated only amounts to three-quarters of an acre. Conditions are not altogether suitable for mechanisation at present, for the terrain is very uneven and broken up by marsh and steep faces of bare rock.

Neither Torista nor Caverata is on a main road. The former is served by a track joining the road near Cromore, while the latter has a secondary road running as far as the township dyke, and an inferior footpath joining the main road at Garyvard. The lack of a good road within the dyke acts as a deterrent to the use of modern equipment and fertilisers. Byre manure is used on all the crofts and seaweed is brought from the shore and spread on the lazybeds. Artificial manures, used on only three crofts, must be carried over rough ground from the dyke. This lack of incentive to improve is perhaps even more marked by the fact that on one holding alone is a rotation practised - potatoes, oats undersown with clover; then hay for three or four years. Apart from this one instance, potatoes and oats are sown, perhaps alternately, on the same strips for many years. Natural grass yields the bulk of the hay and is often cut from lazybeds that were formerly cultivated. On one croft there is upwards of quarter of an acre where the old ridge can be seen to have a crescentic shape and are thought to date back more than one hundred years. A short distance beyond the township dyke is a similar stretch of land, now colonised by heather.

Peat still forms the principal fuel and, apart from one half acre patch within the dyke, is cut on the common grazing, as near the road as possible in May and June, and later brought home by creel, bicycle or tractor. Three of the six operative units still have gardens and all keep up to twenty chickens; rowing boats for line fishing, solely to supplement the larders, are also maintained.

In 1841 population records show that there were twenty-two persons at Caverata and seven at Torista. After 1881, when maximum figures of fifty-nine and nineteen were noted, there was a secondary peak in 1911 in Caverata, followed by a steady drop to twenty in 1951 and eighteen in 1958.

[Garyvard]

The West Highland Survey Township Card[1] describes Garyvard - predominantly a fishing township". The remains of an old curing station are visible today and until 1947 there were twelve boats operating from Lemreway. A declining market, increasing cost of gear for obsolescent boats and the lack of a landing stage led to the decline of the industry in this township. Today there is one fishing boat which lands its catch in Stornoway: working with modern equipment, drift and ring nets, it provides a regular income for a crew of six.

An examination of the population statistics proves interesting, especially when compared with those for Grimsay. Lemreway's resident population of just over 70 males and 70 females is large considering that there are six unoccupied crofts. Eleven of the crofts have more than one house and the cottar population forms over a third of the total resident population. Yet the two important age groups - between 15 and 64. With over forty resident males in the working age group, Lemreway provides a striking contrast to other crofting townships in Park.

Fourteen of these men are full-time croft workers, while nine others find work in ancillary occupations such as weaving and fishing. A further eight supplement their croft work with regular employment - as postmaster and a postman, a bus driver, a lorry driver and several weavers. Just over thirty people work away from the township permanently, fourteen in the Merchant Navy and nine girls in domestic service, while a further nine engage in seasonal work.

Emigration from the township has continued steadily with forty people leaving since 1939. Nevertheless, Lemreway has a larger proportionate resident population than most townships.

Only four thatched houses are occupied and housing conditions generally are good. Every house has electricity, but, with four exceptions, water has to be carried from springs and wells. Most of the present houses were constructed in the 1930s and they are usually near to the road. Some of the old houses remain, some being used as byres and others were built either along the shore or up the slope in the shelter of the hills, where the house was near the sheep, the peat and the springs. Today supplies of food, peat and even seaweed are brought by road.

Mention must be made of the possibilities of the tourist trade in Lemreway with its most attractive situation and reasonable road connections. An approach has been made to the Scottish Youth Hostels Association and while hostellers could not greatly increase the income of the residents, they would stimulate interest in the area. Accommodation for summer visitors, other than relatives of the crofters, is difficult to find but it seems that at least one house could be used.

It is possible to be optimistic about the future of Lemreway, as at the moment considerable enterprise is being shown. A Ferguson tractor, bought this year by a man returning from whaling, is an example. It is to be hired out and could be put to good use in some parts, especially on the outend. The attempt to improve the common pasture and the new extensions to neatly painted houses also reflect a combined effort to improve conditions. The old economy of crofter-fisherman is being adapted to modern times and crofter-weaver, crofter-postman and crofter-bus driver are the contemporary employment combinations.

The pessimism and apathy noticed in many crofters is to be found in Lemreway but above this is the impression of enterprise. If Lemreway can continue to adapt itself to changing conditions, it may be able to combat the 'drift to Glasgow' and continue as a successful community.

GRIMSAY

Beth Blowers, Brenda Turner and John Wearmouth

Grimsay is a small crofting township clustered, in the form of a horseshoe, around the head of a sheltered bay on the northern side of Loch Skiol. Most of the houses are situated within fifty yards of the shore on a narrow strip of level land, while the crofts extend from the shore on to the moor

1. The Directors of the Crofting Survey are grateful to Dr. F. Fraser Darling for granting access to the individual Township Cards, which are a storehouse of information. For detailed contents of the cards, see West Highland Survey p. 247.

412

412 GENERAL TOOLS--cutting tools (e.g., knife, ax, adze, chisel, wedge, plane, scissors, saw, sickle); boring tools (e.g., awl, needle, drill, augur, bit, reamer); abrading tools (e.g., scraper, file, grindstone); striking tools (e.g., maul, hammer, pestle); eating utensils (e.g., knife, fork, spoon); digging tools (e.g., digging stick, spade, pick, hoe, shovel); gripping tools (e.g., tongs, tweezers, pincers, vise, grapnel, wrench); miscellaneous tools of general utility (e.g., broom, brush, fan, comb, rake, fork); parts and their assembly (e.g., blades, handles); See also:
Lashings . . . . . 284 Hardware manufacture 391

233 127
234
435 costly, that the Common Market will soon drive up milk
434 prices, and that income from the weaving has become too
648 uncertain.

412 Many tools and techniques associated with crofting
178 have disappeared: the flail for threshing oats (two pieces of wood joined with leather); the sheepskin stretched over wood with holes burned into it, to separate chaff and grain; rope made of plaited heather and straw. Each spring the byre was cleaned of its accumulated dung
241 [221] and urine, and this was turned into the ground along
[237] [324] with seaweed. Such tools and techniques remain among
[173] the older villagers as a "memory culture" which may be
[387] mobilized under changed conditions, as when alternatives to crofting are no longer available or are too costly. However, the longer crofting is neglected, the less it will provide an alternative strategy. "The artificial
241 fertilizers are ruining the land; that's why the
824 turnips are full of maggots and the potatoes turn to
[233] water." As the rushes grow and clog the drains and streams--rushes that used to be eaten by the horses and cattle and which are now left untouched by the sheep—the land becomes unfit even for grazing. "I'd rather work the land than the blinkin' loom, but we tried the potatoes, turnips and cabbage last year, and lost them all to the maggots. You lose heart after that."

AGRICULTURE AND FISHING

*175 islanders' manufacture of cloth. The inhabitants were at least a
241 century behind the times, though they were, he found, in no way
134 deficient by nature. They were social in their own style, and they
311 had very good heads, 'that is, for people not accustomed to habits
[181] of thought'. So far as agriculture was concerned, nothing in the way of draining the land had ever been accomplished; nor had any effort been made to penetrate the hard sub-soil. He held that
[137] the great scarcity of timber had been a serious handicap when
• [412] it came to agricultural implements—to their renewal, repair or possible improvement. Under direction, however, he was convinced that improvements in land use would result in considerable benefits to the island. He added that he hoped the period of this improvement would not be far off and that visitors would find 'a green, pastoral land instead of a dreary waste'.

*175 Yet not until 1928 was peat reclamation and development
242 again brought out for an airing. This time, the benefactor was
134 the late Mr T. B. MacAulay, a Montreal magnate, a son of Lewis
311 connections. He gave £10,000 to establish an experimental farm in Lewis, and a site on Arnish moor, not far from Stornoway, was chosen. It was typical of most of Lewis: black, water-holding peat, which when squeezed, instead of allowing water to escape from it like a sponge, oozes itself through the fingers. The aims of the farm were to provide additional arable land on which to grow winter fodder, and to improve, at as low a cost as possible, the grazing on the moorland. Fifty acres were certainly converted from moorland to arable, and this formed a basis for an experimental extension to another 100 acres. By 1936 the farm had a sales income from produce of about £1,400. The stock in that
[231] year included 40 head of thriving cattle, including 15 dairy cows, 20 poultry, 140 blackfaced sheep, and some fattening pigs. The sheep were a late addition, made with the dual aim of pasturing on moorland too deep and soft for cattle in wet weather, and of improving the sheep strain of the island.

By 1938, it had been shown that some lasting improvement on moorland of reasonably favourable slope could be effected at a materials cost of about £3 per acre, and without heavy labour costs. Thus, the common grazings held by the crofting townships could be improved, if a co-operative effort were organized. So

178 241 476 of the normal capitalist farmer in the West; but in crofting areas, these practices reveal a strain between communal and individual tendencies.

a. Fencing:

233 Although run-rig was replaced by fixed, compact [178] holdings, the method of animal husbandry was not affected [417] until the land began to be fenced. A single dry-stone [333] dike enclosed the township, keeping livestock on the moor and away from the arable land. In different parts [184] of the Hebrides, various types of herdsmen were hired to protect both the livestock and the growing crops (cf. Owen 1958-59 for a discussion of cattle, calf and sheep herdsmen in North Uist).

175 625 The township Constable had a great deal of power, which included the right to evict people from their crofts, to enforce rules of good husbandry. The last Constable of Shawbost, who died at the turn of the century, has been credited with a number of ignoble actions, such as forcing an old woman with a sore leg to take her cow to the moor along with all the others. Old widows who had no one going to the fishing and hence no means of paying their rent might be evicted in favor of other persuasive, land-hungry members of the village.

175 311 233 township, but on land which had been rested and which thus provided better grazing. During the winter the [221] sheep were allowed past the township dike, to graze along with the other livestock on the stubble of corn and barley, and mineral-rich seaweed by the shore.

175 178 311 417 233 After World War II, the individual crofts began to be fenced, and the township dike was no longer repaired. The fact that sheep were still grazed communally on the moor meant that everyone had to go out together on a particular day rather than individual but fencing of individual land facilitated variability in land use. Less use was made of crofts for raising crops, and they could be used for grazing sheep all year round.

b. Reseeding schemes and apportionments:

178 311 Another illustration of the individuation of land [241] use is provided by comparing the number of apportionment granted by the Crofters Commission for Lewis in the last 10 years with the number of township reseeding schemes carried out during the same time (see Table IV).[1] A [425] crofter may apply to the Commission for an area of land (apportionment) to be sliced out of the township's common grazing land and given to him for his own use; theoretically, his share in the township's common grazin land is reduced if his application is granted.

1. [See p.x--Analyst]

lambing season, the crofter and his family go out on the moor to cut their peat for the following winter. The man uses a "tusker," a two-bladed spade, to cut the peat. His wife or his children follow behind, tossing the peats out of the ditch and building small, loose stacks for drying. After the lambs have been marked and the sheep dipped in June and the shearing finished in July, the family returns to the banks to carry the peats to the nearest road, actually a beaten cart path, in creels. They are then carted home and stacked near the door. There is a growing tendency for both the part-time and spare-time crofter to give up cutting peat. It is not because coal is cheaper or he needs time for other pressing chores. His auxiliary occupation will not permit his devoting the necessary time to this long and arduous task. He is caught between the traditional economic patterns and the money economy of which he has become a part.

The year for our part-time crofter, as for all active crofters ends in November. By then the oat and hay harvest has been stacked by the house and the potatoes and turnips stored in the ground, the wool shipped off to market, the surplus sheep and cattle have gone to market, and the rams are on the hill. Now follows a period of enforced idleness, broken by feeding the cattle. As we have seen many go away to find employment, leaving the care of the croft to their wives who have shared the work of crofting in addition to their own womanly responsibilities. We must turn to the spare-time crofter to discover just how heavy the burden of labor may depend upon the women of Skye.

A PEAT-CUTTER

The peats are being carried to the roadside from where they will be carried home

later times the landlord might supply timber. Long ago a main source of timber was the shore. The length of the house may be fifty to sixty feet, and the inside breadth ten to twelve feet, spanned by ten or a dozen pairs of couples on which are laid transverse 'cabers', which may be tree trunks, branches, odd wood, old oars, or, exceptionally, sawn timber. The tops of the walls are finished with turf, to keep the filling from being washed out, and to provide a smooth bearing for the couples, the ends of which are pushed into the turf so as to bear on the inner half of the wall; the rounded form and absence of overhanging eaves prevent a gale obtaining purchase on the roof, but a gable with chimney is now usual on the end wall of the inner room. The rafters are annually covered with turf, and the roof is thatched with thin, short barley straw, which was pulled up, not cut, after the ears were picked off, the roots gripping well, and the stem hanging outward and down.

The door gives direct access to the byre (*bathach*), through which one reaches the middle part, or living-room, 'at the fire' (*aig an teine*), from which there opens the inmost part, the 'room' with bed-closets. There is no ceiling to the primitive house, the row of box beds having tops to keep off the drips of rain water. In the middle of the earthen, sanded floor of the living-room is the circular hearth, built of stones with clay between, and raised a few inches, with no chimney.

In the byre, the manure accumulates from spring to spring, and a breach is made in the end of the house for the annual removal of the manure. There are no privies. Where there is fodder and straw in any quantity a barn is added. Stacks are rare because of wind. A low wall, continuous with the house and barn, may enclose the kale-

usually corresponded to six imperial bushels). The stock was "four milch cows, three to perhaps four horses, and as many sheep on the common as the tenant has luck to rear". Although such estimates, especially of crop yields, are apt to err on the favourable side, a comparison with the same writer's statistics of stock (and rental) shows that this estimate gives only a little over the modern average per family in Harris, and allows an average sheep flock of one score ewes.

The briefer Statistical Accounts of Lewis indicate the average stock per family, suggesting comparisons both with the present, and with an earlier time (Chapter II). In 1790 the cattle and horses, though small, were greater in number per family than now. In Lewis there were eight head of cattle per rural family, compared to 2·5 today; there were one or two ponies per family (according to the topography and ploughland of the parish) instead of an average of only one horse to five or six families today; the small family sheep-stock was similar; and there were also some goats, say, one to every second family. In addition to these resources, there was fishing; and the number of boats in Stornoway parish, giving one boat to four families, is a guide for the rest. Fishing, with net-making, was a predominant occupation in all parishes by that time, and boat-building was significant too.

As to changes, fishing had grown in importance since about 1720, and kelp-making added an important new resource. But one may doubt if the Island supported an appreciably larger live-stock in 1790 than seventy years before; one must rather assume smaller shares per family, for population had increased. A basis for agricultural security was an adequate balance of sandy machar to 'black', peaty, clay land; and the area of machar, a limited

175 natural zone, could not be extended. In any case, the re-
433 clamation of clay land tended to slacken as efforts turned
434 to fishing and kelp-making. The introduction or increased
[182] growing of potatoes added to the human, but hardly to the
[311] animal, food supply. Finally, while the beginnings of
[232] medical knowledge and vaccination had aided the growth
[422] of population after 1750, veterinary science had made no
progress, nor did it advance in the Island for many years
to come. We may conclude that an average stock per Island
family about 1720 was rather more than that of 1790, and
the acreage relatively larger, while both were greater than
the average of today, particularly in the Lews.

175 What, then, could a family have to eat, from such crops
262 and stock? While in winter even now there is almost no
244 milk to be had on a croft, and there would be little then,
there was salt meat, dried or salted cod (or herring) and
fish oil; oat and barley meal and some rye meal; cabbages;
and, increasingly in the eighteenth century, potatoes.
Martin included potatoes among the crops grown even on
far St. Kilda in 1697. A century later it was written that
the people of Uig, for instance, had, though 'unwilling',
been induced to grow and eat them 'forty years before';
and the years tend to be under-estimated where changes
are slow and memories long! But it was written of Harris
that by June the meal and potatoes had mostly been con-
sumed, "and such as cannot afford to purchase imported
meal subsist chiefly on the milk of their cows and sheep,
with what fish they may chance to catch, till their wants
are relieved by the first fruits of their potato crops early
in Harvest".

175 We conclude that with even less money but a little
511 more grain the population in the Island had fluctuated
162 about a mean for some centuries before, as it had in so
171

178 exists at Tarbert and another was erected in 'the Bays'
286 district by Leverhulme. Leverhulme also appears to
have introduced 'Automatic' hand-looms into Lewis.
[423] Today as in the past, the weavers possess a little croft or
a feu, a cow, and a few sheep on the outrun, and perhaps
[422] a small boat.

121 Commercial fishing and weaving cannot, however, be
286 satisfactorily combined, for seasonal alternation of occupa-
tion entails waste of gear and plant, and interferes with
228 efficiency. Thus in the North Lochs fishing 'creek'
182 (Leurbost neighbourhood, immediately south of Storno-
way), weaving became important, but none of the seven
178 large herring fishing boats (still registered in 1930) had
been fitted with motors after 1918; they were idle and
[501] rotting, and by 1938 only one was still registered. In South
Lochs, however, motor-boats were purchased, but there
is little weaving. An obvious reason for the difference is
the accessibility of the North Lochs area by road to
[493] Stornoway. Light passenger cars bring yarn to the village,
besides groceries, etc., and take away rolls of tweed. South
Lochs, on the other hand, considerably further from
Stornoway by road, is still within reach for marketing fish.
In North Lochs, merchant seamen at home and young men
on their return from three months' work on East Coast
fishing boats, turned increasingly to the 'Automatic' looms,
manipulation being easily learnt; but such intermittent
work alone gives little hope of progress. There is no more
fascinating problem than the future of improved weaving.

2. *Unemployment and the Island Budget*

174 In the past, the storms of the Atlantic washed up on
731 the Island shores the wreckage of world commerce; and
434

192 The circular, corbelled stone "beehive" huts, some still in good repair, are of uncertai
date. The best preserved are on the Morsgail Deer Forest, in remote situations which
make it almost certain that they were only occupied seasonally; those on the Garynahine
common pasture are associated with assymmetrically ridged, curving, lazybeds. This
however, need not imply permanent occupation of the site, nor does it solve the problem
of age; such lazy-beds are certainly old, possibly pre-potato (c. 1790 here) - but the hu
do not decay with age and may be very much older.

175 Early in the eighteenth century the present area of the parish of Uig was held from t
427 Seaforth clan chief by 26 tacksmen, whose names are recorded in the judicial-rental of
1716, (Fig.4). They, presumably, had sub-tenants but of these there is no record.
Elsewhere in Lewis the same rental records many small tenants holding direct off the
chief but in Uig, apparently, the tacksman and sub-tenant system remained intact.
Although we cannot be certain of their precise extent, the distribution of the tacks
[241] coincides fairly well with that of the better agricultural ground (Fig.2). Five of them
cluster round Uig bay, four were in the Valtos-Reef area, and three around the strait o
Little Bernera. All these districts have machair; together they accounted for three
quarters of the meal and more than half the sheep and money rents. What is more, th
rents represented 27% of the total rental of Lewis, whereas by 1887 Uig yielded only 17
178 of the rental and by 1901 the proportion was reduced to 14%. The relative decline of
365 Uig is largely due to the growth of Stornoway; this shift in the centre of gravity of Lewi
has tended to exaggerate the remoteness and isolation of Uig in the present century.

161 By the end of the eighteenth century the tacksmen seem to have disappeared; at any
175 rate they are not mentioned in the remarkably detailed account of the parish given
in the Old Statistical Account, 1792. Meanwhile the small tenants had multiplied:
whereas in 1755 the old parish * had supported 1,312 persons, in 1792 the
467 minister recorded 1,898. At this time there was neither plough nor cart
494 in the parish. The minister was cultivating potatoes and his family were eating the

422

	1792	1959
Cattle and calves	9.2	2.1
Sheep	13	37
Horses	1.8	-
Goats	0.8	-
No. of families	387	450

Note: the figures for both dates refer to the area of the old parish.

[632] * The old parish of Uig excluded the Loch Carloway district, from Kirivick north; this area lay in Lochs parish until 1891. Unless the old parish is specified figures quoted ha been corrected to conform with the modern boundaries.

1. [See p. 2--Analyst]

Alluvial soils have developed along the lower reaches of Amuinin Thoraghair and the Erista river.

There are no trees apart from an occasional stunted rowan or willow - willows for thatch making grow still in some old garden enclosures. Hedges, too, are rare and, although individual houses are often carefully sited, there is little cover and the township as a whole are very exposed to westerly gales. The natural vegetation developed on the machair is of fine closely noubed grasses with a good deal of natural clover - very similar to that found on chalk downland. On the peaty moorland the usual moor grasses, mosses and heather are dominant, though little encroachment by bracken was noticed.

In Crowlista the strip layout of the croftz dates from a letting about 1855, (Figure 14) in the new township, laid out about 1821 (Figure 15) the majority of the croftz are in late strip-like and do not run to the shore. Indeed in Ardroil and Timsgarry only five out of twenty-two croftz reach the shore and the rocky headlands with their machair are valuable parts of the common pasture. The site croftz in Carsiclet run from the shore at the foot of the esker up its flank towards the southwest and almost to its summit. They also have one or two small plots each on the machair.

Croftz in Ardroil are in one place. An old cattle road forms the north west boundary from this they rise, steeply in places, to undulating moorland just over 200' high. Numbers 5 - 8 Timsgarry are strips across the Erista valley, rising northwards to just over 175'; 2, 3 and 4 are allotted to make use of arable land on the lower slopes of Rocck Valabrie. The houses of croftz No. 1 Timsgarry and No. 1 Ardroil are the former farmhouses.

In Crowlista most of the croftz remain unfenced but in Carsiclet, Ardroil and Timsgarry all are fenced and many of the fences were being repaired or replaced in 1959. They are not open for common grazing during the winter. Patches of sown hay are fenced within each croft.

There are six recognised croft-holdings in Carsiclet; one is sub-let so that there are only five "operative" croftz; two of these are not worked. One has been resumed by the proprietors and is being quarried as an extension of the main quarry between the township dyke and main road. In Ardroil each of the fourteen croftz is worked as a unit - though two carry no stock; in Timsgarry eight croftz are worked as seven units.

In contrast to the above, the old settlement of Crowlista has twenty-five recognised croftz but, by amalgamation and sub-letting there are worked as fourteen units. The Crowlista croftz are small - fourteen are 4.0 acres or less and of these only one is worked as a unit. Croftz as small as 1.5 acres are common in other townships, but never have been intended to support a family; they are the result of sub-division in earlier generations; the remains of two piers and a caving house point to the importance of fishing in the past. Twenty-one men were employed in fishing boats about 1914. Subletting usually takes place between relatives; of some of the fourteen operative units are quite complicated. One example will suffice (croft numbers are here replaced by letters to prevent publication of personal material):-

Croftz a, b, c and d are worked as a unit (although they are not adjacent). The tenant of a and b sub-lets c and d for grazing; he also helps with the work on yet a fifth croft. The present a is half of an original croft. The rest of the original croft is held in fixed rently between i and another croft, one part of this multiple "working" unit east of the road it has been divided into separate strips. The tenant lives on b.

241 here and there in small patches of less than a quarter acre and therefore do not appear in our summaries, appendices A (1) and C (1).

The amount of cultivation carried out depends on three factors:

(i) stock, particularly cattle, to be carried through the winter,
(ii) size of family, which influences the amount of potatoes required,
(iii) available labour, because cultivation is mostly by hand, especially in South Uig and Berneray.

The size of the effective agricultural unit has little influence on the area cultivated although it may have some relation to the amount of natural hay taken. This can hardly be regarded as "cultivated" and the acreage is difficult to estimate; the custom is to cut as and where needed, sometimes on the hill and elsewhere in a convenient stand of natural grass.

Hand labour is a necessity on most croftz in the Bernera district and on many elsewhere. The traditional "lazy-bed" - a form of ridge and furrow cultivation bounded by deep ditches which may be half a metre wide - is a necessity on broken, rocky ground on which the rocky surface is not which often has to be gathered into heaps in order to get enough soil to cover it. The small size and long narrow shape of most croftz do not lend to get rid of the drainage, which is also important. If it could be extended it would be a great advantage but, in general, it would have to be organized by townships, or at least by groups of croftz, and the whole trend in management of croft land is towards individual occupation and use.

This may not always be a good thing. Fencing is a case in point. Until the last two years fenced croftz were rare and most small parts of croftz might be fenced and, in some cases, a group of croftz might be fenced off from the rest. But, in general, the croftz were commonly unfenced in winter and used individually only from May to October. Fencing grants, and the encouragement of sown grass in rotation with oats, have changed all this. A great rash of fencing is appearing. This may not be altogether a good thing, particularly for the sheep in winter and spring; even if grass are still left open, stock are deprived of the ability to move for shelter. There may also be watering difficulties. Co-operative drainage, cultivation and grazing, of groups of croftz if not of townships, would be more efficient and more productive.

Finally, we may remark on the contrast between the land cultivation of oats and potatoes for consumption on the croft, in which small crops well suited to hand labour, and which would be far more rewarding if they were neglected. However, oats and potatoes are imported and generally fully on the mail steamer and even by yatses. Neither are important and generate little production in Lewis. Moreover such crops could provide a much needed source of additional income. A few croft gardens produce excellent soft fruit and as the lands warm differ slightly from that on the mainland there would seem to be possibilities here, too. There have been virtually no agricultural innovations since the photos.

Agricultural and Technical Factors.

The agricultural income of a croft arises from:

(i) the sale of livestock, mostly store stock at the spring and autumn sales.
(ii) the sale of the annual wool clip.
(iii) the receipt of certain annual subsidies and grants.

These are the main items; in addition some may sell small amounts of potatoes, eggs and standing hay; a very few sell a little milk although strictly this is illegal. Such an annual income comes in three or four annual instalments, uncertain as to date and amount. Occasionally some croftar may suddenly and unexpectedly find himself deprived of a large part of his income due to casualties amongst his stock or poor demand at the seasonal sales. Unlike the mainland farmer, should an islander withdraw his store

421

421 PROPERTY SYSTEM--principles of property law; rights, privileges, and powers commonly involved in property relations (e.g., rights that others shall not use or destroy, privileges of enjoyment, powers of alienation and of transmission after death; recognized types of tenure; tenures; recognized types of ownership (e.g., individual, joint, corporate, collective, public); their relations to classes of subject matter (e.g., land, movables, slaves); their degree of integration; their legal and statistical importance; their association with kin and other social groups; etc. See also:

1[illegible]	...	87	Property arrangements upon
Ownership of productive capital	...	471	termination of marriage ... 508

Nevertheless, the attachment to the holdings is very real and must be given careful consideration when assessing their present utilisation and potential value. It is particularly significant because it leads to large numbers of tenants retaining holdings which are far too small to yield a living. Inevitably they seek other sources of income either at home by working or crofting or elsewhere by seasonal work (e.g. Seasonal Navy, armed forces, police or other skilled or unskilled work). As a consequence the croft is neglected and its potential resources, small as they are, are not realised. The decline in crofter numbers since the late nineteenth century gives some indication of the scale of this lost productivity over the parish as a whole. This is the crofter's own loss. Individually one can appreciate the problem - "four cows will not give me a living - better to get work on the Forestry Commission and be sure of a living." And one hears frequently that another will take its place, or there will be casual road work or other labour and, between times, the croft and crofting will be small enough to benefit which the self-employed crofter does not.

Certainly the land is of poor quality, the climate is some respects severe, and the cost of transport, from Uig even to Portnaway let alone to the mainland, a perpetual problem. But the root of the problem is the small size of most of the crofter-holdings, on the one hand, and, on the other, the fragmentation of holdings into several pieces of a holding, no matter how small and how neglected it may be. How has this come to be?

TABLE 5

The multiplication of crofter-tenants, and their increasing rents, 1850-1890.

hinterland with the outside world, Portree is a center for tourists during the summer. Due to the people's dependence on tourism and also the presence of newcomers, the villagers participate in a number of social activities which are not tolerated elsewhere on the island because of religious asceticism.

Glendale and Kilmuir are crofting communities, each with population of about 300. All, except the ministers and school teachers, are dependent on the breeding of cattle and sheep and the growing of a limited amount of grain, potatoes and hay for all or a large part of their livelihood. All are bilingual, speaking Gaelic and English. Neither community has a village nucleus, but both have an economic focus. Glendale has a cooperative farm, and Kilmuir has a drained loch which has been divided among the small farmers. The significant differences between these are three. The Glendale people are hand owners. In this respect they are rather unique in the Highlands. The Kilmuir residents, like most Highlanders, rent their crofts. The second difference is religious. Glendale is religiously homogeneous while Kilmuir includes church-goers of three Presbyterian sects. Finally, no formal social activities other than an annual meeting of the share-holders in the farm is allowed in Glendale, but Kilmuir has a club organization for the men who gather for lectures and discussions of economic problems.

of the tacksmen. Here was the essence of the clan system, the common tie of territory and kinship. The land was not the means of subsistence, it was the ancestral house.

The clan was strongly patrilineal. The father of the individual family stood to his children as the senior member of the *farbrion* to his kinsmen, the tacksmen to his followers, and the chief to the body of the clan. The fundamental underlying principle was mutual, reciprocal devotion. The system was equalitarian. Although the chief was the landowner, and the tacksmen received their land on lease, for which they owed the chief the duties of service and a rent just as their tenants owed the tacksmen, the land had no commercial value. Rent was an ill defined and secondary consideration. The dignity of the chief depended on the number of supporters, who could be maintained on the land under the system of land use.

Economic Activities

The principles of land use and tenure on the Isle of Skye up to the early years of the eighteenth century were similar to those prevailing all over Scotland.[59] The land was used under a system of runrig agriculture. The word runrig appears to be a modification of the Gaelic *roinn-roith*, a parallel or running division. The bulk of the population, as tenants of the land owning clan chief (or Lowland aristocrat) or subtenants of the lleaseholders, was clustered into hamlet-like farming settlements to exploit the arable, pasture, and grazing lands by individual and cooperative effort. The land suitable for cultivation was divided into infield and outfield. Since Ireland and Wales continued to use shifting arable, and England adopted permanent arable in the Middle Ages, the practice of dividing the land into two separate allotments must have been introduced by the Norse. Norway continues to use infield and outfield to the present day.

The infield, about one third of the arable land, was farmed continuously with the aid of manure. The outfield was worked until exhausted and then left fallow while a new piece was brought into cultivation. Both were split into "rigs," irregular strips about twenty feet wide and several hundred feet long, separated by "balks," any uncultivated patch. Each man had at least three rigs for his use. Annually, all exchanged at least one rig with the other holders by ballot. Since all of the land was not of equal value, this periodic redistribution gave each man an opportunity to have the use of the best soil every three years. The use of the pasture and grazing lands was regulated by a system of common rights. The stock of each individual was proportionate to his share in the arable land. When arbitration was needed to decide questions of allotment, grazing rights, or rent, a "birley court," composed of the share-holders and their elected constacle, was held. Economically, each farm appears to have

[59] Henry Grey Graham, The Social Life of Scotland in the Eighteenth Century (3rd ed.) (London: A&C: 1ON Charles Black, 1906), pp. 154-165; Malcolm Gray, "The Abolition of Runrig in the Highlands of Scotland," The Economic History Review, Vol. V, No. 1 (1953), pp. 46-57; and James Z. Anthony, Scottish Farming in the Nineteenth Century (London: Faber and Faber, Ltd., 1953), pp. 34-73, 91-100.

some townships the large crofter is given an allocation in 427
proportion to his rent. The payment of his rent also entitles 423
the crofter to gather seaweed along the coast for fertilizer 423
and to cut peat for fuel on the common grazing or in special 347
peat areas. In a number of townships he has a further right 233
to pasture his rams in a "tup park" and his horses in a "horse park." These are lowlying areas of improved pasture. There is the general picture.

There are three important exceptions to the typical 427
means of land tenure. First, there are the Glendale crofters 423
who own their land. Each individual has purchased his croft, 421
and the members of each township own the common grazing collectively. Before the law they are no longer entitled to the 650
benefits of crofting status because, by legal definition, the crofter is a small farmer who rents his land. Second, there 233
are the crofters of six Kilmuir townships who have individual areas of "outrun," good lowlying cattle pastures, in addition to the normal crofter's holding. Even though the Glendale crofters are landowners and the Kilmuir crofters have their own cattle pasture, they are subject to "souming" regulations. Third, there are a few large, isolated crofts which are self-contained units. The individual has his own cultivated land, pasture, and rough grazing. In reality, many of these large holdings are farms, but as long as the annual rent does not exceed £50, the benefits of crofting status are not withdrawn. The crofter, of course, stocks his holding as he thinks best. While the Irish and Scottish Highland systems of land use

While
the Irish and Scottish Highland systems of land use
427 reveal many underlying similarities, they are distinguished
423 by their respective systems of land tenure. The Irish small
421 farmer owns his land, like the Glendale crofters, and has a self-contained holding, like the large crofter on Skye.[3]

427 Croft Size. As the foregoing discussion has suggested, there is a wide range of croft sizes. Some crofters have only a few hundred square yards of the poorest soil. A few have large, relatively fertile holdings. One of these large crofters, for example, has 88 acres of arable land, 27 acres of pasture, and 1261 acres of grazing. The most common size is less than five acres, and not more than 500 of the 2200 crofters have over ten acres. If all of his land were of equal potential agricultural value, the individual with ten acres might be able
241 to attain a satisfactory standard of production. Unfortunately, not more than half of most crofts can be considered as suitable for crop cultivation. In Glendale, for example, the average size is ten to fifteen acres, but when the boggy ground and the area in drainage ditches are subtracted, it is indeed a fortunate man who can profitably cultivate more than five acres. What, then, does he do with his land?

427 Land Use. Between spring ploughing and the harvest season, the
241 best land is planted in oats, potatoes, and, in some cases, turnips. On most crofts, for every two or three acres of oats there are a half acre of potatoes, and perhaps, a quarter

[3] Arensberg, The Irish Countryman, pp. 36–38, 43.

strongly about this infringement of the traditional norms. 837
Gossip spreads very rapidly. The offenders are said to be 1.0
"no better than the tinkers." While tinkers are respected 650
because they have the power of the evil eye, they are not 764
accorded any more prestige than we would give a beggar. All who have any contact with the neighborhood or the village where the deviants live soon know all the details. Since 369
most of the adulterers on Skye have been in Portree, it adds another brick to the wall which separates the rural neighborhoods and the trade-center village. The offenders normally leave Skye as quickly as possible.

The Sgiathanach cannot be said to have a strong sense 423
of property, or, more correctly, the land is valued as a 421
place of residence and identity not as something to be bought and sold. We have seen that he uses his land communally and that he often will not leave a will for the house, not to mention his land. Even though the state thinks otherwise, he looks upon the natural resources of the island as his for the taking. At the same time, he normally respects the fruits of 421
his neighbor's labor. Any one can cut peat on the moor, but 319
no one, except an unthinking tourist, would take a piece of turf once it had been cut. In a similar way, the children are 267
generally well behaved. In the village there is a bit of stone throwing, a little profanity, and uncommonly some drinking on the sly, but rarely do children show any disrespect for the rights of others. One contractor, a Lowlander who came up to Skye to make alterations on the school, was amazed. Skye

422

422 PROPERTY IN MOVABLES--culturally defined categories of movables (e.g., food stores, personal clothing and ornaments, artifacts, domestic animals, ceremonial objects); recognized types of title or tenure; rights, privileges, and powers involved in each; relation of types of title to categories of movables; recognized types of ownership (e.g., individual, collective, corporate); legal and statistical distribution of types of ownership according to categories of movables, types of title, and classes of persons; records of ownership (e.g., property marks, registration); etc. See also:

Accumulation of wealth . . . . . 558 Offenses against property 885
Social classes 555

517 The cattle
233 knew their own sheilings; sometimes
815 they came back before milking time and stuck their heads
233 inside. They stood outside the sheiling at night, and that's how you can tell where a sheiling once was, even though the walls have fallen, by the rich green grass. Calves were born during the summer. A hollow was scooped
233 out in the peat, and lined with turf and moss. People
422 had as many as four or five cows. It was like Switzerland, only we didn't have the bells on the cows. There was lots
273 of milk, fresh thick cream and crowdie (clotted sour
242 milk); the old people knew how to make cheese.
234

233 "The moor was very serie at night, with the sound of
821 the birds. There were only a few hours of darkness
759 anyway, and I'm sure we didn't get much sleep, but somehow
513 we were always fresh. It was the air, the moor air is more health-giving. The air is different there. Ill people benefited from the change. Sometimes a person with TB would stay out there all summer. The air is heavy by the sea.

805 "There was no sense of time the way there is today.
233 If you got lost in the snow or fog, you followed the cows
221 home. You had all summer to take home the peats, to work
829 the croft, to harvest the corn. There wasn't a world,
778 there was only ourselves. That has changed since the war.

*159 The third sister worked in domestic service in Glasgow all her life and never married.

Calum Ban had joined the Naval Reserve before the war. "There was always a sign up in the Stornoway Labor Exchange for men to join the Naval Reserve, because the islanders were such good seamen. They were fishermen or had been in the Merchant Service." Calum was in the navy for five years during the war, and became "skunnered" of
*159 (tired of) the sea. He is very interested in sheep, and
233 knows their major earmarks or brands between here and Ness.
*422 "The earmarks identify tribes of people. The Macleods have a particular mark, like a slice at the base of the right ear; the other marks were added as the families divided and subdivided so that the relationship between them was lost. Even though you can't calculate the relationship, you know you were once part of the Macleods that put that original mark on; you can see it all in the ear marks."

Calum also raises bullocks, without keeping a cow.
*159 He buys young bulls at cattle sales, and sells them after
233 two or three years. But recently his back has given him a lot of trouble, and he has had to limit his crofting activities.

*159 Seonag and Calum Ban have four children. The eldest is in the Merchant Service, and the second son is a teacher. A daughter is studying domestic science in

342 maintained—once an important aid to the survival of half-
343 starved cattle. A slope from the dwelling-quarters down to the byre facilitates drainage: normally the length of the
[178] homestead follows the slope. The separation of house from byre took place in Harris and Uist over seventy years ago by County Council decision, but in most of Lewis, even in 1947, about 40 per cent of the homesteads were
342 of the primitive type, outwardly but little changed. This separate cottage, as in Harris, is a shapely little structure, roughly symmetrical and particularly pleasing when the walls are whitewashed below the pale-gold thatch.

342 The surviving 'black house' is a stone structure. As
343 Stevens has written, "the rock of the island is hard to
[314] work, and hard to win", and may be covered by peat.
[324] Undressed stones are collected and sometimes carried for long distances. Before dynamite came into use, a very large stone could be broken up by lighting a peat fire on it, then dashing cold water over it. By an old Gaelic custom, the bachelors of a township used to help to build the house for one of their friends who was about to marry.
[333] Lime for mortar being absent from the island, the walls are built dry. The wall is double, the space between being filled with earth. Hence it may be six feet thick
[354] at the base, though barely six feet high. Typical primitive houses lacked windows, only a little light entering through the smoke vent and through a piece of cured skin, replaced latterly by a pane of glass let into the thatch of the roof or by a deep window aperture in the wall.

342 Roof building is a difficult problem in construction,
343 on account of the scarcity of timber and the strength of
313 the winds, and explains the narrow plan. Wood was so
[182] scarce that when a house was abandoned the frame of the roof was removed, the spars being the tenant's; but in

[TEXT CONTINUED ON PAGE 82]

233 change in area, then the amount of stock allowed, per pound sterling of rent, ought to be
427 changed, too.
656
[175] This does not appear to have been done in Uig although in Stornoway parish the soum per pound was increased after rents were reduced in the late nineteenth century. More recently, the Crofters Commission, in re-stating soumings for some townships, has generally (but not invariably) applied the soum to the 1886 rent, regardless of the wording of the 1912 regulations. This may appear to have the merit of consistency and, insofar as crofters pay any attention to the Regulations, it satisfies them because the greater (1886) rent gives them a larger soum and less likelihood of being criticised or penalised for overstocking. However, it perpetuates inconsistencies which originated during the nineteenth century when the stock allowed per pound sterling rent was not reduced although total rentals were increasing as squatters' and cottars' holdings were added (see page above). Moreover, the old souming referred to the old type of highland cattle which were much smaller beasts than those kept today, and it assumed that the shieling pastures would be in full use. A further complication arises because about 1920 some townships acquired substantial enlargements but the soumings do not appear to have been adjusted. Altogether it is little wonder that the Grazing Regulations are seldom observed, for they seldom bear any close relationship to the grazing capacity of township lands. Proper observance of carefully revised Regulations, in which unlimited substitution of sheep in place of cattle was specifically forbidden, would be of considerable benefit to the crofters.

241 The inbye, or croft, land is invariably separated from the common pasture by a ring
233 fence, the gates of which are generally closed for protection of crops from May to
417 November. Progressive townships are installing grids to obviate the twin nuisances of
[178] traffic interference and straying stock. The fencing of individual crofts was rare until the 1930's and is still by no means general. The inbye land is, in many townships, the best winter grazing and its division into innumerable tiny fenced patches, whilst advantageous for cultivation, would restrict the movement of stock in search of water and shelter; in a predominantly pastoral economy complete enclosure of individual holdings is not
[184] necessarily an advantage. This problem will be discussed in Part III but, in the present context, it is relevant to point out that the small crofts of Lewis contrast strongly with the larger ones of, for example, the Uists and Tiree. Therefore, what may be advantageous in the latter may be retrograde in much of Lewis.

The lay-out of the crofts aggravates this problem. The long narrow strips of the 1850 lotting, well-suited to spade cultivation and common winter grazing, may require four or five times the length of fencing required by an equi-dimensional croft of similar area. If fenced the stock may be deprived of both water and shelter; since arable cultivation has become relatively unimportant a suitable solution to this problem might be to fence a small potato plot near the house and to put the rest of the inbye down to sown grass in three or four communal parks in which grazing could be properly controlled. A particular problem is posed by crofts which have been sub-divided. These may take the form of strips as much as half a mile long by 10 yards wide or, more commonly (and much worse), of piece-meal sharing of innumerable plots, a system known locally, but incorrectly, as 'run-rig'. This is seen at its height in Kneep (fig 22), where every croft in the township is affected. The problem does not arise in townships with large crofts, which are usually more nearly equi-dimensional. These are mostly the result of re-settlement schemes and have long been fenced, (see, for example, figure 15).

Crofter-tenants.

162 An analysis of crofter-tenants according to age, sex and occupation (table12) provides
427 several important clues as to the present unsatisfactory state of crofting. More than
463 one-third of the tenants are over 65 years of age; a further 16% are absent, some of these may also be over 65, others are younger people working away from home, a few are tenants

/facing p. 93/

241 century as an attempt to reform the previous system
427 of run-rig; but it is usually identified with the
175 definition given it by the Crofters Holdings (Scotland)
671 Act of 1886, as a form of land tenure to which many protections accrue. The Act defined crofts and crofting areas in Scotland, and assured the crofter of security of tenure, hereditary succession and fair rent. The legislature which followed on the heels of this act, which is sometimes referred to as the Magna Carta of the Highlands (Day 1918: 190), is mountainous. The flow stems from two perhaps incompatible aims: the desire to provide security for the landholder, and to enhance agricultural productivity. The difficulty of developing the land as an efficient agricultural unit has always existed in an area characterized by a wet climate, unproductive soil, and smallness of holdings in heavily populated areas, and was one of the factors that prompted agricultural reform in the 18th century.

175 B. Stratified Tenantry vs. Egalitarian Society
423
427
[614] At the time of the break-up of the clan system in the first half of the 18th century, three categories of persons held land under the Highland proprietor or "laird": tacksmen (gentlemen farmers, often relatives

175 of the landlord, with education superior to that of
423 other tenants) who held a lease or "tack"; tenants
427 who held no leases, or very short ones (when Fullarton and Baird made their report in 1838, tenants in the parish of Barvas had leases for five to twelve years, whereas tenants of the parish of Lochs held leases "at will," i.e., at the will of the landlord); and subtenants who had small parcels of land which were let to them from year to year by tacksmen or tenants in return for their labor, and who were called cottars or crofters (Walker 1812: 51), servants or scallags (Macphail 1916).

In 1718 and 1726, government commissioners visited Lewis, which had comprised part of the estate of the Earl of Seaforth. The Earl of Seaforth had sided with James VIII in the Jacobite rebellion of 1715, and was exiled from his estate. To facilitate the collection of rent, the commissioners sought to compile a list of the rents which had been paid by all the tenants. The 1726 rent roll listed 43 tenants in Shawbost who declared that "they have their present possession of the town of Shawbost for the sum of L224/16/— Scots money, 38 bolls one firlote meal, 12 stones butter and 12 mutton (Macphail 1916: 313)." The nearby village of Bragar constituted a

175 single tack, for which the tacksman, who was a relative
423 of Seaforth's Chamberlain, paid L247/10/8, 10 sheep,
427 9 stones butter, and 3 bolls of meal. The Bragar rental mentions scallags who were not listed because they were not smallholders; rather, they worked for the tacksman for a certain number of days per week, in return for which they received ground to cultivate and on which they might build a house. There were probably scallags in Shawbost as well; a section of common land near the sea, which bears the marks of old cultivation, is today called Blar na Scallag (field of the scallags).

The evidence is that, rather than being the egalitarian society portrayed by many idealistic proponents of crofting society today, the society living in the area we now know as the crofting counties was composed of fairly differentiated tenants and subtenants.
[103] Allotments of land were called penny, half-penny, and farthing lands (Walker 1812: 56; Gray 1952: 48); place names such as "Five-penny Borve" indicate this history of land tenure in Lewis. The 43 tenants in Shawbost in 1726 paid rents varying from L3/10/4 to L9/7/4 (Scots money, which was 1/12 of the English). The differences in rent gave them different shares in the arable ground and different shares in grazing rights on the common ground.

175 Thus some tenants were relatively more prosperous than
423 others. A large class of subtenants (scallags) did
427 corvée labor in return for a small amount of arable land and the right to graze a few livestock. Their land was intermixed with that of their masters in the prevailing system of run-rig. "Crofters" had economic standing similar to that of scallags, but had permanent, compact allotments (Gray 1952: 49).

C. Joint Farm vs. "Crofting Township"

[632] The 1726 rental indicates that the "town" of Shawbost was a corporate unit and thus that "crofting townships" have a long history. However, Geddes (1948) argues that the form of the 1726 rental was due to the method by which it was collected. In 1726, officials toured the island and made a list in large public hearings of the rents of those assembled, thereby attempt to make certain that no tenants were excluded from the rent roll. The major cooperative work unit seems to
[464] have been not the township but the joint farm, which
[476] contained enough men to make up a crew for ploughing and fishing.

171 In the Lothians and eastern Lowlands, the land could
175 be worked in larger units than in the Highlands, and a
241
427

175 632 241 In any case, the "town" or township was not the effective work unit, but rather was the larger neighborhood in which several joint farms existed. [233] The tenants of several joint farms grazed their stock on the surrounding moorland (i.e., on common grazing land).

D. From Run-rig to Crofting

175 233 241 311 Run-rig was an agricultural system suited to a pastoral people, who required the use of open, common pasture for grazing their livestock; the arable land was limited, and of varying quality (according to Day (1918: 12), 54% of the land in crofting counties was mountain and heath used for grazing, and only 5% was • [423] arable land). Residents worked several strips of different quality, and the strips (in drained beds of earth a few feet wide and many feet long called lazy-beds or fiannagan) were usually re-allocated every few [625] years. A "constable" acting for the landlord ensured that proper husbandry was maintained.

175 241 178 427 The joint farm, and the stratification of tenants and subtenants within the farm, disappeared as "progressive" landlords began, in the second half of the 18th century, to substitute compact holdings for the "mingle-mangle of dispersed strips (Gray 1952: 46)" 000 which characterized run-rig. Hamlets or clachans

175 241 361 178 Hamelts or clachans (small clustered settlements) were broken up, and houses were isolated on strips of land in linear, single-street villages.

114 178 Gray (1952, 1957) argues that the main factor behind the reorganization of land use in the Highlands was the progressive, individualistic, laissez-faire ideology of the 18th century. Grant (1930: 97) attributes the reorganization to the high demand for cereals which existed during the Napoleonic wars.

177 241 Highland landlords, who were very much in contact with the society of the Scottish Lowlands, were influenced by agricultural practices there. The trend to change run-rig, which had once dominated the whole of Scotland, to fixed, compact holdings began in the Lowlands.

• 423 425 829 According to the "progressive" ideology of the time, the giving of land to individual farmers in much larger pieces than they had previously held would serve to stimulate agricultural development and give rise to a class of capitalist farmers. To give land to a relatively few people, however, meant the removal of a large number of tenants who had hitherto been able to survive under the system of run-rig.

175 • 423 427 [161] Factors which led to further crowding were the development of industry and an increased demand for wool in the south, which occurred when traditional ties between laird and tenant had been loosened. The clans had been disbanded after the Jacobite rebellions of 1715 and 1745; those landlords who had not forfeited their estates received huge sums of money as compensation for the abolition of hereditary jurisdiction. They had experienced travel and the luxuries of other countries, and were not eager to remain on their estates. They accepted the huge rents offered to them by sheep farmers to the south, and turned vast amounts of land into sheep tracts. Tenants [361] were crowded together along the seashore, or lived on tiny holdings dispersed among the larger farms or on moorland, earning their living by doing wage labor.

175 423 241 178 Despite the factors which encouraged a high level of population to remain on the land, proprietors attempted to destroy the joint farm with its small, dispersed holdings and collective rights. Run-rig [656] agriculture was abolished in Argyll in 1776 (Day 1918: 180; Gray 1957: 49), and over the next 80 years it disappeared from the Highlands (cf. Gray 1952: 49-50), to be replaced by townships of compact holdings surrounded by undivided hill grazing lands.

423

AL PROPERTY--conception of the subject matter of real property (e.g., as t which produces food, as things that are fixed or immovable); culturally de- ed categories (e.g., land, trees, growing crops, buildings, water); types of d subject and not subject to property (e.g., sites with monopoly value, ste land); recognized types of title or estate (e.g., eminent domain, fee nple, life, leasehold, sufferance); rights, privileges, and powers involved each (e.g., usufruct, reversionary claims, privileges of gift and sale, wer of expropriation); recognized types of ownership (e.g., individual, llective, public); legal and statistical distribution of types of ownership cording to categories of immovables, types of title or tenure, and classes persons (e.g., exclusion of minors, of women, of slaves); general charac- ristics of the system of real property (e.g., private property, feudal tenure, llective property with periodic reallotments, communism); land reform; cords of ownership (e.g., boundary marks, deeds); registration of titles;

000 24,863 acres. The value of this boggy property, as
423 far as the landlords are concerned, is determined by
427 its fishing potential. The landlords generally reside
226 away from their property, and brave the buffeting gales
several times a year to return to fish for trout and
[463] salmon. For the rest of the year they hire river-
[685] watchers to prevent their tenants from poaching. As
[171] in Wales (Emmett 1964), the islanders continue to poach,
in part as an expression of their identity as independent countrymen, a minority group in a nation-state.

161 Lewis is the most populated area in the Outer
162 Hebrides, containing 21,934 of the 32,607 Outer Hebrideans
634 numbered in the 1961 census. It is part of the County
of Ross and Cromarty, whose headquarters are on the
632 mainland near Inverness. Lewis has four administrative
areas called civil parishes in which births, deaths
and other vital statistics are recorded. Stornoway
[197] parish is the largest, containing the town of Stornoway
on the east side of the island in which many non-Gaelic
speakers live. Of the other three parishes, the largest
[162] is Barvas which stretches along the west side of the
[197] island and contains 4,331 persons, of whom 94.6% are
Gaelic speakers. The people of Stornoway refer to someone
[186] from the west side as a <u>siarach</u> (west-sider), a term
which connotes rusticity.

Hundreds
103 of place names are known to the villagers 8
which are not marked on any map. These place names
[193] constitute part of the oral tradition of a population
which has lived in a confined geographical area for
generations.

632 In most of Lewis, village and township coincide.
621 The village of Shawbost is composed of two townships,
311 South Shawbost in which the crofts splay outward like
423 a fan from roads which curve over an uneven landscape,
[363] and North Shawbost which is composed of linear streets
(see Map C), to which the crofts are perpendicular.
Each township has its own common grazing land, and its
own grazing committee. All of South Shawbost and part
of North Shawbost belong to one private estate (which
includes other townships to the southwest), and most
of North Shawbost belongs to an estate which extends to
Barvas. Beyond the fact that non-crofters in South
Shawbost have found it easier to acquire crofting status,
little difference between the two townships appears to
be due to their belonging to different estates. As
[427] elsewhere in crofting regions, the landlords of the
[529] two estates are concerned mainly with the sporting
potential of their land.

632 The two townships are themselves divided into named
neighborhoods (cf. Vallee 1955 for a discussion of
"natural neighborhoods" in crofting areas).

175 178 241 423 Geddes (1948: 56) gives evidence that joint farms were abolished in Lewis early in the 19th century. Gray (1952: 50) says that by 1819 there was little run-rig left in Lewis. The factor's notebook for Breasclete, on the west side of the island, shows the destruction of clachans around 1850, and their replacement by linear townships.

175 423 429 632 178 In the Napier Commission's "Evidence" (1884) for the parish of Barvas, it was mentioned that the rent had been increased because of improvements made by the landlord, Sir James Matheson, between 1849 and 1852. Land had been drained and new townships created; and both old and new townships were lotted and rented in 1850 and 1851 (Napier 1884: 959). The Ordinance Survey map drawn up in 1852-53 reveals several interesting features of Shawbost: "New Shawbost" has recently been laid out; and in an area now incorporated by only a few separate crofts on "Carnan," a cluster of houses appears, perhaps the clachan in which joint tenants lived, and from which they went out to farm their various strips of land, before Matheson reorganized the land in linear strips with dispersed housing. The peat banks in the Carnan area are almost exhausted, indicating a long period of settlement in this area.

175 361 423 429 178 [314] [194]

175 423 429 178 It is ironic that the attempts by landlords to initiate agricultural reform and develop capitalist farmers led to a destruction of the differentiated tenantry on the joint farms (cf. Gray 1952: 51-56), and a proliferation of very small units, none of which was adequate to provide a reasonable subsistence. These small units became fixed as individual holdings by the 1886 Crofters Act, and the only important distinction thereafter was between smallholders with security of tenure (crofters), and non-crofters who built homes on the common grazing land but had no specified rights. Although various agencies were established after 1886 to enable holdings to be enlarged, only in the last fifteen years have such possibilities between officially developed in the form of official subletting and individual apportionments.

17 423 By the second half of the 19th century, a trend against laissez-faire was manifest in the writings of European scholars. As feudalism broke down, smallholders throughout Europe were being dispossessed of their land, which was then consolidated and enclosed.

171 In Denmark, legislation was passed as early as 1682 to prevent landlords from taking steps to increase the efficiency of their farm production by replacing the

171 three-field system with improved rotation methods involving consolidation of land. The Danish government feared that consolidation of land would have meant a reduction in taxes and fighting men.

175 423 162 The British government was faced with the same threat in the migration from the Highlands, as the Highlands had long been a source of good fighting men.

A reaction against the materialism of the industrial revolution developed in England as smallholders sold their land to large landholders to become laborers. The Taylor Report (1954: 9) reflects the value which is still placed on country life by maintaining that crofting communities "embody a free and independent way of life which in a civilisation predominantly urban and industrial in character is worth preserving for its own intrinsic quality."

[181]

175 241 423 654 The various acts protecting smallholdings were also attempts to keep labor dispersed: to diversify and improve the use of land, and thus to increase Britain's self-sufficiency in food production. Various marketing agencies and subsidies were introduced around World War II to achieve such aims. Among the many agriculturalists affected by these encouragements emanating from the central government were crofters.

175 423 427 458 731 In 19th-century Scotland, the cause of the Highland tenants and subtenants was taken up, as part of the trend of the times and because a series of famines occurring in the Highlands caught the attention of Britain. After the kelp industry was destroyed at the beginning of the 19th century, landlords maintained high rents on the assumption that the depression was only temporary, which caused tenants to deplete their capital by selling their cattle (Gray 1957: 38). A number of reports were published on the plight of Highland smallholders: Fullarton and Baird (1838), MacNeil (1851), Mackinlay (1878), and finally the Napier Commission's report of 1884 which was followed by the Crofters Holdings (Scotland) Act of 1886.

175 423 656 The 1884 Napier Commission Report tried to resolve the conflict between the rights of the individual smallholder and the maintenance of agricultural efficiency in a situation which still had communal elements of social organization, by recommending an organization much along the lines of the old joint farm. The township was defined as a farm, or part of a farm, which was occupied in common or in division by several tenants. The township, seen as an agricultural unit, was to be given various immunities and powers by which to achieve

175 423 656 stability and improvement; e.g., an executive officer, the Constable, was to be elected annually by the community, and he would oversee various improvements in the township (Napier 1884; Day 1918: 187-9).

175 423 671 However, the Crofters Act of 1886 did not make the township a unit of local government. It was more concerned with protecting the individual crofter's rights than with the creation of a self-sustaining, self-correcting economic unit. The Napier Commission had recommended the consolidation of crofts which were rented at less than L6 a year, and a policy of persuasion by which the excess population would be encouraged to emigrate or specialize as laborers, fishermen, and so on.

[654] [168]

175 423 671 178 [654] Instead, the 1886 Act provided security of tenure for a large number of crofters, as well as a fixed fair rent and compensation for improvements if the crofter chose to leave the croft. These assurances, and the creation of a variety of agencies (such as the Congested Districts Board, the Crofters Commission, and the Board of Agriculture) whose purpose was to encourage agricultural improvement by providing funds, equipment, breeding animals, seeds, advice and so on, constituted a set of incentives. These incentives combined with a number of other factors including improved transportation and the spread of

175 information via the technology of mass society to
423 affect the choices made by succeeding generations.
271 For example, young people are able to leave the island
178 and work in British cities or abroad, sending money
[464] home to sustain their aged parents who by law cannot
[457] be removed from the croft.

E. Changing Land Use

311 Darling (1955) described the previous Highland way
175 of life as a well-adapted, ecologically balanced system,
182 in which proper use of land was attempted by limiting the number of livestock, preserving a proper ratio between cattle and sheep, and regulating the flow of stock on the land throughout the year. Dikes (fences of turf or stone) and drains were communally repaired
198 and cleaned. Although continuity with the previous way
311 of life is evident today, the overall picture is one of
[182] partial use, and misuse, of natural resources. Various
[654] advisors from government organizations and colleges have been brought in to encourage effective husbandry and land use.

1. Specialization and Individuation: The change from an ecologically adapted, internally regulated community in which land was used intensively for subsistence

311 who wanted to keep his bullock on the reseeding for
233 another week because he wasn't ready to sell it; but
232 he should have known the rules. Some people want to
829 keep both cattle and sheep on at the same time, although the agricultural advisor says cattle should go on first, because sheep go for shorter grass. Other people want to put on twice as many sheep as those who have both cattle and sheep. When they stop keeping cattle, they think they're not getting a proper share of the reseedings.

"The Crofters Commission wanted communal township schemes. But people have different demands. It's better to go for an apportionment. You can do what you want with your own land."

178 The number of township members participating in
311 the communal schemes is diminishing to the point where
232 it is less expensive, and much less subject to conflict
423 arising over differences in stock-keeping, to invest in
476 individual holdings of land rather than try to sustain communal practices.

264 The only occasions on which it is customary to feed
574 someone an entire meal is at a work party, such as peat-
576 cutting. On such occasions the preparation of meals is
[461] done in an atmosphere of competition and mutual scrutiny,
[492] and the meals are often elaborate. At other times, the requirements of etiquette can be minimally fulfilled by giving foods which are still relatively abundant, but which were much more abundant when the land was cultivated
[242] and cows kept. Such foods are barley bread, oatcakes,
264 clotted sour milk, cream and fresh butter. These foods
571 are usually offered to visitors along with tea, and in the
574 past this custom served to minimize the economic disparities between villagers, to spread scarce resources. A similar
[739] function was served by the practice of giving part of
[431] each catch of fish to old widows and other villagers in need of aid. Even though food is more abundant and diverse today, the taking of tea, and especially food, during a visit is still very important.

173 A 50-year-old man who "married into" a croft recalls,
[581] "I came from a family of ten children. Everyone had to
[428] leave, or marry a girl with a croft. Only the eldest son
423 could inherit the croft." There was little room for
581 romanticism in the fight for scarce land among the sons of large crofter and non-crofter families. "The most

581 "The most
584 important thing about courting was the land. If a girl
423 was going to get a croft, she could have the pick of anyone." Stories are told of broken alliances and the interference of parents, all related to the inheritance of the croft. For example, the father of a 70-year-old woman living today deserted the beautiful girl to whom he was engaged to marry a girl with a croft. "Never mind beauty, just a bit of land." A man would hike fourteen miles across the moor into town to bring back the jug of beer required for the reiteach (the dinner party announcing an intended marriage), only to find that the girl was having a reiteach with someone else.

233 Cattle were much more important than sheep in the early economic history of the Highlands. Scottish history is full of stories of cattle thieves, and of "the drove,"
[189] in which large herds were driven to Lowland markets. The most common examples of witchcraft concerned spells cast on cows. Many Lewismen still remember market days on Lewis, the day of the drove when cattle were herded into Stornoway from all parts of the island; when children were taken from school to help with the drive, and shopkeepers put up extra stalls for the occasion.

Until as recently as ten years ago, a form of transhumance was practiced on Lewis whereby the cattle

592 unmarried sibling. Eleven households consist only of siblings who have never married, men and women who in 1971 were 45 years old or older. Two widows live with
[539] their unmarried siblings. Sixteen widows or widowers live alone, and sixteen unmarried persons live alone.

241 The large number of households occupied by single,
592 elderly people reflects the use of the croft as a place
423 of residence rather than as an agricultural unit, a
671 view of the croft that was given legal expression in
828 1968 by the Miscellaneous Provisions Act. Before 1968,
[428] the croft went automatically to the eldest son if a crofter died intestate. Since 1968, the rights of different claimants must be considered and tenancy by a new person must be confirmed. District and county councillors argued for this change, saying that a widow was often left on the croft and her security endangered because the eldest son was usually far away from the island, in Canada or some other country. In other words, rather than an agricultural unit which should naturally be taken over and worked by the male head of the household, the croft is seen as a place of residence for the infirm and for the aged, and especially for the aged female.

657 The Crofters Commission has suggested that elderly
185 people be allowed to rent small plots of land

657 their houses are located, and that most of the land
185
423 freed for use by more active crofters, but the ideo
888 associated with possession of the croft makes such
311 plan extremely difficult to implement. "The croft
your base, the only thing you have. You don't want
taken away, even if someone else is using it alread
anyway. Our county councillor suggested amalgamati
the unused crofts at a recent meeting. No one said
anything, but no one wants it."

592 Of the five households that have the use of th
241 crofts each, one consists of a bachelor who uses the
311 crofts for grazing a large number of sheep. A secon
household is composed of two brothers who had stayed
at home to take care of their aged parents. One of
these brothers recently married, after the last pare
died. These men keep cattle and sheep, and both wea

592 A third household is headed by a married man wh
241 has recently sold most of his livestock in order to
311 "concentrate on the weaving." His father, who used
288 haul peat with a horse and cart in exchange for the
use of grazing land so that his family never had to
go to the sheilings, died a few years ago. "My fath
was a crofter only. The weaving didn't start until
the 30's. He was wounded in the war. He got a pens
and sold a cow or a few sheep each year. But I didn

like to leave the loom for the time it took to look after the sheep."

A fourth household consists of three unmarried siblings in their 40's and 50's who recently sold their cattle and now keep only sheep for their own consumption. They cultivate a small amount of oats and hay to feed the sheep during the winter. The twelve acres are largely responsible for taking care of the livestock is now "concentrating on the loom," and his brother works in the mill. Their sister, who used to work in hotels on the mainland, now keeps house for them. Described as an "half-continental family," they have a tractor and a deep-freeze and take care of their peat and the harvesting of crops by themselves. One of their crofts has become too waterlogged even for grazing and was sold recently to the state at a local auction, note for recent purchase has as a prerequisite for applying to the Department of Agriculture for a housing grant. Only tenants of crofts can apply for such grants. As this particular croft is too wet to be cultivated or used as a house site, the only motive which the new tenant has to become a crofter is to gain access to governmental subsidy.

The fifth household is composed of a retired couple and their son and his wife and family. They have no cattle, and use the crofts for grazing sheep.

83

sheep were let out of the pens, and a fight broke out between the two groups of people.

3. Crofters vs. Non-crofters. Another division within the township has developed largely because of the attention paid by outside agencies to "proofing." The Crofters Act of 1886 defined crofters and gave them a protected, privileged status. In fact, very little distinction existed between non-crofters (sometimes called squatters and/or landless tenants) and crofters, and in some places, such as the Isle of Scalpay, non-crofters even out-numbered crofters. Both categories were linked to each other by bonds of kinship and mutual dependence. Non-crofters were in fact favored economically. They did not have to pay "rent," but had the same opportunity to cut peat and plough land as did crofters. Many crofters themselves had bonds, units of land not recognized as part of the croft and not included in the land for which rent was paid but recognized as property by the villagers themselves to the extent that their title of moorland passed down through families or could be given by one person to another. Even today, a young girl thinking of getting married says her future husband might build their house on her father's bonds, and he may make a gift or purchase an moorland "grant" to him by his wife's aunt. Officially, a non-crofter had no "rights" to a house which he built on the common

84

land, and land he could not transfer much property in it at will. Similarly a crofter had no right to his bonds, and could not formally protest if another crofter sought to appropriate this land for his own use (see Chapter 2 for a discussion of apportionments). But in both situations, informal understandings superseded legal rights.

Various legislative acts which followed the 1886 act focussed attention on the crofter. Various matters associated with crofting are handled by a Crofters Commission. Crofters have access to grants and loans to improve land and build houses and homes. They may buy goods at low prices in a nearby cooperative store. As crofts were fenced, land around the township became scarce and non-crofters found it difficult to keep large numbers of cattle and sheep.

Within the crofting system, it became possible for non-crofters to gain title to the small plots of land on which their houses are built. Some loans are available to them for building houses. Non-crofters have access to the various subsidies available to all agricultural-crofts, such as the subsidies for raising hill sheep and beef cattle. There is still the feeling, however, that crofters have rights which non-crofters do not have and that in conflicts over scarce goods crofters have

85

the edge over non-crofters. "Squatters can do what they like, can peat, can put a cattle on one common grazing, but this is a privilege, not a right."

The clerk of a grazings committee says, "When it comes to an argument between a crofter and a squatter, the crofter always wins. A squatter has rights only with the grazing committee's permission. If one crofter disagrees, the squatter is out."

A squatter muses bitterly, "I wanted crofting status because I wanted to get a Department of Agriculture repair to build a house. I work on the peat road; I go to all the funds. But at a township meeting, they didn't want me to get crofting status. They were afraid I would start grabbing peat banks or opportunoness in the common grazing or something. There's your brotherly love for you."

4. Subsidies: In the section entitled "Changing Land Use" I suggested that the availability of subsidies has encouraged a more specialized investment in agricultural activities.

The villagers are keenly aware of outside institutions which give money. They speak to each other about forms which they receive from the Department of Agriculture and the Crofters Commission, in much the same way as they are curious about the number of tweeds which another

86

147 his family must maintain the payments. Many persons who have settled in cities on the British mainland or abroad are not concerned with retaining membership in the association, but members of their family who remain within the village usually continue to pay their dues for them. Even if in death, the "exiles" eventually return to home and community.

Families buy cemetery plots for as many as six to eight persons. The deceased is buried in an area designated as belonging to his family. He is not buried alone but beside his parents and their unmarried siblings if he is unmarried, or with his spouse. "I wouldn't like the idea of being cremated. I want to be buried with my family." Even though a woman is buried beside her husband, her maiden name is placed on the coffin. Often neighbors have plots near each other.

A special part of the cemetery is reserved for strangers. A "man from out" remains an outsider, even in death.

HISTORY

241 documented; and Harris and Lewis played out their part in the
242 drama of a uniform size, often fit to provide only a bare sub-
243 sistence living. This is still so today. There were and are no means
244 of achieving satisfactory standards of living, of cultural promotion, no
245 ladder to climb to prove one's ability to win the land (cost to the
246 crofter's income in yield. And as each family moved upward, the a
247 progeny demanded land. The family acres were divided, sub-
248 divided and fragmented in a vicious mathematical system; more
249 people, less land.

In the nineteenth century, large estates were sold. The new-
250 owners, with no kinship ties with the small tenantry, saw that
251 the only way to make their estate economic was to establish
252 large farms, which meant the eviction, by force if necessary, of
253 the small tenants. This is what happened. For those who did not
254 emigrate, it was a life of hardship and a wide gap between the
255 small could barely stand, and thinking of the prospect of starva-
256 tion and the 'old days'. Resentment was researched on those old days
257 became the root of action; and a fierce agitation for land reform
258 started. The Minutes of Evidence of the Crofters' Commission
259 (1884) of the Deer Forest Commission (1894-5) and the several
260 official reports on the conditions of the crofters and cottars give
261 ample evidence of bitterness and despair at the result of poverty
262 and lack of opportunity. About 1870, unrest in the congested
263 areas of crofting township involved a political issue. The flames of
264 ideals were burning high and bright. Ideals were transformed into
265 action: take the land!

By 1880, the ripples from the stone flung into the agrarian
pond were reaching the general public. Sides were taken: one
stood either on the economic side in high feelings and a deep sense of
red line of sentiment based on high feelings and a deep sense of
wrongs being perpetrated on fellow humans. The landowners
naturally insisted on the right to move/onto an era of land use in
which management was not hampered by affairs of sentiment or
philanthropy. Governed by the cold principles of business, they
hardened themselves in the face of their attackers. And though
they pointed so arrears in rent, and their inability to improve
their land agriculturally while they had tenants not of their own
choosing, they faced mounting antagonism.

119 tion and the 'old days'. Resentment was researched on those old days
120 became the root of action; and a fierce agitation for land reform
121 started. The Minutes of Evidence of the Crofters' Commission
122 (1884) of the Deer Forest Commission (1894-5) and the several
123 official reports on the conditions of the crofters and cottars give
124 ample evidence of bitterness and despair at the result of poverty
125 and lack of opportunity. About 1870, unrest in the congested
126 areas of crofting township involved a political issue The flames of
127 ideals were burning high and bright. Ideals were transformed into
128 action: take the land!

By 1880, the ripples from the stone flung into the agrarian
129 pond were reaching the general public. Sides were taken: one
130 stood either on the economic side in high feelings and a deep sense of
131 red line of sentiment based on high feelings and a deep sense of
132 wrongs being perpetrated on fellow humans. The landowners
133 naturally insisted on the right to move/onto an era of land use in
134 which management was not hampered by affairs of sentiment or
135 philanthropy. Governed by the cold principles of business, they
136 hardened themselves in the face of their attackers. And though
137 they pointed so arrears in rent, and their inability to improve
138 their land agriculturally while they had tenants not of their own
139 choosing, they faced mounting antagonism.

HISTORY

140 was made in the Crofters (Scotland) Bill of 1961; this had a mixed
141 reception. In general, today, small crofts predominate in most
142 areas. Out of some 18,000 crofts, the number is decreasing from
143 about 15 per cent record 20 acres (see Chapter 5). But size has
144 little to do with the quality of the land, whether arable or rough grazing.
145 In fact, the proportion indicates that some 85 per cent of all crofts
146 in Scotland, and this applies to Harris and Lewis, cannot be con-
147 sidered at full-time now or as potentially full-time.

EDUCATION

148 In general, the Highlands and Islands of Scotland owe their intro-
149 duction to letters to the early Christian missionaries. One of the
150 Commissioners of the Highlands and Islands (1884) in Western
151 Scotland was for the cultivation of learning and the training of its
152 numbers in sacred and profane literature. Associated as they were
153 so closely with the common folk on the one hand and the aristo-
154 cracy on the other, the aspirations of this learning and desire for learn-
155 ing clubbed off to advantage on to willing recipients. Literacy
156 however, has had many ups and downs since the dawning of the
157 Christian era in the Hebrides. Though it is impossible to ascertain
158 to what extent the common folk participated in the knowledge
159 imparted by the early Celtic monasteries, there are many
160 references to a class of cleric called 'scolocs', whose learning was
161 confined to the service of the monastery and the cultivation of the
162 'scoloc' is still retained. Certain clerics as 'gealag', a farm servant,
163 the poor scoloc and others. Knowledge was restricted; education was
164 monasteries in return for service as labourer on the church lands,
165 and who appear in monastic records as late as the fourteenth
166 century.

As late as the sixteenth century, however, after the influence of
167 the Church had diminished, the inhabitants were almost whole
168 illiterate. When the Fife Adventurers came to Lewis in 1598, they
169 brought a schoolmaster with them; though it can be taken that
170 his services were intended for the improvement of the incomes
171 of the Fife Adventurers, it is likely that he was also the tutor of
172 the MacLeods of Lewis at the time of the Fifers' arrival, was un-
173 able to sign his name. Two of his sons, on the other hand, were

175 reception. In general, today, small crofts predominate in most
176 areas. Out of some 18,000 crofts, the number is decreasing from
177 about 15 per cent record 20 acres (see Chapter 5). But size has
178 little to do with the quality of the land, whether arable or rough grazing.
179 In fact, the proportion indicates that some 85 per cent of all crofts
180 in Scotland, and this applies to Harris and Lewis, cannot be con-
181 sidered at full-time now or as potentially full-time.

EDUCATION

182 In general, the Highlands and Islands of Scotland owe their intro-
183 duction to letters to the early Christian missionaries. One of the
184 Commissioners of the Highlands and Islands (1884) in Western
185 Scotland was for the cultivation of learning and the training of its
186 numbers in sacred and profane literature. Associated as they were
187 so closely with the common folk on the one hand and the aristo-
188 cracy on the other, the aspirations of this learning and desire for learn-
189 ing clubbed off to advantage on to willing recipients. Literacy
190 however, has had many ups and downs since the dawning of the
191 Christian era in the Hebrides. Though it is impossible to ascertain
192 to what extent the common folk participated in the knowledge
193 imparted by the early Celtic monasteries, there are many
194 references to a class of cleric called 'scolocs', whose learning was
195 confined to the service of the monastery and the cultivation of the
196 'scoloc' is still retained. Certain clerics as 'gealag', a farm servant,
197 the poor scoloc and others. Knowledge was restricted; education was
198 monasteries in return for service as labourer on the church lands,
199 and who appear in monastic records as late as the fourteenth
200 century.

As late as the sixteenth century, however, after the influence of
201 the Church had diminished, the inhabitants were almost whole
202 illiterate. When the Fife Adventurers came to Lewis in 1598, they
203 brought a schoolmaster with them; though it can be taken that
204 his services were intended for the improvement of the incomes
205 of the Fife Adventurers, it is likely that he was also the tutor of
206 the MacLeods of Lewis at the time of the Fifers' arrival, was un-
207 able to sign his name. Two of his sons, on the other hand, were

HISTORY

208 The crofters were in a state of revolt against the accumulation
209 of trends and events which now stood like a high dam against their
210 aspirations to a large level of prosperity. Crofters had been
211 forced in open conflict with local and national authority. Unhappy
212 scenes were enacted, many being in complete variance with the
213 natural temperament of the Highlander. Lewis crofters were not
214 far behind with their contribution to the agitation for land reform,
215 though they had perhaps suffered less direct action from land-
216 owners than had crofters in the Highlands and southern Islands.
217 But their living conditions had deteriorated. And an inhumanity-
218 efficiency factor made for deep unrest.

Land agitation was prominent in Lewis in 1881, and large numbers of
219 Lewis crofters gave evidence before the Napier Commission. This
220 Commission was set up to inquire into the condition of crofting
221 conditions in the Highlands. In setting up relieved a situation
222 of acute tension, though it neither extinguished the political agitation
223 nor mitigated the dissatisfaction felt in the more distant districts.
Under Lord Napier's direction a mass of information was col-
224 lected. The Commission's recommendations, though of a certain amount
225 of political declarations in the country, but did not also
226 provide concrete relief to the crofters. The Congested Districts Board
227 was established, which more than it did. It scraped away
228 only a little of the vast problem. The next major landmark in the
229 history of land reform was the passing of the Landholders (Scotland)
230 Act of 1911. It extended certain provisions introduced be-
231 the crofter in 1886, and further provisions for a class of tenants who
232 benefited by bringing in the tenants of holdings rented at not more
233 than £30 (£30 in Lewis or not exceeding 50 acres (30 acres in
234 Lewis. The 1911 Act also brought into existence the Scottish
235 Land Court in place of the Crofters Commission. In Lewis, how-
236 ever, the hunger for more land went on unabated and reached a
237 not insignificant peak during the later years of Lord Leverhulme's
238 regime.

A new Crofters Commission was set up in 1955, following on
239 the report of a Commission of Enquiry under the chairmanship
240 of the then Principal T. M. Taylor of Aberdeen University. Fresh
241 provision for the reorganization, development and improvement of
242 the crofting system in the seven crofting counties of Scotland

LAND USE AND CROFTING

1901, the average was only 5·066, the county average being 5·988.
The population was still to reach its peak in Lewis, some 30,000
in 1911. Emigration was at a fairly high rate, some 1,000 per
decade, but the population was still, whether arable or rough grazing,
9,000 during the same period. In 1894 it was estimated that the
number of cottars (or squatters as distinct from crofters was in
the region of 1,000. These people, mostly relatives of crofters, con-
stituted a serious problem in crofting townships.

Elsewhere in the Highlands, the enlargement of crofting holds
was relieved by emigration to Canada and America. It was not possible for
the same to be done in Lewis, and Harris possessed even less
useful land to share out. Many applications were made by crofters
either for an increase in their own holdings or an increase in the
acreage of common grazings held by each township. Though
some 300 acres were handed over to crofters, the demand was
not for crofting purposes, there was a steady refusal to diminish
the acreage of land in the common grazings.

The Congested District Board was appointed in 1897, super-
vising public works in crofting areas, and providing a certain amount of
their life. It carried on until 1912, when it passed into the new
Board of Agriculture. The Congested District Board
was established to improve the requirements of the crofters and their
spokesmen. The resultant Crofters' Act of 1886 fixed the crofting
tenure into that right tenure in which agricultural innovation,
opportunity for improvement, the social progress of crofting com-
munities are largely dependent

AGRICULTURE AND FISHING

THE CROFTER

The pursuit of agricultural processes, their growth, development and improvement, to establish a foundation for a secure society has never been easy on the island. The unyielding nature of the Lanar rock, Archaean gneiss, its hardness, its non-porous property, have all contributed to the resultant pattern and character of society which emerged. Though one is tempted to define crofting as an agricultural activity, it is also something much more intangible: a way of life. To quote the Napier Report on *The condition of the crofters and cottars in the Highland and Islands of Scotland* (1884): 'Habit and local affection bear so great a sway in the minds of crofters that Highlanders will be found to who prefer rather be proprietors in the mountains of Skye, or the wastes of Lewis, than on the fertile plains of Manitoba.' There is the Island of Lewis, with poor, peaty soil covering the Archaean gneiss, but with a crowded, lively, vivid community,' said the Taylor commission in 1953 (Commission of Inquiry into Crofting Holdings).

The Highland crofter is the subject of an extensive literature. A special authority, the Crofters Commission, exists solely for the purpose of caring for his needs. He has special rights and privileges which are safeguarded by the Land Court. Crofters' unions have formed themselves into a strong federated wall for the system's defence.

Socially, the term 'crofter' means, on the island at any rate, a landholder who cultivates his own (arable) holding, his croft. He shares the common pastures with his fellow-crofters, each of whom has a right to carry a sum of so much stock, the 'souming'. These common pastures or grazings are a social link of some considerable significance, forming the basis for the crofting township, as distinct from the communities set up under the influence of some agricultural land use such as hamlet or village, where there are both small-holders and true farms, and the only communal land is the village green or common. For instance, outside the crofting counties area the main unit of Scots life in the country is the farm, with its tied cottages. Then come the full-time small-holdings important in the north-east and the southern Highlands.

LORD LEVERHULME'S FISHERIES

When he pulled out of Lewis to go south to Harris, he offered—such was the character of the man—as thanks for the '98 per cent support' he got from the people of Lewis, to each Lewis crofter, on a free gift, and the Lewis people, together with all his property in Stornoway, to the people of the town.

In 1919, Leverhulme became proprietor of Harris, and concentrated his efforts in Obbe, now called Leverburgh, in South Harris. The harbour at Obbe lacked the natural advantage which Stornoway had, so he spent large sums on making it navigable. Rocky obstacles were blasted away; numerous buoys and beacons were set up to guide vessels into harbour; new quays were built, and kippering sheds, and other buildings necessary for packing and curing herring were erected. Among his other undertakings in Harris were the provision of a mill for making tweeds, and he bore half the cost of the 54 miles of road between Leverburgh and Finsbay. In 1925, after a visit to the Congo, he died in Brussels. His Harris schemes came to an abrupt end. And the remains of his fishery harbour are still to be seen in the quietness of the little township named after one of the most stormy of business periods that Britain has ever seen.

Tourism

Tourism has always been a preliminary and casual affair, until the introduction of the fast ferries which now link the mainland to Skye with the Lewis and Harris. Some 10,000 cars come yearly from Skye to the Hebrides. In 1913, the Stornoway Tourist Association had a struggle to increase the number of visitors to the town, to establish it as a tourist resort. It is much the same today with the Western Isles Tourist Association, which is having difficulty in integrating tourist facilities with crofting activities. In Lewis, the Stornoway Trust has assisted in establishing pony-trekking, a venture which has the potential to mirror the success of a similar one in the Isle of Skye.

PRESENT INDUSTRY

Almost an echo of the kelp-burning industry is the alginate industry. It provides employment for only small numbers, but as a

A HARRIS VIGNETTE

Lands were not allowed to become waste; in 1710, a Roderick Campbell in North Uist was paid to come north and settle in the 1095 island of Pabbay, off the east coast of Harris.

It is significant that much of MacLeod's rents was paid in money rather than produce, for it emphasises the great value of the cattle trade in the Highlands, in which Harris, though not a significant part—that is, compared with neighbouring Lewis. It was sound economy for the Highlander, and far in advance of the theories of the so-called 'improvers' of a later age. The rents of the MacLeod estates were collected by chamberlains, and part of the work of Malcolm Campbell, the chamberlain for Harris and other holdings, in the eighteenth century, was the ferrying of Harris and other herring were erected. Among his other undertakings in Harris were the provision of a mill for making tweeds, and he bore half the cost of the 54 miles of road between Leverburgh and Finsbay. In 1925, after a visit to the Congo, he died in Brussels. His Harris schemes came to an abrupt end. And the remains of his fishery harbour are still to be seen in the quietness of the little township named after one of the most stormy of business periods that Britain has ever seen.

A HARRIS VIGNETTE

Other tombs inside the church include that of Mary MacLeod, a 1705 a baroness of the seventeenth century who was also governess to the young Prince Charles Edward Stuart. She was probably the first composer what may be called the 'court' song, in simple words and in the 'strophic' verse-form of rhythm and assonance enjoyed by all Gaels since her time. Her last elegy was composed for Sir Norman MacLeod of Berneray in 1705.

So far as personal characteristics are concerned, there is a marked difference between the Herrach (Harriman) and the Leodhasach (Lewisman). Their Gaelic dialects are different, the Harris pronunciation being more lazy, with an added lilt in singing lilt. And Harris Gaelic has fewer words of Norse origin. The main reason for this difference has been a migration from Lewis: before a road was cut, the mountain barrier of north Harris divided the inhabitants of the two parts of the same island, who developed in their own distinctive ways.

The character of the land of Harris has also had much to do 1715 with the difference. Harris for the most part is fertile, with lots of 1653 expanses of rock outcrops. The east side of the island is torn in shreds by fiord-like sea-mouths; the west coast is slow-moving with large expanses of sand and machar-land which look out over the Atlantic breakers rolling in from a sea that is oceanic in appearance and in fact. From early times the Harris folk have had to work hard to scarify their snippets of land to make it fertile. Regular increases in population forced them to cultivate land 1745 extending up to 500 feet above sea level in some places, in the 2342 form of hard-won lazy-beds. After the clearances early last century, when the more fertile lands on the west coast were taken over for the formation of sheep farms, the people concentrated on the eastern side of the island, and on some of the higher ground in the west.

On Lord Leverhulme's death in 1925 the ownership of large 1923 tracts of Harris passed to absentee landlords. After this, some of 1959 the lands which had been cleared a century earlier were purchased by the Government and broken up into crofting units, enabling some of the indigenous population to come back to make 1923 use of the more fertile lands of the west. There are some 550 2241 crofts in Harris, with 29 regulated common grazings; the total

1923 acreage of regulated common grazings amounts to 65,000 acres. 2241 The working units (as distinct from crofts) in Harris are classified according to the available acreage: the majority have 50 acres arable land. Less than 250 acres of land have been improved.

The age structure of the Harris population in 1951 and 1961, showing the decline in numbers and rise in age

1951 There are four districts in Harris: North Harris, with its islands, the Boes of Harris on the east coast, the Leverburgh area, with the islands of the Sound of Harris; and the west coast. 1953 North Harris is mountainous country, dominated by the Clisham

From prehistory to the present day, these geographic zones have played their parts as factors in evolution, although the bulk of the population has lived in the marginal areas, and have been modified by economic and social phase. At times the Hebrides have been more closely linked to Ulster or to Norway than to Edinburgh or London. In viewing these zones, we shall not find simultaneity in historic events, but comparability in stage and transition, even an alternating pattern. From the evolutionary point of view, the revealing character of Island life lies not only in static survivals, in what Sir Arthur Mitchell found in the Islands and described as 'the fossil Celt', but in the dynamic. Island life is characterised still more by the dynamic strength of its continuity—notably of early or primitive institutions, and by the late occurrence of changes when, at last, they came.

The social consequences of these regional differences in evolution are profound. The 'Plain'; the south-east of the Seven-Tees line, large village communities with 'common fields' prevailed, forming the later manor in England; in the north and west, the Celtic fringe lands encouraged the continuance of hamlets. These hamlets housed close-knit groups of families, often of no more than four or five to a dozen relations by blood—in Scots even today (much as in Gaelic) the word 'friend' frequently implies kinship. Each small group formed a team. Together the men ploughed their small rigs (or ridges) and herded their stock in common, and on the coast they rowed their boat as its crew. The women, too, did much together, as when they spun their yarn, and fulled or 'waulked' the cloth that one of them had woven, helping by turn in childbirth and child-care. Usually several of these teams were linked in a larger

pastoral group, the germ (in the Hebrides) of the present township with its common grazing. Hamlets and township formed circles of cultural and religious life in common. These 'social' or 'asiatic hamlets', or 'little communities', as they were called by understanding writers on the Highlands, lived on in the Hebrides almost until a century ago. Features of their form and life have long been known, but their life has not yet been envisaged in its full dynamic significance.

Hamlets, unnoticeably, informally grouped in these small hamlets, have been mistakenly described as solitary or 'dispersed' by scholars accustomed to larger and more 'organised' groups. The mistake was made in Ireland of the nineteenth century, such as Meitzen with reference to the hamlets of Brittany. Similarly, because of the small number of crofters, a typical group may be, but fact of town-work and joint holding has frequently been overlooked; yet a fundamental mistake is made when such close-knit team-work and joint tenure are described as 'individualistic'. Moreover, these teams were linked together in larger, more loosely bound pastoral communities of township and district. In Scotland and elsewhere, it is true, such hamlets came historically to be split up in various ways, into smaller farms and scattered cottages. The larger link of common life was also superseded by the proprietor's estate. Indeed, the twofold revolution involved caused a fundamental regional cleavage within 'the North and West'.

Partly as a result of their small size, the tenure of farm-hamlets was frequently informal. In northern England, the hamlet and their lands were not entered in Domesday Book; still less are early entries complete in Scotland. For this and other reasons, jurist and historian may fail

184 Comparisons at the present day are most illuminating.
[791] In the Hebrides one may pass from Calvinist Lewis-and-Harris to Catholic Barra, through South Uist, where Presbyterian and Roman Catholic dwell, side by side, in mutual respect. Although their home life, economy and language are the same, the influence of a comparatively
[121] recent divergence in religion is marked. Such Island evidence, present and past, forces one to re-examine conclusions upon life in the Lowlands accepted until recently, and to seek for the truth upon earlier forms of life in common and for their meaning today throughout 'the North and West'.

175 Ancient elements of unity, and later ways in which
423 these were broken, adapted or remade, region by region, are being unravelled. The Old Estate Plans, made at the
427 outset of the agricultural revolution, show these immedi-
621 ately before the re-planning of fields and farms (*circa* 1750–90). These plans also reveal the existence of still
178 earlier types, not otherwise recognisable even on the spot.
[184] With their rentals (when available) they reveal the ways in which old joint farms were placed under a single tenant, as in Lothian, or were split up among several tenants, as in Ayrshire.[1] From such geographical data, both the economic and the deeper social aspects of rural life emerge with new clarity. Such data may be linked to Planning Surveys of land and rural life for tomorrow.

621 Now, although so fundamentally equalitarian within
427 themselves, these hamlet communities of the Gael were subjected to the overlordship of a chief or laird, either directly or through an intermediate gentleman-tenant, a
[174] 'tacksman'. History, with archaeology read in history's

183
181 democratic reorganisation, with loyalty to one's fellows
185 to a leader.

Here again, Lewis-and-Harris may have something
178 teach, as one of the last communities in Britain in wh
185 much of ancient common right over land and sea has b upheld. Trust ownership of Stornoway estate has streng
[174] ened the possibilities of rural planning there, while
[423] fisheries are a public resource which are partially prote for local fishermen inshore and farther out are closed none. The useful Lewis Association has published mo of local survey for social and economic planning. A time when democracy is struggling to see its way tow economic and social freedom, such communal initiat have more than local significance.

121 This sketch of comparisons and questions in rural
131 raised by Hebridean evidence, through a wide and va region of the British Isles, must serve to indicate the
182 graphic setting of the Island and relate the historic contemporary problems of its own community to w fields. This book is not directly concerned with the u and industrial problems of the firth-sides and 'incl plains' within the varied land of 'the North and W of Britain, deeply though they affect the hard-hit fishe of the Isles and the Island migrants— seamen or labou tradesmen or factory workers, nurses, teachers or cl
121 Even for the migrants' sake, it is vital to maintain
185 economic balance, and restore the cultural and spi life within each industrial region, in order to mai that of Britain as a whole. It was not enough to sch 'the murdered towns' of Tyneside, Wales, Lanca or Clydeside as 'Distressed', 'Special or Develop Areas'. The balance of Britain as a whole mus restored.

Let us begin with the economic and the social significance of the Highlands and Isles with which we are concerned. Economically the crofters' 'living space' is the narrow interrupted belt of improved land (shown black) which is generally fronted by the sea and its inshore waters, and is backed by the Crofters' Grazings (enclosed by line C on the map). Some 700 crofting townships or communities are found in Zetland, the North-west mainland and the Western Isles, each with its Common Grazing; the line C also encloses a small area devoted to other grazings. Deer forests predominate on the eastern, mainland, side of the line. On the remainder of the hill country are to be found the hill-sheep farms, with other small farms and small-holdings.

In the past the fishing crew at sea and the joint labour-team on land formed the communal units contained within

Key to use of Land and Sea
(Highland, Island and Urban Areas)

1. The dotted line C .... C encloses the Crofters' Grazings, mainly 'Commons'.
2. Black areas: strips of 'Isolated Arable' within the rough pastures of the Highlands and Southern Uplands (left blank).
3. Horizontal ruling: open sea, outside the 'three-mile' belt of 'inshore fishing' (left blank).
4. Vertical ruling: urban and industrial regions.

Key to Size of Labour-Teams of Farms and Small-Holdings
(in the Lowlands)

The symbols show the average number of employees per team in each county.

(1 symbol = 100 teams)

(a) Per Mixed and Dairy Farm
— 2·2 to 3·8 (3·1)
◆ 4·1 to 5·6 (4·9)
■ 6·4 to 8·2 (7·1)

(b) Per Full-time Small Holding
• 0·7 to 1·0 (0·85)

(The numbers in brackets are the averages for Scotland.)

the township; and to each were allotted the rights of the common grazing and the fishing grounds. For more than a century the croft has been held individually, though in the townships the common grazing is still held in common. Beyond these 'homely' limits lie wider horizons, in the past those of seafaring and of droving or the chase, and today of fishing and gillieing at home, or of ocean journeys, urban occupations or colonisation.

In the Lowland regions each symbol represents 100 holdings. For (A), 'mixed and dairy farming', the particular type of symbol shows the average number of workers employed on a farm-holding in each county. On each farm the employed workers form what may be called the 'Labour-Team'. A team may be 'small', 'medium' or 'large'. The Scottish averages of these three types (indicated in the inset key to the map) are roughly three, five and seven workers per team. Four 'casual' workers are counted as equivalent to one 'permanent' worker, but farmers' wives are excluded. Under (B), for the same Lowland counties and areas, full-time small-holdings are shown separately. The Scottish average of less than one full-time worker employed, most often a son or daughter of the small-holder, is typical of all the counties.

As to the relative importance of the different classes of farms and small-holdings in Scotland, true agricultural land-holders number 68,000, of which fully one-third hold part-time holdings (like the Island crofters), one-third 'full-time farms', and rather fewer (one-fifth) hold 'full-time small-holdings'. The remainder accounts for other types of less importance. The farms predominate in terms of improved land, full-time employment, and of course of production. As to area, farms cover 80 per cent of agricultural land. The farmers employ nearly 90,000 workers,

103 234 175 491 Harris; South Harris is ringed by a road, extended recently to take in the more isolated 'Bays' townships.

2. *The Crofts and Crofting Ways*

241 The prevailing modern unit of cultivation and tenure in the Islands is the croft, the land held individually by each small landholder or 'crofter'. The Anglo-Scottish term croft (Gaelicised as *croit*) meant steadily cropped, infield land, manured and never left fallow, and distinguished from the unmanured outfield with its long fallows
[175] and poor out-turn. This term came into common use in the Highlands and Isles in the eighteenth and nineteenth
[427] centuries with the splitting up of the older unit of cultivation and tenure, the small joint farm, with its little team of
[423] fellow-workers or 'small tenants'. By 1830 group tenure had been replaced by individual holding of crofts, but with the pasture still held in common, as it is to the present day, and an allotted strip of the machar.

The Lewis croft consists of a nominal five acres of crops, of oats, barley (or bere) and potatoes, sometimes with recent additions of turnips, and more often a small
[175] hay crop. The word 'nominal' is used because during the nineteenth century the croft had often been subdivided
[428] between two or more sons, without addition by reclamation to bring each subdivision up to the acreage of the original croft. Moreover, in the hilly southern part of the Island, cultivation is in little patches instead of in continuous fields. There, narrow ditches have been dug and the soil heaped up to form little ridges about ten feet by four, banked up
[178] by turf. These are known as *feannagan* in Gaelic, or in English, 'lazy-beds'—a term in use as early as the time of Burt, two hundred years ago. Thus only about two-

342 adequate air-space, and windows opening at the top and
746 usually kept open by day, in which a woman can work at
178 ease. The Department of Agriculture aided the building of a good standard type. The quality of joinery and
656 masonry or concrete work improved, one fairly skilled
[335] workman usually directing the householder and friends as
[333] amateur builders. The cost of materials was met by a grant, generally of £250, half being repayable by an annual rent of £6: 10s. for twenty years. Repayments proceeded satisfactorily. No scheme organised by the Department of Agriculture for Scotland won so general a commendation as this of house improvement. It made good use of family initiative and responsibility, with neighbourly co-operation not called for upon a large scale, a township at a time, but in quite a small, personal way. Nevertheless, had more guidance been provided to the builders, the
[464] houses could have been really well built. For lack of this, perhaps, crofters increasingly prefer to pay for skilled work, though helping actively. Appendices I (ii) and II (ii) gives pre-War and post-War statistics.

3. *The Township and its Changing Plan*

361 Where absence of rock and boulder permits ploughing,
[182] the village land is laid out in a series of parallel strips,
[491] aligned with the slope. The road runs either parallel with shore or river, or at right angles to it. The intermixed possession of strips by 'run-rig' characterised the Lowlands before the Enclosures, and is frequent in
• [423] the Highlands and Isles. The apparent regularisation of field lines may conceal the fact that an individual holder's plots may be scattered amongst those of others in fixed
[182] run-rig. This is an advantage where quality of land is so patchy, and each man thus gets his share of good and bad

361 luck in land, but a disadvantage where control of a single
• [423] area is desired by one man. Regularisation of roads,
[182] houses and holdings is relatively modern, for crofts and dwellings were once grouped in hamlets usually close to
[172] the seashore. The early hamlets can still be made out from their ruins among the rocks, sometimes sketched in the 'six inch to mile' Ordnance Survey plans. They were without formal order or arrangement, each homestead within its boundary wall. Where ploughing was and is too difficult, the soil is heaped up in ridges, 'lazy-beds', and dug.

361 Shawbost, on a rocky part of the west coast (six miles
491 south of Barvas) consists of three main sections: a scatter of houses and ruins by the enclosed loch, two main streets linking the loch to the main coastal road, and inland another short street. The three can be made out on a 'quarter-
[175] inch' map. The two main streets were laid out by the
[311] Estate Officers following removals in the mid-nineteenth century from another part of the island, Uig, and the third running inland was laid out still later, when population was growing and land was needed. When the third street was laid out, the landlord, Matheson, lent good plough-horses for preliminary reclamation. The irregularly placed black houses near the sea are tending to be rebuilt close to the main road.

361 In addition to this type of movement, farms 'broken
178 up' once more into crofts have been laid out on a regular grid plan, each house placed on a corner of its five, ten,
311 or twenty-acre plot (*e.g.* Galson, Dalebeg, etc.). 'Skinned'
[654] land may also be reclaimed for crofts by squatters tolerated by the community, or on a regular grid by agreement of the assembled crofters, guided by the Department of Agri-
[491] culture. Thus two distinct tendencies are seen: the grid plan in new settlements, road alinement in existing ones.

(c) FARM-TEAM AND BOAT'S CREW

175 The strictly equal division of rent on each joint farm
241 shows the equality of sharing among its workers by 'run-
427 rig'. By this system, periodic pooling and redivision kept the land in convenient blocks, a wet part here and a dry
476 one there, all shared out to give each man an equal chance
• 423 whatever the weather might bring. Such sharing was not mere static division of goods: it was the means for co-operative work, in ploughing and harvesting, or cutting peats, on land, and in manning a boat for the fishing.

175 For ploughing, two or three men were needed—one
241 leading the horses (walking backward and singing his en-
476 couragement), a second to hold the plough and perhaps a third to turn the sods; but four ponies abreast were needed to haul the plough, and each tenant possessed only one or two. In addition, the plough might be preceded by an instrument to clear the ground, a 'reestle', requiring two horses and one man. A Gaelic proverb notes the selection needed in the horse team, and one disabled by age could be replaced as leader by another. Ploughing was necessarily co-operative.

175 The rockiness and hilly ground of Uig and Lochs
241 diminished the usefulness and, no doubt, the number of
[182] ploughs, but the importance of their fishing was some compensation for poor agriculture. In 1790 there were
[134] ninety ploughs in Barvas parish, where they were no doubt
[226] of ancient usage: a ratio of one plough to five families, or one per joint farm. To judge from the smoothness of Stornoway parish, ploughs were probably used there in a similar ratio.

175 While some jobs were done by no more than two people,
476 —as when a ridge or 'lazy-bed' was put in order, the

175 couple advancing one on either side of it—many other
476 tasks were definitely team-work. Such was peat-cutting.
175 "When they are making peats, five people are employed.
476 One cuts the peat, another places it on the brink of the ditch where it is dug; a third spreads it on the field, a
314 fourth pares and cleans the moss; and a fifth man is resting,
[462] ready to relieve the man that cuts. The women are seldom at this work, but the men help one another alternately; sometimes they must rest satisfied with fewer hands; but the above is the full complement of men required to per-
[127] form the work, according to their tastes." Buchanan's
[178] description was written 160 years ago (1793); it remained true till recently and generally it is so still. There was thus a normal team practice for work—even a man to rest was not
[538] forgotten! As the Gaelic proverb puts it: "They won't make power (add strength) without a threesome and they'll limp without a foursome!" (*Cha deanar treine gun triuir,*
[802] *'s bidh iad crubach gun cheathrar*). In Gaelic, as in Scots, one speaks of a team according to its number, as "a pair, a threesome, foursome" and so on, up to a tensome (*deichnear*). In Lewis the farm-team was usually a foursome or fivesome.

175 Only in exceptional cases was land worked and held
• 423 singly—as when a smith was kept busy at his anvil in ploughing-time and harvest. Thus in 1715 one or two
241 rural smiths had single holdings of average value or more
[320] (£1), and one artificer or tin-smith (caird) a holding of minimum value (5s.); and in the burgh all the small plots
[286] were held singly. As the women wove, at home mostly,
[462] no male rural weaver held a single plot; his weaving could be done at slack times, so long as there was light; at busy times he worked on the land with the rest of his team.

000 On the mainland, both Lowland and Highland, an

175 593 423 241 311 184 224 823 175 361 511

on the mainland, both Lowland and Highland, an outlying reclaimable patch of arable, lying near distant, little-used pasture, frequently gave a single family the chance of a living. Such a site meant solitary toil for the man and his family; but there might be advantages such as an occasional deer from the forest, or a post as hunting 'forester' such as was held by many a Gaelic hunter-bard. In the Eastern Highlands such a high-lying croft was known as *Ruigh* (anglicised to Ry-). Traditions of poverty with individuality in isolation were handed down, for example, from one of my forebears who held such a *ruigh*, Rycorrach, one of several strung out along the 1250-feet contour in a small, high valley off Strath Spey; the last of them was abandoned only recently. Such a *ruigh* may have originally been a summer shieling, only occupied when shortage of corn-land below, coupled with new possibilities of a little profit from sheep-shearing, led to settlement there.

178 361 224 233 361 621 184

At the fringe of the Island's deer 'forests' of North Harris and Park, stalkers are still found in lonely lodges and dwellings, individuals often of character and worth, as they need to be; and a few isolated shepherds, such as one finds on mainland sheep farms, dwell on small islets. But in the Isles, isolated, high-lying spots for single crofts are rare. And the clearest distinction must be drawn between the true solitude of a single, isolated cottage or croft and the sociability of a group of four or five, or even two or three, crofts, such as those of lobster fishers; for even a few families form the germ of a community, in work and in leisure.

175 178 654 476 241

The potentialities of co-operative practice were overlooked by agricultural reformers, excusably enough. For when new methods were required, run-rig kept back the pace to that of the slowest, virtually arresting reform. Soon

175 178 241 476 654 423

after 1800, John Walker wrote that run-rig, "formerly very general in Scotland, was abolished with improvements but still subsists in many parts of the North. A number of tenants of the same farm have a common pasture for their cattle, and the arable is divided among them, by ridge and ridge alternately, which each cultivates for his own behoof. This gives them all a common interest in the crop and, when there was no inclosure by dyke or hedge, might be of some advantage" in giving each person some protection "against the encroachments of his neighbour's cattle". Speaking of joint possession this time, though without reference to survivals, Walker wrote that in the Lowlands "in old times a large farm might be occupied by a number of conjoint tenants who cultivated the farm in common and divided the produce. In this way the interest of each became the interest of the whole. They were ready, and were frequently called upon, to defend the common crop and cattle against depredations. There was then a necessity for such an allotment of land, especially in the Border country and in the Highlands." The team, in other words, was a unit of defence. But "nothing like improvement can be expected from farmers placed in this situation . . . [and] no community can ever equal the carefulness and industry of an individual in the management of his affairs".[1]

[127] [181]

So far as it goes, such an analysis is incontrovertible; for Walker was one of many contemporary observers who could contrast both the "improvement, industry and carefulness" of the best individuals under a vigorous landlord, with the sluggishness of old-fashioned ways on backward estates. The fundamental reason for sluggishness was that

[113] [1] John Walker, *Oeconomical History* [descriptive account] *of the Hebrides*, 1808.

175 178 241 476 654 423 [181]

the cultivable land and pasture having been shared out to minimal fractions, they called for a minimum of labour by the men—though housewives and mothers had always plenty to do. The morrow's tryst for work might prove a tryst with no work done. The men might foregather on the moor to cut peats, for instance, but if one of their number was late, become so absorbed by telling stories of the Fenians that, ere work had begun, it was time to go home—resolved to meet for work some other day! As a result, reformers advocated breaking-up the joint-holdings; and this was done in Lewis by 1830, as noted in the Brand Report. But mere division of the land did not increase its total amount.

175 178 654 362 423 476 829

Yet while noting the progress made by the liberation of individual initiative, we can see the drawbacks of individualism: the evictions made with no provision for new homes, and later the monotony and the loneliness of modern farm life, the mutual distrust of employer and employee, and the general inability of farmers, as yet, to co-operate. At the present, when planning, purchase and sale are required on a large scale, particularly among small-holders, the interest of each is still "the interest of the whole". The team-spirit must be recovered from the work (not simply the play) of school onwards to further education and communal effort.

175 241 427 476 423

To sum up, every farm-hamlet was held jointly and on equal terms, each joint holder being responsible for an equal share of the rent, and the movable run-rig system ensuring equal quality, as well as equal quantity, of land. Common interest was assured, and there was mutual support in distress or sickness, as when one member, named in a deposition of 1718, was 'valetudinary'. Lastly, work was done in common not only when it led to efficiency

175 241 423

through division of labour or united effort, but simply for the sake of mutual stimulus and pleasure!

427 476

(D) THE SHARING OF MACHAR, MOOR AND SEA

175 632 241 423

Embracing several joint-farms, each with its team or crew, came the township. The township had not only its common pasture, it had a special extensive system of run-rig on sandy, coastal machars, as in parts of the Island and in Uist—a system continued to this day.

632 241 423 [178] [127]

On the machar of Barvas, cultivation strips are still re-allotted periodically, as they were annually on all the Island machars. The machars behind the 'storm-beach' dunes of the Outer Hebrides closely resemble one another, from the Butt of Lewis to Barra Head. The immemorial system was noted by Walker and more fully by Carmichael, who called it 'intermediate run-rig' to distinguish it from the run-rig of older joint farms on boulder clay, and it persists at the present day.[1] In North Uist the machar land is laid off in large scatts or fields. Each scatt is divided into as many rigs as there are crofts in the township. There may be a dozen scatts in all, and usually half the number are lying out in natural pasture, but they are put under crop in rotation, so that each year one or two scatts will be brought into cultivation, and the others left out after a course of cropping. When a scatt is to be brought into cultivation the township 'constable' (who holds sway under the district ground officer) appoints a day for allocating the rigs.

[625]

[113] [1] Walker (1808); Alexander Carmichael, appendix xlviii and xcix, pp. 213 ff. and 451 ff., Report of the Crofters' Commission, 1884. Socially these form the most significant evidence in this great Report. See also "Grazing and Agrestic Customs", *Celtic Review*, 1905. Ct. C. Macdonald, *Scot. J. Agric.*, 1919. See also his lively accounts of machar and pasture: *Highland Journey*: *Suil air ais*, 1943.

423 632 241 rigs. The rigs are numbered and then balloted for by a double ballot. First the men approach the hat in any order and pick out a number: this is to decide the order in which they will approach the hat in the second draw. The second draw then decides the number of the rig. The crofter retains the rig while this particular scatt remains in cultivation, usually for a period of two or three years. The machar is shared by the whole township. The crops grown include a light type of oats, barley, a little rye, and potatoes; and clover may be cut.

423 244 [624] In the division of the machar for potatoes at Barvas, there are now no such hard-and-fast rules. The Common Grazings Committee select a certain area for cultivation and each crofter is allowed to take as much land as he requires within this area. This land is only cultivated for one year in six to ten years, and then reverts to grass. If cultivated for two or more years in succession there is a danger of the sand being blown away, and grass would be difficult to establish again. Potatoes are now the only crop grown on the Barvas machar.

[134] 175 423 241 Beyond the machar of the Isles lies the moor with its fringe of reclaimed croft land. By Carmichael's day this was held in individual portions, though, as he said, most of it was once held in 'farms' in run-rig practised by small units, not by the whole township. Why this difference between the arable of the machar and of the moorland? Carmichael did not explain it.

134 241 Three explanatory points are, first, that the whole cultivated land of the scatt or the machar is continuous, whereas the moorland is hummocky and boggy by turns, and cultivation is therefore patchy; secondly, that, unlike the stony clays, the light shell sand is easily forked or ploughed and needs no 'team' to plough it; and thirdly,

that no initial reclamation had been needed on the scatt. In each year of cultivation, it is true, manures of a sort, principally seaweed and sooty sods from the roof, are applied; but they form a temporary improvement only for the crop to be taken, and do not constitute reclamation. After manuring, the grasses and clovers are simply turned over and the land, 'rested' and manured by cattle, straightway gives its best crop.

It is otherwise with what is won from the moorland. As Dean Monro wrote of the reclaiming Lewisman in 1549: "In this country all is peat moss-land at the sea coast" (the long machars of the west of Uist give place to rocky coasts round much of Lewis), "and the place where he wins his peats this year, there he sows his corn the next year; after that he guids it weill with sea-ware". Even where the slopes are fairly smooth, the peat land has not the uniformity of the machar and the continuity of its arable strips. In addition to sea-ware, sand may be brought by creel or by pony pannier to reclaim peat, forming a heavy burden. Moreover, the first crop is always a poor one, and may be almost lost. Although in his brief notes Monro used the singular 'he', we know that the peat was usually cut co-operatively by teams. Hence most of the hard labour of reclamation may, indeed must, have been done co-operatively too, but by small teams, not by the members of a whole township together.

The sharing of common pastures is the last, but important, feature of land holding in common. The two kinds of pasture required were, firstly, those close at hand, animals being tethered or herded in the crop-growing season, and secondly, the more distant summer pastures. The people of certain townships, which were without a large outrun close at hand, had to go some distance to

reach their shielings. From Point district (Eye Peninsula) the cattle are still brought inland to the moors south-west of Stornoway. And from Bernera on the west the cattle are swum to the hills of the main island, just as they once were swum from Bute to the hill-pastures of Cowal in Argyllshire across the Kyle at the 'Strait of the Swimming', Colintraive (Caol-an-t-snaimh). Nothing could be more natural, indeed inevitable, than pasture in common where large, open moors were to be found. The number of animals allowed to each holding was duly apportioned and then, as now, was known as the summing or 'souming', still checked at the annual gathering (*cosgoradh*).

Thus a cluster of conjoint farms shared "the grass on the Ben and the tillage on the machar" (*Fiar air beinn agus peighinn air machair*). Along the shore, sea-ware, driftwood and the like were allotted, too. And, as Carmichael put it, there was even "run-rig at sea", for the fishing banks were allotted among the available crews. Most of these rights are still shared by the members of a township. But any crew can now fish freely where they choose, and no township can legally keep away strange boats, nor even steamers beyond the three-mile limit. This loss of communal rights stands in the way of remunerative fish-farming and its promise.

Profound social implications distinguished these three concentric circles of community: the family; the farm-team and boat's crew; and the larger, township group. These implications concerned labour, duty and right. The labour of reclamation gave a 'right' to the land thus won from the moor; and the duty of labour together, for fruits equally shared, gave the farm-team and fishing crew cohesion on land or sea—team and crew working for a common purpose. On the other hand, as individual sharers in the common

621 pastures of machar and moor, each man had not so much
• 423 a 'common interest' or duty as, individually, a 'like interest' or right. As now, each unit, whether team or individual, would tend to desire a maximum stock for itself, perhaps hoping it would have "the luck to rear" a little more than its apportioned souming, at the risk of the over-stocking which results in common loss. But though need, greed or rivalry offered temptations, morality invited careful sharing and was enforced by common interest.
423 The chief distinction between team and township was that
476 the tasks of the farm-team were constructive and, like that of the boat's crew, active and co-operative. It is true that in
632 the township certain tasks were co-operative, such as the wolf scaring of old times or the fox 'hunting' or shooting on mainland moors today. The modern gathering of sheep is also done together. But no constructive effort was involved in the allotment of shares on the machar or of stock on the moor, which were—and remain—matters merely for communal control, not communal effort.

511 Now, the quality of a group alters with its quantity. The intimate cohesion of a very small group of no more than half a dozen members, diminishes with an increase in number; but increase brings a compensating gain in diversity. Ten or a dozen people tend to break up into sub-groups, whether for small jobs or to enjoy conversation. The smallness of a group limits the number of relationships; an increase in number multiplies sub-groups, and life is enriched. After living long with fewer than half a dozen acquaintances, the same subjects keep cropping up in talk, the same tales are re-told, too often, and people cannot get away from one another's idiosyncrasies! A very small addition turns the scale by renewing variety.
621 Here lay the social value of a township and neighbourhood,
476

[621] Harris by Macleod, and finally of Lewis by Seaforth
1844.[1]

(B) NEW OWNERSHIP AND CAPITAL IN LEWIS 1844–78

175 Lewis was bought by Mr. James Matheson, a gentlem
423 of Highland family, whose fortune had been made in Chi
Sir James (as he became) put much capital, effort a
goodwill into the management and improvement of t
Island. Of the amounts expended we may distinguish,
far as possible, what he spent as a rich man for his priv
[131] pleasure from what he spent for the people. No soo
had Matheson bought the Island than the 'potato famin
of 1845–46 broke out. The terrible loss of life in Irela
and the depopulation of that country which followed, wou
have been equalled in the Isles but for the action
landowners like Matheson—who were the descendants
'kinsmen', not of alien conquerors—and also of subscrib

[1] A sketch map of Harris showing the areas cleared (1816–54) and a
settled as a result, together with those re-settled by government help a
1900, is given by J. B. Caird, *Scot. Geog. Mag.*, vol. 67, 2, 1951, p. 94.

159 weighed the estimated expenditure necessary to complete
433 the unfinished projects, and their prospects of success,
comparing these with similar conditions on the East Coast
228 and at Fleetwood, and with the trend of prices. His
decision was to close the venture, and Harris was sold.
[423] The skeletons of the works were left to rust beside the
quay, while the wreck of a coal steamer was left unsalvaged,
to break up slowly upon the rocks outside, a symbol of a
lost enterprise.

2. *An All-Round Policy for Sea and Land*

185 From the 'start' in Lewis, the first Lord Leverhulme
had shown his vision and grasp as a planner. Survey pre-
ceded plan, and decisions were swiftly put into action.
185 Why then had abandonment and failure followed? Per-
114 sonal factors have been over-stressed. 'Crofters' have
been accused of stubbornness, the Scottish Office of
procrastination and Leverhulme of impatience or obstinacy.
Stornoway shopkeepers have also been apportioned their
share of blame; and while all of them welcomed the
advent of Leverhulme as sure to bring money through the
crofters' pockets to their own tills, it is possible that, later
on, some of them did prove Devil's Advocates, having
come to fear the rise of competition by co-operative or
other large-scale concerns, should the town expand at a
[181] rapid rate. Stressing other factors of character and incom-
patibility, one popular Scots author went so far as to praise
the Lewis crofter for preferring a spiritual life with poverty
on a croft, to easy work and high wages in a town. There
runs a story, well vouched for, which might seem to con-
firm this. After Leverhulme had held forth upon 'work
for wages', in a township where there had been pressing

159 schemes, and knowing how much local fishing depended
458 upon international policy, particularly the resumption of
433 trade relations with the chief customers of the past, Lever-
hulme, one feels, should have dealt no less outspokenly
228 with these. The removal of trade barriers lay not in the
[656] hands of the Scottish Office or of Scots officials (however
internationally minded these might be as private citizens),
but in the hands of Ministers of Cabinet rank and leading
financiers, of whom Leverhulme himself was one.

458 In brief, the Scots fisheries suffered after the war as
neither Leverhulme nor others had foreseen when first
433 he laid his plans for the Island's prosperity. It seems
228 clear that had this major change been squarely faced
by Leverhulme and Government alike, in 1920, 1921 or
[423] even later, they could never have fallen apart about a
relatively minor issue, that of the farms. Both sides turned
their faces away from this disquieting factor of the Baltic
markets, though both knew it to be fundamental to the
success of Scots fisheries and the Island's future. Had they
faced it together frankly, then, even if powerless to effect
a remedy, their sincerity might have prevented a deadlock
upon a secondary matter.

159 To Leverhulme, given his large scale of expenditure
423 and return, the division of a few farms formed a minor
issue. But to a number of ex-Servicemen, 'crofters'
185 without a croft, the division meant a home and relative
433 stability. Moreover, what was merely a matter for personal
decision to Leverhulme, was a lifelong issue to many people
423 brought up in congestion on the wrong side of the boundary
[438] fence. Meantime, milk from Easter Ross was available in
Stornoway, at town if not at country prices. Lastly, further
possibilities of land-development lay open to Leverhulme,
[114] though not so readily to the unaided people. In reading

114 reports of early speeches by Leverhulme, Professor Patrick
185 Geddes had quickly come to feel that his old acquaintance,
• 423 Leverhulme the industrialist, might have overlooked such agricultural potentialities as existed, and that he had quite
433 overlooked the social significance of land. Hence, in May or June 1919, Geddes proposed that a survey be made by one who knew the Highlands botanically, who was experienced in agriculture, and who had some knowledge of Highlanders at home and of sociological factors. Geddes
[123] suggested Dr. M. E. Hardy for the task. Leverhulme forthwith accepted the suggestion and commissioned Hardy, whom the present writer assisted on the Island.

311 Examination of the farms, so hotly debated, showed that they possessed little or no initial superiority over neighbouring crofting settlements. That the farms were placed in the best coastal tracts for agriculture is true, but their shores are at the same time the poorest in harbours and fishing facilities. As a result, the crofters dwelling near the farms along parts of the same machars and smooth slopes were 'crofters' who sometimes fished, rather than fishermen with a house-site and a potato patch. As Hardy wrote (in his MS. Report): "The chief superiority of the farms resulted from levelling, drainage and enclosure" by landlord and farmer, sixty or seventy years before. The improved land both of farms and adjacent crofts was reclaimed from peat and machar, or from an admixture of both. "How then", asked Hardy, "did so much value
[423] come to be attached to the farms? The traditional grievance (of eviction) led neighbouring crofters to turn their eyes towards the green patches of the abandoned villages and endowed the old land with special virtues. After the Crofters' agitation of the 'eighties, successive Boards came with their eyes already focused on the farms, by the

311 cottars' claims." Thus a few of the settlements reclaimed
• 423 out of the common peat by some scores of people, hundreds of years ago, long worked by joint tenants, then by sub-tenants, " and later turned into modern farms, came to be regarded as the only available land open to crofters in the Island ".

311 Hence, Hardy concluded, it was important to tackle
433 some reclamation of peat or of land partially covered by peat, along with the development of the main commercial industry, fishing. The specialisation of commercial fishing was "a wise, indeed an indispensable preliminary step" in a constructive policy framed to deal with the Island as a whole. One saw that the formula "All Lewismen are fishermen" was an exaggeration, and that some of those whose forebears had dwelt by the machars of Broad Bay for centuries were landsmen first and seamen
185 second. Yet the specialisation planned by Leverhulme
311 would not only have given a chance to the seamen of Ness, Eye Peninsula, Lochs and 'the Bays' of South Harris;
[433] it would also have begun to relieve congestion, giving a croft and outrun to some of those who wished to make small-holding their principal means of livelihood and life, and providing a market for fresh produce on the Island itself.

Looking back, it seems clear that Hardy was right to report to Leverhulme (in 1919) that, while the great fishery scheme was indispensable, it should be complemented by a scheme for occupation on the land for those who wished it. The major problem of land being the amelioration of peat, continued Hardy, it should be tackled with twentieth-century knowledge and equipment. Slopes were to be found, favourable to reclamation, where peat had been thinned by cutting, where it was shallow from good drain-
[433] age, or lighter in texture from admixture with sand. Had
[159]

in Scottish cities, who came forward again in 1888 and in 1892. Of the £40,000 Matheson expended on meal and seed potatoes for relief, about half was repaid in labour by the recipients. Over the years the outlays reclassified from the Inland Revenue (1904, p. 205) is:

Cattle buildings and grounds and shooting lodges	£120,000
Buildings and Land reclamation	£100,000
Roads, Piers and Communications:	
Chemical Works, for manufacturing paraffin oil from peat	£35,000
Roads and Bridges	30,000
Brickworks (from local clay)	6,000
Sent Slipway, Quays, etc., at Stornoway	10,000
	74,000
Other expenditure :—	
New Lewis Steamers and Mails	£38,000
Industrial and Other Schools	18,000
Emigration (2200 persons)	12,000
Miscellaneous	8,000
Relief (Meal, etc.), gross outlay	33,000
	90,000
Total expenditure, other than on Cattle, etc.	264,000
Original Cost of Island	190,000
GRAND TOTAL	£574,000

Thus, of a capital outlay of over half a million pounds, roughly a quarter of a million was spent directly on the development of the estate. The rental in 1844 (exclusive of feu-duties) was nearly £11,000, and this rose to £18,000 within a few years, though it had been reduced to £15,000 at the end of the century. It will be seen that the praise which the James Matheson for his liberal expenditure as well won, if allowance is made for the standards of his age and generation. Yet of the £120,000 he spent upon

175 the mansion, lodges, and grounds or 'policies', much was
[177] burnt in a dark and cold time; but at the time, though part was
[178] for reclamation. This contrasts with his provision for
● 423 those whose homeland he had bought—the sum spent upon houses. Water and gravels being nearly half that spent directly for the good of some 20,000 fellow-Gaels.

175 Matheson was not technically equipped for his chosen
[176] task of 'reconstruction'. Nor was he fitted by trade or
157 the East for the leadership of a people accustomed, in
[173] spite of dire poverty, to considerable freedom. Ignorant,
[174] moreover, of the language of the people, his choice of a
175 later Factor was hardly a happy one. Tradition in Lewis
[176] speaks of this Donald Munro as an 'autocrat', and evidence
423 in 1874 confirms it. In addition to being the Factor for
[173] the estate and so holding economic sway over the
[174] people, he held seventeen public and semi-public offices
[161] in the Island, from Justice of the Peace to Captain of the Volunteers; and his influence held by his client 'the extent of his sway is also shown by his having served summonses of removal upon fifty-six families on his own authority. And in a report of the treatment of the officer sent to serve the summonses, three crofters were tried on a charge of "assault committed on an officer of the law in revenge for having executed his duty". When asked in court if Sir James would not have disapproved of this step and the manner of its execution, Munro replied that it was his practice "never to trouble Sir James with small matters". "Then you consider the eviction of fifty-six families a small matter?" was the retort. These 'Berneras tenants' were found not guilty, they and their neighbours were well in possession from before the Factor deemed it office.[1] Lewisers felt that to be a moral victory,

[1] Brand Report, 1901, p. lxxi.

175 which heartened them for resistance in common against
[177] farming in the interest of a few industrialists, in the agitation for reform of the
[178] Land Laws during the next ten years and in their demands
● 423 for 'the return' of sheep farms to crofting, which continued
until all those were divided soon after 1919 and the ex-Servicemen's return.

175 Expenditure of capital in Lewis during more than a
[176] generation, from the purchase of the estate in 1844 down
● 423 to the death of Sir James in 1878, helped to maintain the
[173] people and provide relief in bad seasons. It left Lewis
[174] greatly improved in roads and paths, in sea communica-
175 tions and in buildings of various sorts. Two real efforts had
[176] been made to utilise Lewis peat, industrially for paraffin
311 oil, and agriculturally by reclamation. Given the resources
[161] of Stornoway and a century ago, these attempts did their initiator credit. Yet failure left the Islanders to continue crofting without either an additional occupation or the extension of croft land, even to the 'allotment' (half-an-acre) of arable which Matheson had found on his purchase in 1844.

175 Subdivision of crofts was the first result. A father
[176] would simply divide his croft between himself and a son,
423 who might not even be entered on the rent-roll of the estate, and the two lots would inevitably need more stock than before upon the common. The second result was simply 'squatting': the building of a house, perhaps with a tiny kailyard, on a piece of the 'skinned' land. As building went on overcrowding old sites, filth accumulated and springs were contaminated, crofting was hindered and cows became fewer per family, in spite of overstocking. By 1861 about twelve families had built on the cottars and squatters found in 1914 were already in occupation. In 1914 there were over 3000 statutory crofts in Lewis, their

175 rent averaging 31s., in addition to which there were over
[177] 1000 houses of the cottar class and 300 houses of the
● 423 squatter class.[1]

Lastly, Sir James trained no successor to follow up or improve upon his experience. At his death in 1878 Sir James was succeeded by his widow, and, nearly twenty years after, she was followed by a nephew and his son. But the expenses of Stornoway Castle and its burdens, accompanied by lower rents, weighed down the new proprietors.

175 Meanwhile, crofters had made paths, in sea communica-
[176] tions and in buildings of various sorts. Two real efforts had
[178] been made to utilise Lewis peat, industrially for paraffin
311 oil, and agriculturally by reclamation. Given the resources
[161] of Stornoway and a century ago, these attempts did their initiator credit. Yet failure left the Islanders to continue crofting without either an additional occupation or the extension of croft land, even to the 'allotment' (half-an-acre of arable) which Matheson had found on his purchase in 1844.

175 Subdivision of crofts was the first result. A father
[176] would simply divide his croft between himself and a son,
423 who might not even be entered on the rent-roll of the estate, and the two lots would inevitably need more stock than before upon the common. TO FISHERIES: 1750–1914

175 For the greater expansion of industry of the northern
[177] coastlands, Matheson had done comparatively little even
178 at Stornoway. In 1883, a former Factor (Mr. Mackenzie of Calgary) stated that he had constantly asked for aid to the fisheries, especially by the building of harbours, pointing out that the landlord would reap benefit in rent.[1] But Matheson had replied that the fishermen and fishcurers, the people engaged in the trade, should do this work for themselves. By the end of the century, harbours were being planned and built with State aid in the north, west and south-east of the Island (at Ness, Carloway and Uig, and Tarbert, Harris). In 1900 the Islanders possessed 150 herring boats, and in that year five boats from the Stornoway District sailed for the first time to Yarmouth, and two to Lerwick. For the year ending 31st March 1901 £8,000 was expended on fishery piers, the Government in 1883 appointed a Royal Commission of Enquiry under a fair-minded judge, Lord Napier. As a remedy, the Commissioners recommended measures based upon

175 Board, created in 1897 to develop agriculture, fishing and
[177] crofting industries, to form new holdings, to assist in migration,
178 and to provide public works such as roads, bridges and
427 piers. These powers were further extended by the Land
[247] Settlement (Scotland) Act of 1919, passed to provide land for ex-Servicemen.[1]

The Crofters' Act granted to the individual crofter most of the rights advocated by the Napier Commission, and other advantages besides. But it did not impose upon him the corresponding duties. As Day wrote, "The landlord was compelled to act in the interests of the crofter; the crofter was not compelled to act in the interests of the landlord." The Act discarded the core of the Napier Commission's scheme, that of "a recognised local community, the township, with an executive officer, the Constable, working for the improvement of the township, by fencing, draining and other works, with the assistance of the proprietor", the absolutely whole enforceable by "a township rate or other [829] rate". As a Gael might say, the Act discarded *duty-right* of members of the community to one another.

175 As a result, peace did not descend upon the Island at
[177] once. The demand for land continued, fields were taken
178 by attempts to settle upon it, in spite of police and armed force.
[668] A legal victory was to be pressed home. In Lewis the

[1] A useful summary of the legislation is given by the Scot. Econ. Committee's Report, 1938, pp. 19-21, and "a searching revision of *Crofter Public Administration in the Highlands and Islands of Scotland*, 1918, a work of real social insight.

The Act of 1919 is still the main enactment under which land settlement schemes may be undertaken in Scotland; but the Agriculture (Scotland) Act 1948 included new provision to allow the creation of holdings up to 50 acres in extent and 40 acres in arable area. After the Second War a more liberal policy was adopted in regard to settlement of ex-Servicemen and other applicants, and the Act was found not adequate, despite many unfulfilled applications in the Hebrides and elsewhere where the demand for crofts exceeds the supply.

I.L.H.—R

175 death of Sir James had left his widow in possession of the
● 423 estate, with a lady with little tender sympathy, Mrs. Matheson,
[166] in south-east Lewis, in November 1887, a body of landless men attempted to settle on the peninsula of Park, Loch Seaforth, after which some of the Hepal settlers or raiders were tried and acquitted, and fourteen small crofts with outrun were provided. In January 1888, 300 men marched from Barvas to petition Lady Matheson that the sheep farm of Galson should be allotted to crofters on a fair valuation, as they could not live on their tiny plots. Lady Matheson refused to consider the petition until the arrears of rent due by Barvas tenants should be paid. Shortly after, sheep were driven off Aignish (Eye) and police, reinforced by marines and soldiers, arrested eleven men. Two years later, the sheep were driven off Galson, fences demolished, and sheep driven off. On January 20, 500 marines were ordered to Lewis (of whom 200 actually sailed). On February 2, the Aignish raiders were found guilty and sentenced to terms of from nine to fifteen months' imprisonment. After this the disturbances gradually passed away. Yet the crofters could only be dormant; they were to spring up a generation later, and again after the war of 1914–18.

In defending the Napier Commission's plan to recog-
175 nise the township, one may accept their definition of it as
632 a farm held by tenants, singly or in common. Yet it must
[241] be remembered that the word 'farm' had come to have a
[244] very elastic meaning. The joint farm-group was once the active group for labour in common; but if the 'township' included several joint-farms, as it generally had in the Island, its people formed a much more extensive community. Members of the township enjoyed rights in common, and shared in duties of observance; but they had seldom to

175 co-operate in active endeavour. It was all the more
632 important to have a lady with little tender sympathy,
427 one of themselves but placed in authority. There could
[244] be no restitution of the old joint farms where they had
[674] been broken down by migration; yet it should have been still possible to extend the old spirit to the larger townships, as the Commissioners held.

175 Again, the constitution of the township is bound up
632 with the rights of common pasture upon the moor all the
427 year, and in winter even on unfenced arable; but the
● 423 Crofters' Act failed to regulate the rights and obligations
[671] of Common Grazings. It also neglected the township of the estate without restoring the hold of the tenant community upon its members. After five years the Government began to recognise the township, and passed the Crofters' Common Grazings Regulation Act, permitting the crofters to elect a Common Grazings Committee. But it was ill-considered; most of all because non-crofters, that is-cottars and squatters without legal tenure, were not bound by the Regulations. On one hand they could not get permission to 'reassert' (or enclose) a portion of the common in order to reclaim it as a croft, without first obtaining the unanimous consent of the township's crofters; and in large townships there might always be an objector. Yet each cottar could, and did, put on stock, a cow or two and a few sheep, so nullifying the possibility of discipline.

In 1908 a second Act was passed; but twenty years had allowed tradition to lapse and difficulties to accumulate. In Lale Scalpay (Tarbert) for instance, by 1909 there were only forty legitimate crofters, but eighty cottars; and the legal enforcement of the Act was impossible. Many cottar of such grazing liberties as he exercised. All were neighbours and most were relations, and their principle

175 was to share; the children needed milk and the women
632 had to work, while the men were away at the herring.
● 423 Commission put it at the time, "Necessity has no law and
[174] . . . it is scarcely possible to comply with the Grazings
[176] Acts in this island". The position remains little changed.
[178] Still, in spite of sixty years' delay, and the law's failure to
[462] restore an executive, the Constable, to perform specified duties as a member of the community, the Grazings Committees do perform useful functions with credit. They form nuclei with which proprietor, Government or co-operative agency actually deal, and the voluntary Clerk of Common Grazings is indispensable.

With regard to small occupiers paying less than £6
175 rent per annum and holding less than 10 acres and 250
423 acres of arable (or share of pasture), the Crofters' Commission declined to recommend the bestowal of rights or immunities tending "to fix them in a condition from which they ought to be resolutely, though gently withdrawn". The Act, however, did grant small occupiers immunity from eviction, and made it hard for either landlord, State or fellow-crofters even to refuse house sites or fresh holdings, particularly in the crofting counties. The support continues; indeed he is favoured, by escaping the payment of rent and rates though he shares in benefits. The ratepayers are proportionately, and unjustly, handicapped. But as isolation has diminished, landless squatters have been allowed to 'resume' portions of the common grazing for new holdings, as by common consent at Ness and in Locha, after Lord Leverhulme's death.

A further recommendation of the Napier Commission, was to aid emigration. Nearly 2000 had emigrated by 1891 by proved successful, but his later efforts met with no response. There were then, and still remain, the principle

195 for a firmer hold upon the land and for a return to aban-
198 doned sites. The communal possession of joint farms, held
433 directly or under tacksmen, gave place to individual pos-
(731) session of crofts. Yet the legal recognition of perpetual
(162) tenure in 1886 gave not only the crofter's home but the
(167) crofting neighbourhood a security unequalled in Britain. The use of moor and machar in common was retained; but its control for improvement or reclamation by the
195 estate or the township was weakened, rather than strength-
198 ened, by the Crofters' Acts. Confusion grew—both upon
423 the arable land, subdivided, unenlarged and unimproved,
427 and also upon the common grazing, sorely overstocked in spite of ever diminishing 'soumings' (or family shares) of cattle. Rating difficulties and anomalies appeared. Communal discipline, maintained at sea by fishing, was weakened on land after the abolition of the joint farm-group, and almost nullified in the townships by subdivision and squatting.

195 A year before the potato famine of 1845, a new landlord
198 had brought good-will, capital and pioneering effort to
433 Lewis. These had been directed to experiments in the
(427) reclamation and the industrial utilisation of deep peat.
(311) Helped by employment on these and other works, the
(161) population of Lewis continued to increase, when increase in Harris was arrested for a generation. Yet while neither experiment with peat met with success, little aid had been given to develop fisheries. In both parts of the Island a growing population was supported from the 'seventies onwards by help of earnings derived from the seasonal herring fishing on the East Coast and from inshore line fishing at home. Women added to the Island income by seasonal 'gutting' and, in Harris, by their spinning and
(167) weaving. Money was earned by work on the mainland,

423 In May 1918 Lewis was bought by Lever of Port
565 Sunlight, then Baron Leverhulme of Bolton-le-Moors (his birthplace), the head of a great combine with 50,000 white
157 and 25,000 black employees. Meeting him in Lews Castle
124 in August 1919, Dr. Hardy and I found him troubled by a human situation he had failed to diagnose. Short and stocky but very erect, quick-eyed and rapid of manner, and with a wide expressive mouth, he spoke earnestly of his plans; but his eyes flashed and his mouth set, as he rapped out, "They keep putting off, yet they leave the people in houses *not fit for Kaffirs!*" The question, "What objective inspired—or mislied—Leverhulme to buy the Island?" is answered by his son and biographer.[1]

159 By 1917 Leverhulme had felt it was time to devolve
423 his personal authority over his business, in the interests
433 of its future. Hence he looked about him for an estate in which he could exercise "his passion for changing the face of nature", and by experiment, trial and error, with drawing board and T-square, and for philanthropy.[2] He nearly bought an estate in the Midlands in order to develop it; but work had already begun there, and he wished to find a place which would be his to remodel from the start. Thirty years before, Leverhulme had visited Lewis and now in 1917 he spent a week there, motoring all over the Island. "He was enraptured . . . he saw not merely a countryside in need of more and better roads, not only a residence and grounds capable of alteration and improvement, but a problem to be solved, a human and racial problem which had so far baffled all who had tried to solve it. . . . He had been told the Lewis man was lazy,
(18) [1] Leverhulme (2nd Viscount), *Leverhulme: By His Son*, 1927, chap. xxvi, p. 211 ff. Lord Leverhulme, who had thought of styling himself 'Of the Isles' took the title 'Of the Lews'.
[2] Leverhulme (1927), cf. pp. 81-86.

159 stubborn and suspicious; he never believed it. He realised
423 that the backwardness of the Island arose from lack of
433 opportunity, and that opportunity he would do his best to provide. Wherever he went he found the same story—things half attempted, nothing done." Leverhulme, one felt in 1919, wanted to do all he could for the Islanders. A greater man would have wanted to work not only for, but with, the Islanders. Then, even if the fisheries had been ruined, as they were, by forces outside his control, he would have shared a moral victory, not shared and suffered economic loss, with moral defeat.

114 In the Isles for centuries before, a family and well-tried
183 friends were valued above all other things. What was more,
(198) this was still true in the lifetime both of the elder men and the women he found at home, and of the absent men, at war. The foundation for this friendly life was a plot of
159 land and work to do, a home and the leisure to enjoy it.
433 Leverhulme, too, valued these things in his own way. He
461 cared for human homes and gardens, and had proved it at Port Sunlight and elsewhere. A pioneer of industry and efficiency, he pled for 'a six-hour day' and leisure afterwards, and he had done much to realise the ideal in his own works. Moreover, he was not without respect for spiritual values, freedom, and a congregation's right to choose their pastor.[1] All these things should have helped to put him into sympathy with Island life, and up to a point they did so.

159 It is clear that Leverhulme had considered the possi-
423 bilities of improving the local fisheries, village by village;
228 and an engineer had reported on possible harbour improvements at Ness, Barvas, and elsewhere. But he came to the

[1] Leverhulme (1927), p. 211; and Leverhulme (1st Baron), *The Six-Hour Day and Other Industrial Questions*, 1919.

159 conclusion—undoubtedly a sound one—that the most
433 effective action for commercial fisheries (as then known)
228 must be taken at one Island centre, Stornoway. As a direct result he considered how to feed the growing town, in particular how to give its children fresh milk. He saw the farms round Broad Bay ready to be turned to high-class dairy farms, if capitalised, and for this purpose they were swiftly scheduled in his mind.

159 "His early days were happy ones"—wrote his son—
433 "but they were not to last for long. He encountered the first obstacle on his path in the late summer of 1918, when
423 the Scottish Board of Agriculture declared its intention to
(647) take over the few remaining farms in the Island for crofts." By this declaration the Board spoke for many Islesmen in the Forces. The voices of Servicemen, not those of either a Government or a philanthropic millionaire, counted overwhelmingly, on the Island and beyond. When the war
(727) was over and the men came home, many set about examining their boats and fitting them up with motors, and in a few months the evening's departure for the fishing from Stornoway had lost some of the picturesqueness of the old, stately procession of sail moving out to the Minch at sunset, but had gained in efficiency as the motorised boats went puffing out to find the shoals, sure of return without delay after the catch was hauled in. Yet fishing was still precarious: there might be no catch, and even if there were, prices were a gamble. Hence many a cottar-fisherman wished to ensure a home for himself and applied for a croft, with his eyes on the farms. Farms were few, and not enough to go round more than some 10 to 15 per cent of squatters and cottars. Still, a promise is a promise: the farms were there, why not have them and be done with it? Knowing this feeling in the Island, aware of its support

159 in the country, and foreseeing that the only sure way to
423 avoid irritation, friction and law-breaking was to grant
433 the farms and have done with it, the Secretary of State for Scotland and the Board felt that they could not withdraw the Government's promise of land. The Secretary for Scotland, Mr. Munro (later Lord Alness), spoke with knowledge as a Highlander. A general promise of small-holdings had been made to all Scotsmen in the Services, and could not easily be set aside at the wish of one man, then approaching the age of seventy, however well-intentioned, weighty and in earnest. Yet Leverhulme declared that while he would relinquish farms on the west side of Lewis, his schemes could not go on unless he retained the farms on Broad Bay to supply fresh milk for Stornoway. If the farms were divided, he said, he must close the whole scheme forthwith.

159 Of his earnestness Leverhulme left no doubt. He not
423 only planned but set up a retail agency, Mac Fisheries, and
433 he purchased drifters and trawlers, the Mac Line, to fish far afield and bring the catch to Stornoway, there to be
228 transhipped by his own carrying service. He set about building model dwellings in Stornoway itself, each with its quarter-acre allotment. 'Work and Wages' from capitalised fisheries was his offer, in further token of which, road-making and other wage-providing work was
(198) begun. Until 1920 the farms remained undivided. The farmers, for their part, could only wait for the expiry of
159 their leases, or for the transactions by which their leases
423 would be foreclosed and compensation awarded. Prices
433 of stock were high at the time, and the valuation would correspond to these. Hence tenants felt they could afford
427 to wait. Meantime crofters' stock wandered over their farms—whether because of the wilfulness of the stock or

159 of the owners—but farmers knew it was futile to protest,
423 and they suffered with a wry smile and a shrug of the
433 shoulders. After all, most of the farmers had stayed at
427 home and their affairs had prospered, in war-time; whereas all but the older crofters had had years of seafaring or fighting, and the nation's debt to them had not yet been forgotten. The farmers kept quiet and waited.

159 Meantime, Leverhulme made public war upon the
668 Government. Speaking in Edinburgh in November 1919,
433 he declared that "Reports, thick as leaves in Vallombrosa, have been the dominating feature of Government policy in the Highlands and Isles . . . but the invariable rule seems to have been, whenever expenditure of public money was recommended, for the Government either to ignore such reports or to cut down expenditure so penuriously as only to result in waste . . . by not spending to the full amount . . . Lewis and Harris have too long been
(213) the Cinderella in the Government pantomime."[1] The crofters, reading this in the daily papers, and again in the weekly *Stornoway Gazette* a day or two later, chuckled with glee, rolling the phrases on their tongues. They might not all have been able to explain the strange words, like Vallombrosa or Cinderella, though they sounded fine; but all had heard of pantomimes, and some might even have seen one, without saying too much about it to the minister. About 'penurious expenditure' they could have no doubt. Yes, a fine speech, they felt! Yet in spite of the sting of truth contained in such orations, these did not make it easier for Government to co-operate with the orator, to prevent raiding or to deal with it should it begin.

000 Raiding did begin in the spring of 1920. Applicants
[1] Lecture at Edin. Phil. Instn., 1920. Quoted in Leverhulme (1927).

669 for crofts in Tongue, a township north of Stornoway, took
423 the law into their own hands, seized one of the fields of the adjacent farms, and threatened to take the remainder. It is easy to understand that when a man has come home from the war to his sweetheart, and after being promised a site on which to build a home (even a black house for a start), with a plot for potatoes, and 'a cow's grass', a year's vain delay may breed impatience! Leverhulme motored to the township, and with his customary vigour and persuasiveness spoke of his plans for 'work and wages' to be constructed at Stornoway. He also declared that if the farms were divided this would cripple his schemes, and work would stop at once. The majority there agreed to fall in with his plans; in any case, only a
159 minority could find crofts on the farms. Leverhulme felt
433 that he had carried his point. He forgot not only that
669 his oratory deserved applause and had won it for its own sake, but that the people could not lightly afford to say 'no', if this meant immediate stoppage of wages. It was the after-thoughts on the morrow and in the following months, rather than agreement at the moment, that signi-
(228) fied. In 1920 herring fetched a fair price, the herring fishery prospects were encouraging, and work was resumed for a time. Yet one raid having begun and "the die having been cast", lawlessness spread unlidded. The farmers stopped expenditure, and obtained an interdict against the
423 'raiders', though he did not prosecute. After further
(694) parley, the Secretary for Scotland agreed to suspend
159 division for ten years, and in 1921 Leverhulme resumed
433 operations. "Unfortunately very soon afterwards", wrote his biographer, owing to "the general industrial depression
458 which followed the boom in trade after the war", Lever-
458 hulme felt impelled to close down work for the time being,

and he was unable to make plans or promises for the future. Meantime, it should be said, the Island herring catch and prices fell rapidly (the catch by 50 per cent and prices by 60 per cent from 1920 to 1921). As a result, crofts now seemed more precious than ever to the applicants.

With what Leverhulme regarded as 'almost indecent haste', the Secretary for Scotland proceeded to fulfil the promise to divide the farms. Most of the farms remaining were divided into some fifty crofts, of ten acres or so with outrun, supplying little more than 10 per cent of the landless men. The Manor dairy farm, near Stornoway Castle and town, though raided by a few men, was retained to contribute to the town's supply of milk, along with two or three smaller farms close to Stornoway (Melbost, and Stoneyfield with Holm). Leverhulme felt that his offer to Lewis had been turned down, and he then concentrated his efforts upon Harris.

At the extreme south of Harris (midway along the south-west coast), in the 'Hope' or natural harbour of Obbe, Leverhulme built new piers. He transferred the machinery of the canning factory and the kippering sheds he had commenced to build at Stornoway. He started to build houses, a number being provided on generous terms; and "at the people's wish", the settlement was renamed Leverburgh. With the transference of his energy from Lewis to Harris, Leverhulme's "optimism and determination were intensified", wrote his son. They were not to last long. After a visit to the Congo in 1925, Leverhulme died suddenly in Brussels. How far the new plans might have succeeded had Leverhulme lived, his son has commented, "remains uncertain". What is certain is that the second Lord Leverhulme toured Harris, visiting the works on hand and examining the accounts. No doubt he also

Crofts and Commons

423 A crofting area normally consists of the croft land proper - the inbye (arable and
427 unimproved land, and various common grazings. Table 20 summarises the situation in
311 Bernera. Kirkibost has by far the largest inbye and the Bernera island townships generally
632 are larger than those of Bernera Shore. That the positions are reversed with regard to
common grazings is due to the limited hill of Croir and the very extensive hill of Linshader.
The Bernera island townships woul', however, be much worse off for hill land had they
not various special common grazings (except Croir) and did they not share in the 4,341
acres of the Bernera shielings on the mainland. It is possible to calculate the appropriate
shieling share for each township on the basis that, though the theoretical soums for each
township and common grazing are exact, in fact all working units may send animals to the

423 shielings, and that therefore the shieling area per township is in proportion to the number
427 of working units in that township (total, 88 working units on the island). If these shares
311 are deducted it will be seen that only Kirkibost and Tobson common grazings exceed in
632 area those of Lundale, the smallest of the Bernera Shore grazings, and that even this is
so if the special grazings, mainly later enlargements, are further deducted.
All this serves to emphasise the relative crowding on Bernera Island and the consequent
490 vital importance to most working units of the shielings. This has probably increased in
the last decade with the construction of the bridge, for whereas previously there was a
biannual ferrying operation to the mainland, tedious, unpleasant, and exhausting for both
beast and man, nowadays droving to the hills is an easy matter.

A somewhat different picture emerges when land is related to tenants and working units (table 21). If the inbye per croft tenant is calculated it is seen that Croir has the largest, (29 acres), rivalled only by Lundale, (26 acres), Hacklete, Kirkibost, Earshader, and Crulivig form an intermediate group (11 to 16 acres), while Breaclete, Tobson and Linshader have but eight acres or less. However, the average area of inbye is more revealing if calculated in relation to working units: then the Bernera Island townships are seen to range from 7 acres (Breaclete) to 33 (Croir) while only Lundale has more than 20 acres, the others having 14 or less. For the whole island the average of inbye per tenant (13.2 acres) is close to that for the Shore (12.8 acres) and the inbye per working unit (13.5 acres: 13.3 acres) is almost identical. Thus, there is considerable variation in the amount of inbye land available per tenant and the amalgamation of tenancies into working units does not seriously change this distribution.

None of the Bernera island townships has as much common grazing per tenant, nor per working unit, as any of the Bernera Shore townships, (little more than 100 acres as opposed to never less than 160 acres). The Bernera Shore townships as a group have about five times more pasture per tenant and per working unit than those of Bernera Island. Breaclete stands out as the township with the greatest shortage of land.

The various forms of subdivision and amalgamation of crofts and parts of crofts, or other holdings, are summarised in Table 22. In the small townships of Bernera Shore only Earshader, with four crofters, has non-crofting holdings with stock; there is little amalgamation. In Bernera Island, however, only Hacklete has the same number of working units as of registered croft holders and Breaclete, the township with the greatest shortage of land, is also the township with the greatest degree of unofficial change and intromission. In contrast, Tobson, in spite of its unconsolidated plan, presents a simple picture. Breaclete also has the largest number of feus, including the only feus not
368 functioning as agricultural units. This emphasises its function as a centre for the island.
It has both manses, both churches, the War Memorial, the school and the District Nurse.

These changes must however be seen in perspective. The Bernera region has not
180 suffered from the type of amalgamation which is the result of decay and which facilitates
427 further decay; the actual change is not very great. The number of agricultural working units is 98% of the number of crofter-tenants. It is illuminating to compare the region with Sutherland where many former crofts, quite abandoned to rough pasture, have been taken off the rentals. Apart from changes due to clearances, the Bernera region has none of either type. Of 575 holdings examined in thirty-one townships in Sutherland, amalgamation has reduced the number of effective crofting units to only 437, i.e. 76% of the formal figure. Amalgamations by family co-operation are comparatively few in Sutherland (26 out of 173 known examples) whereas subletting is common. A further brief example may be taken from one of the Shetland islands where amalgamation has reduced the original number of holdings from something like 350 to about 250 working units.

423 Stock - potential and actual.*

The croft is in almost every case primarily a stock raising unit and cultivation apart
427 from certain items - particularly potatoes for domestic use - is connected with stock
231 rearing. The basis of the stock system is the soum, the share of the common pastures
311 in terms of horses, cattle and sheep. The largest total soums (more than two hundred
cow-units) are held by Hacklete, Kirkibost and Tobson; all the other townships have a
632 hundred or less cow-units (Table 24). This has some relation to the size of common
grazing. The very large area of Linshader is that of the former farm: the present

* Details of actual stock and souming for each township will be found in Appendix A.

231 soum is less than the capacity of the grazing and represents the Land Court's estimate
423 of the stock the crofters would be able to keep: the consequent discrepancy and retro-
427 gression in total stocking is a typical result of the replacement of commercial farms by
crofting subjects (c.f. page 25 above). It is better however to consider the area of
311 common grazing and soum combined: in fact, the average acreage per cow-unit is fairl
uniform for Bernera Island, (8.7 acres). Bernera Shore has a wider variation of from
632 11.6 to 100.9 acres per cow-unit: obviously, either the Bernera Island townships grazi
particularly Bernera shielings, were originally estimated as of superior value, or, for
whatever cause, the common grazings of Bernera Shore are relatively under-used. H
is this reflected in practice?

TABLE 25

Bernera District

Comparison of soums and actual stock,

by townships.

	Average soum per working unit	Actual stock per working unit	Soum held per working unit	Working units with less than 50% of their soum
Bearclete	6.5	5.5	84%	19%
Croir	6.2	7.0	114%	nil
Hacklete	12.9	9.5	73%	25%
Kirkibost	10.8	6.7	63%	29%
Tobson	13.3	6.3	46%	58%
BERNERA ISLAND	10.6	5.5	66%	43%
Earshader	6.3	10.9	174%	nil
Crulivig	8.4	11.8	140%	nil
Lundale	9.0	10.4	86%	nil
Linshader	10.6	10.2	96%	22%
BERNERA SHORE	9.8	11.6	114%	8%
BERNERA DISTRICT	10.6	6.5	75%	20%

Note: all soums and stock are calculated in "cow units", using the sheep equivalence s
given in the Grazing Regulations.

(B) SLOW CHANGE: 1925–39

1. *The Land, the Sea, and the Loom*

When Leverhulme parted company with the people of Lewis his gesture of farewell was one of generosity: the offer of Lewis to its people. The Stornoway Trust was formed, and this accepted the gift of the adjacent crofting townships of the Parish, and of the Castle and its beautiful Park or 'policies'. In crofting townships, however, the people declined the offered gift of land, finding that they could not afford the augmentation of rates entailed by acceptance. So the remainder of the estate was offered for sale in several lots, which were bought by individuals and have proved safe investments. The letting of sporting rights adds a further, albeit a variable, return of income to that of the rents received. It is indeed anomalous that a crofting estate, such as a Lewis parish, can yield a good return to a purchaser, yet that the crofter-occupiers themselves would lose by receiving it as a gift.[1] Much-needed improvements in housing would also be discouraged, for fear of increase in their rates. It is true that if (under existing laws of assessment) all the farmers and crofters, cottars and squatters of a county were to become owners at the same moment, the total increase in assessments would either be repaid in greater services or met by lowered rates

[1] The reasons (as indicated in Chapter IX (B)) are briefly that a crofter (or 'small landholder'), as occupier of an agricultural holding, can only be assessed at three-eighths of the occupier's half of the assessment on his Fair Rent, *i.e.* at less than a quarter of the whole rental. Although he may have built a good house and other buildings he is not assessed at their full value; neither is his landlord. Were he to become owner he would then be liable to assessment both as occupier and as owner, on the full annual value of land and of buildings too; with deduction of five-eighths on the agricultural value as occupier only.

—or by a compromise between. But as it is, if one crofter, or a small group of crofters like those of a township or parish of Lewis, were to become owner-occupiers (even by gift), they would be penalised as compared to others. Hence the Lewismen preferred to go on paying rent as statutory crofting tenants. Leverhulme sold the land and received the price; the new owners paid for it and received an investment; and the only 'loser' on this curious transaction was the Local Authority, the County, which failed to make more in rates!

Further reasons why the great majority of crofters declined Leverhulme's offer have been given by the Lewis Association's Economic Committee (1944):

(a) As individual proprietors, they would lose the advantages of the jurisdiction of the Scottish Land Court in dealing with their disputes, and any litigation would take a more costly form.

(b) They would be debarred from obtaining loans from the Department of Agriculture for Scotland for the improvement of their holdings or houses; as the Department would no longer have the "Corner Stone" of a landlord to fall back upon in the event of renunciation.

(c) The crofters were afraid that as individual proprietors they would forfeit their share of the Common Grazing rights.

(d) Should they wish to quit their holdings they would be compelled to find a buyer in the open market, instead of renouncing to their landlords and getting valuation.

(e) There is a feeling among Lewis crofters that they prefer to have a landlord before whom they can lay their difficulties and disputes, and who will attend to their wants; an authority that relieves them of responsibility.

As the historical evidence has shown, a lack of responsibility has been greatly due to the undermining and then the abolition of the authority of the township's own elected Constable.

The Trustees of the Stornoway Trust have not found it easy to meet the cost of keeping up the valuable property of the Castle and Park, nor to carry the burden of its rates, no adequate income being available for the purpose. Today, however, Leverhulme's gift is being put to good use as a Technical College, opened in September 1952.

Division of the available farms, after providing about 200 small crofts (of ten acres or so), still left the problem of finding legal homes on legal tenure for the remaining cottars and squatters.[1] The Department of Agriculture arranged to feu plots of 'skinned land' on the outrun of certain townships, including one in the extreme north and others in Lochs. About 200 of these little holdings with potato ground were provided. On the holders' behalf the Department feued land from the owner, after obtaining the consent of the Common Grazings Committee of the township and permission from the Land Court for 'resumption', *i.e.* for enclosure of a portion of the common. The legal and administrative procedure involved may seem disproportionate to the economic value of the holdings. Yet difficulties of law and custom had been allowed to go from bad to worse during the past eighty years; and these difficulties were overcome.

To encourage better housing in the crofting counties, loans are made to 'crofters and fishermen feuars' personally. Local stone, or latterly concrete, is used, and much of the building is done by the 'man of the house' himself, and his friends. From 1920 to 1940, nearly 1200 loans were made in Lewis and Harris for the erection (or improvement) of houses, and in a few cases for the erection

[1] Estimated at 1200 to 1500 shortly before, the open question was whether subdivision during the previous eighty years was to be recognised and accepted.

of new steadings. The average amount of loans (totalling £166,000) was under £150; repayment has been satisfactory, and the arrangements made by the Department of Agriculture won general praise among the people. Yet 1200 houses were very far from replacing all the 'black houses', and many more are needed.

In terms of cash profit, ten crofters today run their crofts less remuneratively than the farmer they dispossessed; even together they may show little more total production than the farmer. Nevertheless, these ten crofts each allow a part, at least, of the basis for a country home. Hence the weight of public opinion supported, nay, insisted on 'giving back' the land to the descendants of those who had worked it sixty or a hundred years before. The State bought the farm stock at a high valuation, and till lately without adequate reform of crofting use and wont. The farms having now been divided, a great emotional issue, which had smouldered for half a century, has been brought to an end. Although the practical results are small, the crofters feel that justice has been done, and that fact may be a great gain. Now that there is no more green reclaimed land to be had, the reclamation of the peat moor, or the grey 'skinned' boulder clay has to be faced.

By financing the renewal of Leverhulme's brief attempt to reclaim deep peat on Arnish Moor, south of Stornoway, the Canadian, T. B. Macaulay, made a resolute attempt to solve the island's main agricultural problem. Good crops were grown, potatoes and silage produced, and a dairy farm established. But the difficulties called for continuity of effort and research. From the practical point of view of 'demonstration' it had been a mistake to tackle deep and almost level peat, black in colour and viscous in consistency. There was not the light machinery required for cultivation.

And when laid down in permanent grass for the dairy herd, the land became water-logged in wet weather. The war called a halt to progress; and though much was learned, the farm was not a demonstration of success. Smaller experiments were made, with some success, in improving 'skinned' land. For both types of land, the cost of fertilisers, even more than of labour, was the chief economic difficulty.[1]

A difficulty which aggravates 'congestion' in crofting townships is that even a small croft may consist of several plots. This was only too well illustrated, as late as 1935, by the dilemma in which a crofter found himself, in a township north of Stornoway. This crofter's land was in at least five separate strips, mixed up with the land of four neighbours. The township and the plan of the holding are known to me. As the crofter complained, he could not walk round his present cottage, nor bring building materials for a new house to the site, without trespassing. He could not even put up scaffolding because the stays at each end would project on to the holdings of his neighbours, who objected. The Land Court has power to re-allocate the land in self-contained holdings. This crofter had twice asked for this to be done, but on each occasion neighbours opposed the application, and it was not granted. As he could not replace his present house by a modern one, he applied to the Stornoway Estate Trustees for another croft in a neighbouring township. When the Trustees saw a plan of the holding they described it as a jig-saw puzzle; but having no holding to offer him elsewhere, they could only ask the Factor to try to make an amicable arrangement with the man's neighbours. This case is extreme; yet it

[1] W. G. Ogg and Angus Macleod, *Scottish Journal of Agriculture*, 1930–36.

311 illustrates the narrow margin of habitability on these frag-
241 mented holdings.
• 423 Now, in Lewis periodic pooling and exchange, or the
241 practice of *movable* run-rig on the small joint-tenants'
423 farms, was abolished early in the nineteenth century, except
476 upon the machar, where it still continues. Apparently the
178 strips were simply fixed where they had last been appor-
(175) tioned by lot. Subdivision of the little crofts among sons
and grandsons followed, owing to inheritance without re-
clamation. Fairness gave 'the patchwork quilt' described;
but it was fairness pushed to the point of folly, for differ-
ences in soil from one adjacent strip to another were slight!
It is otherwise with the long, narrow plough-strips which
run from the houses on the pure boulder clay down to the
sandy shore: run-rig, movable or fixed, is understandable
and necessary there. The case just cited shows how a
sensible communal tradition, such as that of '*movable*
run-rig' with periodic pooling, may degenerate into ab-
surdity by fixation. Happily the machar still shows the
sane maintenance of a tradition, the pooling of resources:[1]

182 In 1924–25, widespread distress in the Isles, the failure
161 of the Leverhulme endeavour, the crofters' refusal to own
their own crofts, and the emigration which followed, caused
many outsiders to forecast rapid depopulation. It was all
182 the more interesting to note the confidence in the Island's
161 future shown by buyers of the great estate, all of whom
471 knew what they were about, for they were men with
experience of the Island, of its rates and rentals and of its
people. To a wealthy man who repurchased a sporting

(113) [1] Apportionment of lands held in run-rig in the Carloway estate is described, and the principle discussed, in *Scottish Land Court Reports*. (See *Scottish Law Rev.* vol. 28, 7; July 1949, pp. 51-54.) At the same time 'mechanisation', or the co-operative utilisation of tractors had led to pleas for 'collective farming'. (*Stornoway Gazette*, February 1944.)

178 exists at Tarbert and another was erected in 'the Bays'
286 district by Leverhulme. Leverhulme also appears to
have introduced 'Automatic' hand-looms into Lewis.
• [423] Today as in the past, the weavers possess a little croft or
[422] a feu, a cow, and a few sheep on the outrun, and perhaps
a small boat.

121 Commercial fishing and weaving cannot, however, be
286 satisfactorily combined, for seasonal alternation of occupa-
228 tion entails waste of gear and plant, and interferes with
182 efficiency. Thus in the North Lochs fishing 'creek'
178 (Leurbost neighbourhood, immediately south of Storno-
[501] way), weaving became important, but none of the seven
large herring fishing boats (still registered in 1930) had
been fitted with motors after 1918; they were idle and
rotting, and by 1938 only one was still registered. In South
Lochs, however, motor-boats were purchased, but there
is little weaving. An obvious reason for the difference is
the accessibility of the North Lochs area by road to
[493] Stornoway. Light passenger cars bring yarn to the village,
besides groceries, etc., and take away rolls of tweed. South
Lochs, on the other hand, considerably further from
Stornoway by road, is still within reach for marketing fish.
In North Lochs, merchant seamen at home and young men
on their return from three months' work on East Coast
fishing boats, turned increasingly to the 'Automatic' looms,
manipulation being easily learnt; but such intermittent
work alone gives little hope of progress. There is no more
fascinating problem than the future of improved weaving.

2. *Unemployment and the Island Budget*

174 In the past, the storms of the Atlantic washed up on
731 the Island shores the wreckage of world commerce; and
434

(c) THE OUTLOOK: 1939–54 AND SINCE

458 How then can the situation be assessed, as it was before
178 the outbreak of war and since then? By 1939 twenty years
had been partly lost; for the after-war years of the 'Lever-
hulme boom' were followed by discouragement and
poverty. During that time one might have hoped for half
• [423] a generation of reconstruction and progress. On the other
hand the sore question of dividing the farms was settled,
so bringing raiding to an end. Congestion on the existing
crofts is less than it was, owing to this fact, and to the
[166] provision of feus. The poverty of many breadwinners
who had migrated to the cities first cut down the amounts
remitted to their Island dependents, then drove them home.
[433] A croft, or even a garden site, and the opportunity of
building a good house there made life still worth while,
[246] when other employment had failed. Unemployment
relief, though tempting some to idleness, gave a respite
[286] which many utilised to make a fresh start. As fishing
[226] waned, many had taken advantage of the easy beginning
offered to learn a new trade—weaving. This has made
many feel that the living to be found on the Island is
better than alternation of 'wage-earning' with unemploy-
ment, in Glasgow or abroad. They believe the situation
[311] of the Island community to be hopeful. While the land
remains little better than before, many, even of the younger
people, still care for the Island life among their own kin.
Given a clear lead, these could reorganise themselves, and
undertake the developments needed in fishing, weaving
and reclamation. The homes are sound, 'good neigh-
bourhood' endures, and given fresh opportunity, the
community could awaken to new life.

178 During and since the war, co-operative marketing was
44
476

177 most of the young men of the Islands were away. Hitherto,
[464] though people from the Isles had gone out into the world
and rubbed shoulders with all sorts of men and women,
from best to worst, their own homes and townships had
remained inviolate. Now, however, there came men in
numbers from distant homes, with little to do when off
duty and with money to spend, either on tweeds, which
were virtually free of controls, or on pleasures, if they
could find them. The temptations offered to a community
so unaccustomed to town ways were considerable.

729 Those who returned least changed in their outlook upon
178 rural life were ex-prisoners-of-war, from the 51st Highland
Division. At their own wish, they had received instruction
• [423] in modern small-holding; and the demand from prison
camps for land when the Highlanders would come home
was upheld. It is especially among these men that agencies
such as *An Comunn Gaidhealach* kept Gaelic tradition alive,
linking it to the Highlanders' long thoughts of home. Next
to these come naval seamen, while those most subject to
urban influences were those who worked in factories. But
whatever their experiences, home exerted a strong attrac-
tion. If work and a fair wage can be found in the township
and on the crofts, and if social life can be renewed, many
who returned will stay.

726 As in the First World War, so in the Second: few
communities in Britain have had so large a proportion of
their men in the Forces, in the fighting line and at sea,
[177] from the outbreak of hostilities. The Island community
[167] is almost without the exemptions due to 'essential occu-
[727] pations' such as commercial agriculture in the country, or
war industry and administration in the towns. The toll
has been heavy, and the nation's debt to the Islanders
should be remembered.

APPENDIX III

(A) THE STORNOWAY TRUST: A COMMUNAL OPPORTUNITY

632 THE people of Stornoway town and rural parish are in a
175 position to control their own future to a degree unusual in
178 Britain since the general loss of common lands in the eighteenth
century. Three or four bodies or groups are important in
local governance, and in addition to these an effort to arouse
632 citizenship has taken shape in the Lewis Association. As else-
623 where, the Town Council acts for the burgh and, it should be
added, the Grazing Committees for the townships, the District
• 423 Council and County Council acting for wider spheres. The
361 Harbour Trust has its special charge. In addition, the fact of
corporate ownership is important, as vested in the Stornoway
Trust. Besides property in the burgh and its suburbs, including
the Castle and its park or policies, the Trust owns virtually
the whole landward area of the parish, from Arnish Moor north
to Tolsta. It should not be forgotten that the resources of the
sea are public property and that the inshore fishings, owing to
a considerable measure of protection, are virtually in the pos-
session of the coastal communities. Freshwater fishing is also
in the hands of the Trust. Thus, not only building property
but essential sources of production on land and sea are in
communal possession. The Trust was formed in 1924.

623 During the first five years of its existence the Trust was
433 burdened with a growing deficit, but since 1929 it accumulated
a credit balance, due partly to agricultural derating and partly
to the registration of the Trust as a charity and the resulting
relief from income tax. Possession without prevision can do
little, however; and hence the need for the citizens of town
and country to regroup themselves as thinkers for the common

TABLE 37

The Crofting Structure Re-organised

(a) Holdings

District	Proportion of holdings grouped according to area of tenure held: 0 - 5 acres	5 - 10 acres	10 - 50 acres	All units
North Dig	49%	36%	15%	100% (197)
Berneray	14%	27%	59%	100% (109)
East Loch Bong	5%	36%	59%	100% (112)
Carloway	19%	29%	52%	100% (155)
WHOLE PARISH	20%	32%	48%	100% (629)

Note: These are the registered crofts and similar agricultural tenancies as on the 1958 valuation roll. About 50 holdings omitted for lack of data.

(b) Effective agricultural units

District	Proportion of units grouped according to area of tenure held: 0 - 5 acres	5 - 10 acres	10 - 50 acres	All units
North Dig	33%	34%	33%	100% (169)
Berneray	33%	30%	36%	100% (109)
East Loch Bong	33%	39%	28%	100% (130)
Carloway	41%	30%	29%	100% (155)
WHOLE PARISH	36%	33%	30%	100% (563)

Note: About 20 units omitted for lack of data.

(c) Summary (excluding Carloway, see note)

	Proportion of holdings (generally registered crofts).	Proportion of effective agricultural units.
Under 5 acres	19%	17%
5 acres and over	28%	53%
All holdings/units	100% (474)	100% (400)

Note: The Carloway District is here excluded because about 30 small de facto agricultural units exist there after the effect of official amalgamation of ex-Ther-tenancies.

[Derivig] [Cuibos]

In conclusion, it may be said that the problem of starting's future, and that of other crofting townships, is not only one of adverse aspects, but also of secular change, and of the future of crofting in general. The problem of the future of crofting is one of finding a stable and viable level where agricultural units are large enough to encourage the active and enterprising section of the population to remain, and a problem of finding capital to equip a modern fishing fleet.

CALBOST

Anne Cooper

Calbost is situated five miles to the north-east of Crossbost on the Minch coast of Park. It occupies a basin-like hollow in the centre of which is Loch Dubh, and is open to the sea on the east. The crofting township is located over a small area of land, which has been cleared from the slopes of the hollow and along the valleys which enter the township to the north and south-west.

The cultivable soil is mixture of peat and sand, and is generally fertile. It is in the higher ground, although here the rush occurs in many places. On lower ground, cultivated, bracken is spreading rapidly and now covers a large proportion of the township. Although cultivation in thirty years ago it was unknown. Heather dominates the common pasture and rushes are widespread on the low-lying wind-breaks. There are a few willows and rowans round the old buildings, probably planted as wind-breaks.

Calbost was originally a single farm but the township was formed about 1820. The pattern of the farmers differs from the normal township pattern. Instead of a single farm with a number of crofts in the valley which enters from the north, when a part of the common grazing was brought within the township ship. There are now between crofts of which the farmers are distinguished by number crofters and two by equestors. The remainder are used only for hay and grazing and are sub-let to crofters in Calbost and other townships.

Cultivation is entirely by spade and of the 2.6 acres now in cultivation, potatoes account for 2.37 acres. The small acreage of oats reflects the greatly reduced cattle stock of only two cows and two calves. Approximately twelve acres of hay are cut at winter feed for the 225 sheep which graze in the township.

The hay-lofts in natural hay and the outrun are being rapidly encroached on by bracken. The prevalence of bracken, and the amount of work needed to keep it in check, is likely to deter any attempt at renewed cultivation.

Calbost was originally a fishing township in spite of its harbour being so exposed: boats have to be taken up on the shore instead of being moored in the bay. The decline of the fishing industry which has prevailed in Lewis has contributed towards the almost complete desertion of Calbost, leaving only a few boats now used only for leisure purposes. Croft income is supplemented by only two of the men in the township, one a weaver and the other in the Merchant Navy. Although there are a few productive gardens, no attempt is made to market any produce.

The township dyke is very close to the settlement and in the past shielings were not as widely used in Calbost as elsewhere. The cattle were instead brought near to the dyke for milking and allowed to graze on the common unattended. There are ruins of shielings to be found on the hills around Calbost but a more interesting feature is the second dyke: enclosures were made enclosing the main dyke and in the late summer the cattle were brought to fresh pasture within these dykes before the opening of the township gates. Following the opening of the gates the stock are free to wander over all crofts but there seems today to be a move towards the complete enclosure of the crofts.

or summer pasture for the tenants of Lazay and Ranish respectively, townships on the north shores of the loch. In 1775, there were four tenants in Kershader, but their place of origin is unknown. In 1805, the tenants are recorded as being two of Ness from Uig in 1824 there were 10 tenants. Thus the growth of population in Lewis during the second half of the eighteenth century may well have been the major reason for the colonization of one of the least agriculturally attractive districts of the island.

From Figure 1, which shows most of the thirty-four occupied places south of Loch Shell about 1828, it is evident that crofting townships had scattered south into the mountainous area. The existence, which commenced in Harris in 1816, may have increased the population already there by as much as 1640. for some of these townships the population was 1640 in 1841 and 1841 in 1851. Thus the population in South Park speak of a vigorous community. It is possible that South Park was more densely populated than the present area up till 1800.

During the period 1818 to 1842, when the greater, Donald Stewart, and his brothers had a lease of South Park, most of these settlements were cleared (Fig 2) in addition, between 1838 and 1843, 50 tenants in Bunavoneadar were evicted, 30 in Aird Mhor, 30 in Scarasta, 30 in Drinishadder, Bunavoneadar and Ingisv were removed. in all about 436 people. Some 27 families were sent to Crossbost in North Lewis, where was in Tong in Bernera in Pentalch, and some emigrated. The main body of those evicted settled in the township in North Park: Marivig in 1838 had 5 tenants by 1850, 22 are recorded. Thus the growth of population crystallised about 1840 and by then the township along the shore of Loch Erisort from Helmet to Garryard were well established. The Minch coast township from Cromore to Grosebay, first settled about 1800, were greatly expanded, and Park south of Grosebay became a sheep grazing devoid of wind-breaks.

In 1844, the Seaforth family, which had held Lewis for over two centuries, sold the island to Sir James Matheson. The estate was carefully managed and a study of its crofts were aimed extra land in the valley which enters from the north. when a part of the common grazing was brought within the township ship. There are now between crofts of which the farmers are distinguished by number crofters and two by equestors. The remainder are used only for hay and grazing and are sub-let to crofters in Calbost and other townships.

Cultivation is entirely by spade and of the 2.6 acres now in cultivation, potatoes account for 2.37 acres. The small acreage of oats reflects the greatly reduced cattle stock of only two cows and two calves. Approximately twelve acres of hay are cut at winter feed for the 225 sheep which graze in the township.

The hay-lofts in natural hay and the outrun are being rapidly encroached on by bracken. The prevalence of bracken, and the amount of work needed to keep it in check, is likely to deter any attempt at renewed cultivation.

Calbost was originally a fishing township in spite of its harbour being so exposed: boats have to be taken up on the shore instead of being moored in the bay. The decline of the fishing industry which has prevailed in Lewis has contributed towards the almost complete desertion of Calbost, leaving only a few boats now used only for leisure purposes. Croft income is supplemented by only two of the men in the township, one a weaver and the other in the Merchant Navy. Although there are a few productive gardens, no attempt is made to market any produce.

The township dyke is very close to the settlement and in the past shielings were not as widely used in Calbost as elsewhere. The cattle were instead brought near to the dyke for milking and allowed to graze on the common unattended. There are ruins of shielings to be found on the hills around Calbost but a more interesting feature is the second dyke: enclosures were made enclosing the main dyke and in the late summer the cattle were brought to fresh pasture within these dykes before the opening of the township gates. Following the opening of the gates the stock are free to wander over all crofts but there seems today to be a move towards the complete enclosure of the crofts.

While the Royal Commission of 1883-4 was investigating Crofting conditions in Scotland, the farm of Scalpaidhean and Shiadabhaig was restored to its crofters. Six years later, the Royal Commission of England, Scotland and Wales recommended the following land settlements for new crofting townships: Bloomsvaig, Eilean Calum Cille, Crobeg, and the island of Oronsaigh. Bloomsvaig, a total area of 3,000 acres, was to have 60 crofts ranging from 165 acres of arable and 40, 135 acres of grazing in the Park Deer Forest were scheduled as land suitable for the extension of crofting townships. The Royal Commission recommended the extension of the Lewis, it cannot be left out of view that the congestion is very great, and the demand by crofters for access to lands now scheduled is of a very urgent nature. The Deer Forest Commissioners do not believe that the lands now scheduled are suitable for new holdings. but were the lands assigned as land settlements, the congestion would be of much advantage to the occupants and more than outweigh the disadvantages. As a result of this recommendation, the islands of Berneray, Oronsaigh and Ishkair, in all 99 of the 63,728 acres scheduled, were given to Marivig, Calbost, and Bloomsvaig, respectively,as additions to the crofting townships comprising Crobeg, Oronsay and Bloomsvaig, and the Deer Forest were left undisturbed.

In 1916, after crofting, Bloomsvaig was reconstituted as a crofting township. all but one of the new tenants coming from the neighbouring township of Carloway. A parallel attempt was made by equestors who had built houses at Bloomsvaig, to have their unofficial lots recognised, but some families remained there till 1945. In 1934, fifteen small lots were cut out of the Grotir common pasture to relieve pressure on the Grotir crofts: the Department of Agriculture scheme marked the end of a century of crofting in the township.

In 1884, the Seaforth family, which had held Lewis for over two centuries, sold the island to Sir James Matheson. The estate was carefully managed and a study of its crofts were aimed extra land in the valley which enters from the north. when a part of the common grazing was brought within the township ship. There are now between crofts of which the farmers are distinguished by number crofters and two by equestors. The remainder are used only for hay and grazing and are sub-let to crofters in Calbost and other townships.

Cultivation is entirely by spade and of the 2.6 acres now in cultivation. potatoes account for 2.37 acres. The small acreage of oats reflects the greatly reduced cattle stock of only two cows and two calves. Approximately twelve acres of hay are cut at winter feed for the 225 sheep which graze in the township.

The hay-lofts in natural hay and the outrun are being rapidly encroached on by bracken. The prevalence of bracken, and the amount of work needed to keep it in check, is likely to deter any attempt at renewed cultivation.

Calbost was originally a fishing township in spite of its harbour being so exposed: boats have to be taken up on the shore instead of being moored in the bay. The decline of the fishing industry which has prevailed in Lewis has contributed towards the almost complete desertion of Calbost, leaving only a few boats now used only for leisure purposes. Croft income is supplemented by only two of the men in the township, one a weaver and the other in the Merchant Navy. Although there are a few productive gardens, no attempt is made to market any produce.

The township dyke is very close to the settlement and in the past shielings were not as widely used in Calbost as elsewhere. The cattle were instead brought near to the dyke for milking and allowed to graze on the common unattended. There are ruins of shielings to be found on the hills around Calbost but a more interesting feature is the second dyke: enclosures were made enclosing the main dyke and in the late summer the cattle were brought to fresh pasture within these dykes before the opening of the township gates. Following the opening of the gates the stock are free to wander over all crofts but there seems today to be a move towards the complete enclosure of the crofts.

THE PATTERN OF CROFTING
